According to the landowners' return of 1872-3, the total number of proprietors in the county was 21,804, possessing 441,060 acres, with a gross annual estimated rental of £1,685,736 [$8,192,676.96]. Of the owners, only 5796 possessed one acre or upwards. There were also 3415 acres of waste lands. The following are the names of the larger landowners: earl of Dudley, 14,699 acres; earl of Coventry, 13,021; Earl Beauchamp, 10,624; Lord Windsor, 8519; Harry F. Vernon, 7448; Earl Somers, 6265; Lord Lyttleton, 5908; the Ecclesiastical Commissioners, 5213; R. Berkeley, 4812; Duc D'Aumale, 4604; Sir John Pakington, 4868; Lord Northwick, 4215; and Sir F. Winnington, 4196.

Industries.—Agriculture in its various branches is the principal industry of the county. Its mineral wealth consists of coal, iron, and salt; and a considerable number of people find employment in the quarries of limestone around Pershore and Evesham, and at other quarries of freestone and flagstone. There is not much mining in the county; the largest number of artisans are employed in the various hardware trades, as the making of nails, at Halesowen and the neighboring villages, and of needles at Redditch, Astwood Bank, and elsewhere. Glass is largely produced at Dudley and Stourbridge. Worcester is famous for its porcelain, its gloves, and its coach-building, and Kidderminster for its carpets. The salt works at Droitwich are as old as the Roman occupation, and there are others at Stoke. There are a large variety of other trades, including crate making, coke burning, alkali, vinegar, and vitriol works, button making, leather staining, paper making, and tanning.

Communication.—The county is well provided with railways and canals. The roads are good, and the means of intercourse and communication are excellent.

Administration and Population.—Worcestershire comprises five hundreds (Halfshire, Doddingtree, Oswaldslow, Pershore, and Blackenhurst), the city of Worcester, and the municipal boroughs of Bewdley, Droitwich, Dudley, Evesham, and Kidderminster. There are eleven market towns. The city of Worcester has a separate court of quarter sessions, and a commission of the peace, and all the boroughs have commissions of the peace. It is in the Oxford circuit; the assizes as well as quarter sessions are held at Worcester. There is one court of quarter sessions in the whole county, and there are sixteen petty sessional divisions. The shire contains 243 civil parishes, and is mostly in the diocese of Worcester, but partly in that of Hereford. The principal places besides the city of Worcester are Bewdley (population 3088 in 1881), Bromsgrove (12,813), Droitwich (3761), Dudley (46,252), Evesham (5112), Halesowen (7763), Kidderminster (24,270), Oldbury (18,841), Redditch (9961), Stourbridge (9757), and Tenbury (2083).

By the Redistribution Act of 1885, the county was divided into three parliamentary boroughs and five county divisions. The boroughs, each returning one member, are Dudley, Kidderminster, and Worcester; the county divisions are West (Bewdley), East, South (Evesham), Mid (Droitwich), and North (Oldbury). The population in 1861 was 307,397; in 1871, 338,837; and in 1881, 380,283 (males 184,205, females 196,078). The number of persons to an acre was 0.80, and of acres to a person 1.24.

History.—Worcestershire was not a district of much importance in the days of the Roman occupation of Britain. By occupying Gloucester the Romans held the valley of the lower Severn, and thence their roads ran to Hereford, and not till *Uriconium* (Wroxeter) on the side of the Wrekin did they regard the Severn valley as again habitable. This was due to the fact that the greater part of the district now contained in Worcestershire was forest and jungle, not inviting occupation to the colonist. Here and there the Romans held a military outpost, as at Worcester, keeping on the east side of the river; but the west side was left to the Britons, who found a home on the summits of the Malvern Hills. It was long before the English invaders thought the Severn valley worthy of their arms; but in the beginning of the 7th century the tribe of the Hwiccas was in possession of the lands now contained in Warwickshire, Worcestershire, and Gloucestershire. The Hwiccas formed part of the Mercian kingdom, and when Archbishop Theodore undertook the ecclesiastical organization of England he set up at Worcester a bishop of the Hwiccas, and the diocese of Worcester continued to mark the limits of the Hwiccan territory till Henry VIII. founded the separate see of Gloucester.

The church was the main instrument of civilization in Worcestershire. The abbey of Evesham was the centre of agricultural life along the valley of the Avon; the priory of Malvern began the clearing of the forest which reached from the hills to the Severn. Many other religious houses were spread over the county. There were no great barons, as much of the land was given in early times to the church, and much consisted of forest which was only slowly cleared. The bishop of Worcester was the undoubted head of the district, and provided for its defence. The chief historical event connected with the county in the Middle Ages, the battle of Evesham, was owing to the fact that Walter de Cantilupe, bishop of Worcester, was a firm friend and adherent of Simon de Montfort in his opposition to the misgovernment of Henry III. When Earl Simon had seized the king's person in the battle of Lewes, the chief opposition to his government was raised by the lords marchers on the Welsh borders. Simon went to Hereford for the purpose of reducing them to submission; but Edward's escape from captivity gave them a leader, and awakened the hopes of the royalists. Simon sent for reinforcements, but his son was surprised and cut off at Kenilworth. Ignorant of the fact, but afraid to wait any longer lest the passage of the Severn should be closed against him, Simon withdrew to the friendly territory of the bishop of Worcester, and took up his abode in the abbey of Evesham. There in 1265 he was surprised by Edward, and died fighting a hopeless fight.

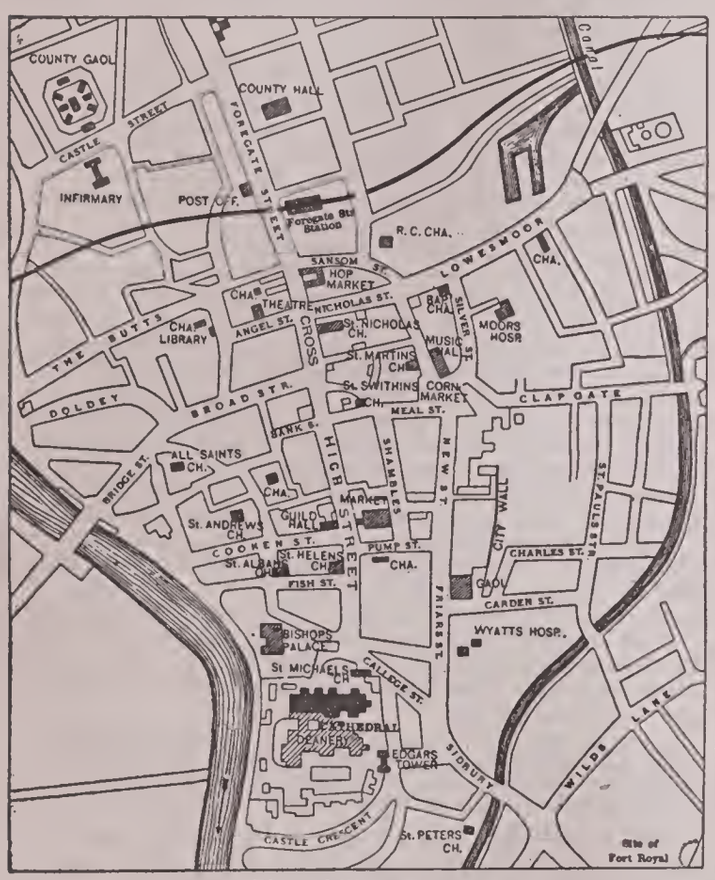
As Wales became more settled, Worcester developed its trade slowly. From early times the salt mines at Droitwich were worked, and a "salt-way" was made for the carriage of their produce. A trade with Wales and Bristol was established, and clothiers sent their wares from Bewdley and Worcester down the Severn. The dissolution of the monasteries affected very seriously a district which was so closely connected with the church, and it was some time before it recovered from the shock which its social life then received. In the great civil war Worcestershire, in common with the west of England, was Royalist, and suffered considerably from the Parliamentary forces. In 1651 Charles II. with the Scottish army marched to Worcester, where he was welcomed by the citizens. Cromwell followed, and took up his position on the Red Hill, just outside the city gates. Lambert succeeded in passing the Severn at Upton, and drove back the Royalist troops to the neighborhood of Worcester, on the other side of the Severn. Charles determined to take advantage of this division of the Parliamentary army on the two sides of the river, and made an attack on Cromwell's camp. At first he was successful, but Cromwell was reinforced by Lambert's troops from the other side in time to drive back Charles's foot, who were not supported by the Scottish horse. Their rout was complete; Charles managed to escape into the city, where he escaped in disguise, and began his adventurous journey to Boscobel. Since that time Worcestershire has pursued a course of peaceful development.

See Nash, *History of Worcestershire* (2 vols. fol., 1799); Chambers, *Biographical Illustrations of Worcestershire* (1820); Turberville, *Worcestershire in the 19th Century* (1852); Allies, *Antiquities and Folk-Lore of Worcestershire* (1852), and Noake, *Guide to Worcestershire* (1868).

WORCESTER, an episcopal city, municipal and parliamentary borough, the capital of the above county and a county of itself, is situated on the eastern bank of the Severn, 120 miles from London by rail, and a little over 26 from Birmingham.

The principal building and chief glory of the city is the cathedral. The see was founded by the advice of Archbishop Theodore in 673, though, owing to opposition on the part of the bishop of Lichfield, it was not finally established till 780. In its formation the tribal division was followed, and it contained the people of the Hwiccas. The bishop's church of St. Peter's, with its secular canons, was absorbed by Bishop Oswald into the monastery of St. Mary. The canons became monks, and in 983 Oswald finished the building of a new monastic cathedral. After the Norman Conquest the saintly bishop of Worcester, Wulfstan, was the only English prelate who was left in possession of his see. He so far adopted Norman customs as to undertake the building of a great church of stone according to the Norman pattern. In 1088 an incursion of the Welsh stopped his labors for a time, but in 1094 he held a synod in the crypt. Of the work of Wulfstan, the outer walls of the nave, aisles, a part of the walls

of the transepts, some shafts, and the crypt remain. The crypt is apsidal, a style of which there are only four examples in England—Winchester, 1079; Worcester, 1084; Gloucester, 1089; and Canterbury, 1096. Wulfstan's building seems to have extended no farther than the transepts, but the nave was continued, though much of it was destroyed by the fall of the central tower in 1175. In 1203 Wulfstan was canonized, and the monks, growing richer by the offerings at his shrine, finished the cathedral in 1216. Soon after this date they built a lady chapel at the east end, extending the building by 50 feet; then they were so satisfied with their new work that the choir was rebuilt to match in the Early English style. The nave was similarly remodelled in the 14th century, the north side in the Decorated, the south side in the Perpendicular style. The building is cruciform, and is without transept aisles, but has secondary transepts to the choir. The tower is in the centre, and is 162 feet high. There is an interesting chapter house of Late Norman architecture, a round building with its stone roof supported on a central pillar. The refectory is a fine room of Decorated architecture, and the cloisters are Perpendicular. The cathedral was very much out of repair in 1857,



Plan of Worcester.

when the restoration was undertaken by the cathedral architect, Mr. Perkins, in which most of the work of previous generations was wholly swept away, and in some important particulars replaced by conjectural work of Early English style. The cost was about £100,000 [$486,000], raised principally by public subscription, though for four years the dean and chapter had provided the funds required.

In the cathedral are several good monuments and monumental effigies. That of King John, in the choir, is the earliest sepulchral effigy of an English king in the country. There is an altar tomb, in a chantry chapel, of Arthur, prince of Wales, son of Henry VII., who died in 1503. There are also monuments of John Gauden, the bishop who wrote *Icon Basilike*, so often attributed to Charles I., of Bishop Hough by Roubillac, and of Mrs. Digby by Chantrey. There are many other monuments; and in the north alley of the cloister is a stone on which is cut the sad and significant word "Miserrimus," and nothing more—a tragedy in a single word.

There are eleven parish churches in the city: St. Helen's, the oldest, was rebuilt in 1820; St. Albans, ancient, partially restored in 1850; All Saints, built in 1740, which contains a peal of ten bells; St. Andrews, repewed in 1850; St. Nicholas, began in 1728 and finished in 1730; St. Martin's, erected in 1772; St. Swithin's, in 1736; St. Peter's, dating from 1686, which has annexed to it the chapelry of Whittington; St. Michael's, in Bedwardine, modern; St. John's, Bedwardine, made a parish church in 1371; and St. Clement's, built in 1823. In 1874 a parish was formed out of Claines, named the Tything, and in 1876 the church (St. Mary Magdalene) was built; St. Paul's was built in 1837, and constituted a separate parish in 1844; St. George's, built by subscription in 1830, was made a parish out of Claines, in 1862; Holy Trinity, erected in 1865, was formed a parish in 1866. There are also a Roman Catholic Chapel and places of worship for all descriptions of Dissenters.

There are no remains of the old castle of Worcester; it adjoined the monastery so closely that King John gave its yard to the monks, and after that time it ceased to be a stronghold. The Commandery, founded by St. Wulfstan in 1095, is one of the "rarest specimens of early house architecture in existence." The hall contains an open timber roof of the time of Henry VII., "a good bay window, a fine door, the projecting canopy of the dais, a music-screen and gallery, and some fragments of stained glass." The cathedral grammar school, founded by Henry VIII. in 1541, occupies the refectory of the old monastery, which has just been restored by Mr. Christian, and has many interesting architectural features.

The guild-hall, built in 1723, is an admirable building in the Italian style; it contains a portrait of George III., painted by Sir Joshua Reynolds, and presented by the king to commemorate his visit to the city at the triennial musical festival in 1788. The corporation possess some very interesting old charters and manuscripts, and good municipal regalia. The shire-hall, erected in 1835 at a cost of £35,000 [$170,100], is a fine stone building in the Ionic style, with a portico supported by six fluted columns. The county jail, built in 1809 at a cost of £19,000 [$92,340], was entirely reconstructed on the separate principle in 1860, at a further cost of £24,000 [$116,640]. The infirmary was built in 1770, the dispensary in 1822, and the ophthalmic institution in 1866. There is a museum of natural history; and a free library was opened in 1881. Worcester has long been famous for several important branches of industry. The Clothiers' Company possess a charter granted by Queen Elizabeth; but the great industries are now the manufacture of gloves and of porcelain. A company of glovers was incorporated in 1661; it is principally occupied with the making of skin gloves, in which the skins of deer, sheep, lambs, goats, and kids are used. The manufacture of porcelain was introduced by Dr. Wall, a Worcester physician, in 1751 (see vol. xix. p. 662). The materials employed are china clay and china stone from Cornwall, felspar from Sweden, fire-clay from Stourbridge and Broseley, marl, flint, and calcined bones. Pickles and sauces are among the notable productions of the city: and among its other trades are those of carriage making, rope and twine spinning, boat and barge building, tanning, and the production of chemical manures and of cider and perry.

The charities of Worcester are numerous, and include St. Oswald's hospital, Nash's almshouses, Wyatt's almshouses, the Berkeley hospital, Goulding hospital, Shewring's hospital, Inglethorpe's almshouses, Waldgrave's almshouses, Moore's blue-coat school, Queen Elizabeth's charity, and others, which produce an annual income of more than £10,000 [$48,600]. The population of the city and municipal borough (area 1263 acres) in 1871 was 33,226 and in 1881 it was 33,956. The population of the parlia-

mentary borough (area 3266 acres) in 1871 was 38,116 and in 1881 it was 40,354.

Among the charters still preserved in the guild-hall is one of Richard I. dated November 12, 1189, which grants to the burgesses to hold of the king and his heirs the town of Worcester at a yearly rental of £24 [$320]. In the reign of Philip and Mary[1] the town was raised to the dignity of a city, and this with other privileges was confirmed by Elizabeth in 1558; and in 1622 James I. granted a charter ordaining that the city shall be a free city of itself, and a county separate from all other counties. From the time of Edward I. until 1885 Worcester returned two members to parliament, but the number was then reduced to one. Municipally the city is divided into five wards. The county assizes are held in the city, as are also the quarter sessions, the county court, the borough court, town and county petty sessions, and the ecclesiastical and probate court.

The Romans found a British settlement and held it as a military station, to which they gave the name *Vigorna*. By the Saxons it was called Wigorna-ceaster, whence we have the present name of Worcester. It was more than once burnt and pillaged by the Danes, but at the date of the conquest it was of sufficient importance to have a mint. From its proximity to Wales, it frequently suffered from the inroads of the Welsh. It was taken by the empress Maud, and retaken by Stephen, after severe contests. The king kept the Easter week there in 1139.—as it is recorded, with "great pomp"; and in 1234 Henry III. held the Whitsuntide festival in the city. Queen Elizabeth rested there in one of her progresses; in 1687 James II. came, and touched for the king's evil. He attended mass in the Catholic chapel; but the mayor and the corporation, though accompanying him to the chapel door, firmly and patriotically declined to enter.

For the part this city took in the great civil war see p. 701.

WORCESTER, a city and one of the county seats of Worcester county, Massachusetts, United States, is situated in a region of Glacial hills, lakes, and ponds, which form varied and pleasing landscapes, 39 miles west of Boston. Besides the closely built portion, the city includes a large suburban district, which contains fourteen villages of various sizes. The closely-built portion is very irregularly laid out, conforming in some degree to the slope of the ground. There are 197 miles of streets, very little of which is paved. The public parks have an aggregate area of 35 acres. The population in 1885 was 68,389 (20,182, or 29.51 per cent. of foreign birth). The proportion of colored people was very small. The manufacturing industries are very large and varied; prominent among them are the manufactures of iron and steel, foundry and machine shop products and tools, and second to these the manufacture of boots and shoes.

The settlement of Worcester began in 1713. Earlier attempts had been made, but the incursions of Indians had frustrated them. It was incorporated as a town in 1722, but made very slow progress in growth until the completion of the Boston and Worcester (now Boston and Albany) Railroad in 1835. Since that date, with the extension of its railroad connections, it has developed rapidly. In 1848 it received a city charter, and at present it is the third city of the State in population and wealth. The population, which in 1765 was 1478 and in 1790 was 2095, rose to 4173 in 1830, 7497 in 1840, 17,049 in 1850, 41,105 in 1870 and 58,291 in 1880.

WORCESTER, Florence of. See vol. ix. p. 295.

WORDSWORTH, William (1770–1850), the poet, was born at Cockermouth, on the Derwent, in Cumberland, on the 7th of April, 1770. His parentage offers a curious parallel to Scott's: he was the son of an attorney, law-agent to the earl of Lonsdale, a prosperous man in his profession, descended from an old Yorkshire family of landed gentry. On the mother's side also Wordsworth was connected with the middle territorial class: his mother, Anne Cookson, was the daughter of a well-to-do mercer in Penrith, but her mother was a Crackanthorpe, whose ancestors had been lords of the manor of Newbiggin, near Penrith, from the time of Edward III. He was thus as Scott put it in his own case, come of "gentle" kin, and like Scott he was proud of it, and dictated the fact in his short fragment of prose autobiography. The country squires and farmers whose blood flowed in Wordsworth's veins were not far enough above local life to be out of sympathy with it, and the poet's interest in the common scenes and common folk of the North country hills and dales had a traceable hereditary bias.

Though his parents were of sturdy stock, both died prematurely, his mother when he was five years old, his father when he was thirteen, the ultimate cause of death in his mother's case being exposure to cold in "a best bedroom" in London, in his father's exposure on a Cumberland hill, where he had been befogged and lost his way. At the age of eight Wordsworth was sent to school at Hawkshead, in the Esthwaite valley in Lancashire. His father died while he was there, and at the age of seventeen he was sent by his uncle to St. John's College, Cambridge. He did not distinguish himself in the studies of the university, and for some time after taking his degree of B.A., which he did in January, 1791, he showed what seemed to his relatives a most perverse reluctance to adopt any regular profession. His mother had noted his "stiff, moody, and violent temper" in childhood, and it seemed as if this family judgment was to be confirmed in his manhood. After taking his degree, he was pressed to take holy orders, but would not; he had no taste for the law; he idled a few months aimlessly in London, a few months more with a Welsh college friend, with whom he had made a pedestrian tour in France and Switzerland during his last Cambridge vacation; then in the November of 1791 he crossed to France, ostensibly to learn the language, made the acquaintance of revolutionaries, sympathized with them vehemently, and was within an ace of throwing in his lot with the Brissotins to give them the steady direction that they needed. When it came to this his relatives cut off his supplies, and he was obliged to return to London towards the close of 1792. But still he resisted all pressure to enter any of the regular professions, published *An Evening Walk* and *Descriptive Sketches* in 1793, and in 1794, still moving about to all appearance in stubborn aimlessness among his friends and relatives, had no more rational purpose of livelihood than drawing up the prospectus of a periodical of strictly republican principles to be called "The Philanthropist." At this stage, at the age of twenty-four, Wordsworth seemed to his friends a very hopeless and impracticable young man.

But all the time from his boyhood upwards a great purpose had been growing and maturing in his mind. *The Prelude* expounds in lofty impassioned strain, treating of simple facts in diction that would be "poetic" beyond the worst extravagances of the panegyrical school but for the genuine emotion that inspires its amplitude of phrase, how his sensibility for nature was "augmented and sustained," and how it never, except for a brief interval, ceased to be "creative" in the special sense of his subsequent theory. But it is with his feelings towards nature that *The Prelude* mainly deals; it says little regarding the history of his ambition to express those feelings in verse. It is the autobiography, not of the poet of nature, but of the worshipper and priest. The salient incidents in the history of the poet he communicated in prose notes and in familiar discourses. And it appears that, while he was still a schoolboy of fourteen, the delight that he took in contemplating and moralizing from nature was mingled with the enthusiasm of a poet's ambition and joy in the discovery of a fresh imperfectly worked field. Commenting on the couplet in the *Evening Walk*—

> "And, fronting the bright west, yon oak entwines
> Its darkening boughs and leaves in stronger lines—"

he said:

[1] [That is Mary Tudor, who married Philip II. of Spain.—Am. Ed.]

"This is feebly and imperfectly exprest; but I recollect distinctly the very spot where this first struck me. It was on the way between Hawkshead and Ambleside, and gave me extreme pleasure. The moment was important in my poetical history; for I date from it my consciousness of the infinite variety of natural appearances which had been unnoticed by the poets of any age or country, so far as I was acquainted with them; *and I made a resolution to supply in some degree the deficiency.* I could not at that time have been above fourteen years of age."

About the same time he wrote, as a school task at Hawkshead, verses that show considerable acquaintance with the poets of his own country at least, as well as some previous practice in the art of verse-making.[1] The fragment that stands at the beginning of his collected works, recording a resolution to end his life among his native hills, was the conclusion of a long poem written while he was still at school. And, undistinguished as he was at Cambridge in the contest for academic honors, the *Evening Walk*, his first publication, was written during his vacations.[2] He published it in 1793, to show, as he said, that he could do something, although he had not distinguished himself in university work. It is significant of his persistency of purpose that in this poem, as well as in the *Descriptive Sketches* founded on his tour abroad during his last vacation, he is seen to be steadily fulfilling his resolution to supply defects in the minute description of nature. There are touches here and there of the bent of imagination that became dominant in him soon afterwards, notably in the moral aspiration that accompanies his *Remembrance of Collins* on the Thames:

> "O glide, fair stream! for ever so
> Thy quiet soul on all bestowing,
> Till all our minds for ever flow
> As thy deep waters now are flowing."

But in the main this first publication represents the poet in the stage described in the twelfth book of *The Prelude*:

> "Bent overmuch on superficial things,
> Pampering myself with meagre novelties
> Of color and proportion; to the moods
> Of time and season, to the moral power,
> The affections, and the spirit of the place
> Insensible."

Nature was little more than a picture-gallery to him; the pleasures of the eye had all but absolute dominion; and he

> "Roamed from hill to hill, from rock to rock,
> Still craving combinations of new forms,
> New pleasures, wider empire for the sight,
> Proud of her own endowments, and rejoiced
> To lay the inner faculties asleep."

But, though he had not yet found his distinctive aim as a poet, he was inwardly bent, all the time that his relatives saw in him only a wayward and unpromising aversion to work in any regular line, upon poetry as "his office upon earth."

In this determination he was strengthened by his sister Dorothy, who with rare devotion consecrated her life henceforward to his service. A timely legacy enabled them to carry their purpose into effect. A friend of his, whom he had nursed in a last illness, Raisley Calvert, son of the steward of the duke of Norfolk, who had large estates in Cumberland, died early in 1795, leaving him a legacy of £900 [$4410]. And here it may be well to notice how opportunely, as De Quincey half-ruefully remarked, money always fell in to Wordsworth, enabling him to pursue his poetic career without distraction. Calvert's bequest came to him when he was on the point of concluding an engagement as a journalist in London. On it and other small resources he and his sister, thanks to her frugal management, contrived to live for nearly eight years. By the end of that time Lord Lonsdale, who owed Wordsworth's father a large sum for professional services, and had steadily refused to pay it, died, and his successor paid the debt with interest. His wife, Mary Hutchinson, whom he married in 1802, brought him some fortune; and in 1813, when in spite of his plain living his family began to press upon his income, he was appointed stamp distributor for Westmorland, with an income of £500 [$2450], afterwards nearly doubled by the increase of his district. By this succession of timely godsends, Wordsworth, though he did not escape some periods of sharp anxiety, was saved from the necessity of turning aside from his vocation.

To return, however, to the course of his life from the time when he resolved to labor with all his powers in the office of poet. The first two years, during which he lived with his self-sacrificing sister at Racedown, in Dorset, were spent in half-hearted and very imperfectly successful experiments, satires in imitation of Juvenal, the tragedy of *The Borderers*,[3] and a poem in the Spenserian stanza, the poem now entitled *Guilt and Sorrow*. How much longer this time of doubtful self-distrustful endeavor might have continued is a subject for curious speculation; an end was put to it by a fortunate incident, a visit from Coleridge, who had read his first publication, and seen in it, what none of the public critics had discerned, the advent of "an original poetic genius." It would be impossible to exaggerate the importance for Wordsworth of the arrival of this enthusiastic Columbus. Under his sister's genial influence[4] he was groping his way doubtfully out of the labyrinth of poetic conventions, beginning to see a new pathos and sublimity in human life, but not yet convinced except by fits and starts of the rightness of his own vision. Stubborn and independent as Wordsworth was, he needed some friendly voice from the outer world to give him confidence in himself. Coleridge rendered him this indispensable service. He begun to seek his themes in

> "Sorrow, that is not sorrow, but delight;
> And miserable love, that is not pain
> To hear of, for the glory that redounds
> Therefrom to human kind, and what we are."

He read to his visitor one of these experiments, the story of the ruined cottage, afterwards introduced into the first book of *The Excursion*.[5] Coleridge, who

[1] *Memoirs of William Wordsworth*, by Canon Wordsworth, vol. i. pp. 10, 11. According to his own statement in the memoranda dictated to his biographer, it was the success of this exercise that "put it into his head to compose verses from the impulse of his own mind." The resolution to supply the deficiencies of poetry in the exact description of natural appearances was probably formed while he was in this state of boyish ecstasy at the accidental revelation of his own powers. The date of his beginnings as a poet is confirmed by the lines in *The Idiot Boy*, written in 1798—

> "I to the Muses have been bound
> *These fourteen years* by strong indentures."

[2] In *The Prelude*, book iv., he speaks of himself during his first vacation as "harassed with the toil of verse, much pains and little progress." To the same time belongs an incident recorded later in the same book, when he was returning in early morning from a dance—

> "My heart was full; I made no vows, but vows
> Were then made for me; bond unknown to me
> Was given, that I should be, else sinning greatly,
> A dedicated spirit,"

[3] Not published till 1842. For the history of this tragedy see *Memoirs*, vol. i. p. 113; for a sound, if severe, criticism of it, Mr. Swinburne's *Miscellanies*, p. 118. And yet it was of the blank verse of *The Borderers* that Coleridge spoke when he wrote to Cottle that "he felt a little man by the side of his friend."

[4] The character of Dorothy Wordsworth is shown in the extracts from her Journal printed in the *Memoirs*, and in her *Recollections of a Tour in Scotland*, edited by the late Principal Shairp, 1874. The poet's acknowledgments of obligation to her were not mere grateful words thrown out at random—

> "She gave me eyes, she gave me ears,
> And humble cares, and delicate fears;
> A heart, the fountain of sweet tears,
> And love, and faith, and joy."

The fourteenth book of *The Prelude* especially enables us to understand the full meaning of this eulogium, every word of which has been carefully weighed. This book contains a complete picture of the state of mind in which Coleridge found the poet, when he "seemed to gain clear sight of a new world — a world, too, that was fit to be transmitted and made visible to other eyes."

[5] The version read to Coleridge, however, must have been in Spenserian stanzas, if Coleridge was right in his recollection that it was in the same metre with *The Female Vagrant*, the original title of *Guilt and Sorrow*.

had already seen original poetic genius in the poems published before, was enthusiastic in his praise of them as having "a character, by books not hitherto reflected," and his praise gave new heart and hope to the poet hitherto hesitating and uncertain.

June, 1797, was the date of this memorable visit. So pleasant was the companionship on both sides that, when Coleridge returned to Nether Stowey in Somerset, Wordsworth at his instance changed his quarters to Alfoxden, within a mile and a half of Coleridge's temporary residence, and the two poets lived in almost daily intercourse for the next twelve months. During that period Wordsworth's powers rapidly expanded and matured; ideas that had been gathering in his mind for years, and lying there in dim confusion, felt the stir of a new life, and ranged themselves in clearer shapes under the fresh quickening breath of Coleridge's swift and discursive dialectic. The radiant restless vitality of the more variously gifted man stirred the stiffer and more sluggish nature of the recluse to its depths, and Coleridge's quick and generous appreciation of his power gave him precisely the encouragement that he needed.

The *Lyrical Ballads* were the poetic fruits of their companionship. Out of their frequent discussions of the relative value of common life and supernatural incidents as themes for imaginative treatment grew the idea of writing a volume together, composed of poems of the two kinds. Coleridge was to take the supernatural; and, as his industry was not equal to his friend's, this kind was represented by the *Ancient Mariner* alone. Among Wordsworth's contributions were *The Female Vagrant*, *We are Seven*, *Complaint of a Forsaken Indian Woman*, *The Last of the Flock*, *The Idiot Boy*, *The Mad Mother* ("Her eyes are wild"), *The Thorn*, *Goody Blake and Harry Gill*, *The Reverie of Poor Susan*, *Simon Lee*, *Expostulation and Reply*, *The Tables Turned*, *Lines left upon a Yew-tree Seat*, *An Old Man Travelling* ("Animal Tranquillity and Decay"), *Lines above Tintern Abbey*. The volume was published by Cottle of Bristol in September, 1798.

It is necessary to enumerate the contents of this volume in fairness to the contemporaries of Wordsworth, whom it is the fashion to reproach for their cold or scoffing reception of his first distinctive work. Those Wordsworthians who give up *The Idiot Boy*, *Goody Blake*, and *The Thorn* as mistaken experiments have no right to triumph over the first derisive critics of the *Lyrical Ballads*, or to wonder at the dulness that failed to see at once in this humble issue from an obscure provincial press the advent of a great master in literature. The poems that have not yet won general acceptance even among the most devoted Wordsworthians formed a large part of the whole revelation, and attention was specially drawn to them by the title. While the taste for *The Idiot Boy* is still uncreated, still far from general, while critics of authority can still so completely miss the poet's intention as to suggest that the poem might have been enjoyable if Betty Foy's imbecile son had been described as beautiful and the word "idiot" had not been left to convey uncorrected its repulsive associations, while intimate disciples acknowledge themselves unable to understand the "glee" with which Wordsworth told the simple story, and wonder whether he intended it as a "comic poem,"[1] it may be doubted whether now, after nearly a century of discipleship and exposition, the *Lyrical Ballads* would receive a much more cordial or much wider welcome than they did in 1798. It is true that *Tintern Abbey* was in the volume, and that all the highest qualities of Wordsworth's imagination and of his verse could be illustrated now from the lyrical ballads proper in this first publication; but before we accuse our predecessors of purblindness, corrupt taste, and critical malignity, as is the sweet and reasonable custom of too many professing Wordsworthians,[2] we should remember that clear vision is easier for us than it was for them when the revelation was fragmentary and incomplete.

Although Wordsworth was not received at first with the respect to which we now see that he was entitled, his power was not entirely without recognition. There is a curious commercial evidence of this, which ought to be noted, because a perversion of the fact is sometimes used to exaggerate the supposed neglect of Wordsworth at the outset of his career. When the Longmans took over Cottle's publishing business in 1799, the value of the copyright of the *Lyrical Ballads*, for which Cottle had paid thirty guineas [$153.09], was assessed at *nil*. Cottle therefore begged that it might be excluded altogether from the bargain, and presented it to the authors. But in 1800, when the first edition was exhausted, the Longmans offered Wordsworth £100 [$490] for two issues of a new edition with an additional volume and an explanatory preface. The sum was small compared with what Scott and Byron soon afterwards received, but it shows that the public neglect was not quite so complete as is sometimes represented. Another edition was called for in 1802, and a fourth in 1805. The new volume in the 1800 edition was made up of poems composed during his residence at Goslar in the winter of 1798–99, and after his settlement at Grasmere in December, 1799. It contained a large portion of poems now universally accepted: *Ruth*, *Nutting*, *Three Years She Grew*, *A Poet's Epitaph*, *Hartleap Well*, *Lucy Gray*, *The Brothers*, *Michael*, *The Old Cumberland Beggar*, *Poems on the Naming of Places*. But it contained also the famous Preface, in which he infuriated critics by presuming to defend his eccentricities in an elaborate theory of poetry and poetic diction.

Comparatively few in the present day have actually read and studied this famous document, although it is constantly referred to as a sort of revolutionary proclamation against the established taste of the eighteenth century. For one that has read Wordsworth's original, hundreds have read Coleridge's brilliant criticism, and the fixed conception of the doctrines actually put forth by Wordsworth is taken from this. Now, although the Preface and the extensive and bitter discussion provoked by it had not a tithe of the influence on poetry ascribed to it by a natural liking for sudden changes and simple personal agencies, although the result on literary practice was little more than the banishment of a few overdriven phrases and figures of speech from poetic diction,[3] it is desirable, considering the celebrity of the affair, that Wordsworth's exact position should be made clear. To do this is to contradict several "vulgar errors" on the subject, probably too vulgar and deeply rooted to be affected by any exposure. Coleridge's criticism of his friend's theory proceeded avowedly "on the assumption that his words had been rightly interpreted, as purporting that the proper diction for poetry in general consists altogether in a language taken, with due exceptions, from the mouths of men in real life, a language which actually constitutes the natural conversation of men under the influence of natural feelings." Coleridge assumed

[1] The defect of *The Idiot Boy* is really rhetorical, rather than poetic. Wordsworth himself said that "he never wrote anything with so much glee," and, once the source of his glee is felt in the nobly affectionate relations between the two half-witted irrational old women and the glorious imbecile, the work is seen to be executed with a harmony that should satisfy the most exacting criticism. The poet not only felt but gave complete expression to the most exquisitely tender humor in telling the story of the simple incident. Poetically, therefore, the poem is a success; not a note is out of tune, with the exception, perhaps, of the boisterous ridicule of the romantic ballad in his speculations as to the employment of the lost horseman, otherwise, as a work of art in a rare vein of humorous tenderness elevated by the moral dignity of the subject, *The Idiot Boy* is as perfect as anything that Wordsworth wrote. But rhetorically this particular attempt to "breathe grandeur upon the very humblest face of human life" must be pronounced a failure, inasmuch as the writer did not use sufficiently forcible means to disabuse his readers of vulgar prepossessions.

[2] Herein curiously, if not ridiculously, inconsistent, as their master was not, with his tranquillizing creed.

[3] Sir Henry Taylor, one of the most acute and judicious of Wordsworth's champions, came to this conclusion in 1834.

further that, when Wordsworth spoke of there being "no essential difference between the language of prose and metrical composition," he meant by language not the mere words but the style, the structure, and the order of the sentences; on this assumption he argued as if Wordsworth had held that the metrical order should always be the same as the prose order. Given these assumptions, which formed the popular interpretation of the theory by its opponents, it was easy to demonstrate its absurdity, and Coleridge is very generally supposed to have given Wordsworth's theory in its bare and naked extravagance the *coup de grâce*. But the truth is that neither of the two assumptions is warranted; not only so, but both were expressly disclaimed by Wordsworth in the Preface itself. There is not a single qualification introduced by Coleridge in correction of the theory that was not made by Wordsworth himself in the original statement.[1] In the first place, it was not put forward as a theory of poetry in general, though from the vigor with which he carried the war into the enemy's country it was naturally enough for polemic purposes taken as such; it was a statement and defence of the principles on which his own poems of humbler life were composed, undertaken at the instance of friends interested in "a class of poetry well adapted to interest mankind permanently, and not unimportant in the quality and in the multiplicity of its moral relations." He assailed the public taste as "depraved," first and mainly in so far as it was adverse to simple incidents simply treated, being accustomed to "gross and violent stimulants," "craving after extraordinary incident," possessed with a "degrading thirst after outrageous stimulation," "frantic novels, sickly and stupid German tragedies, and deluges of idle and extravagant stories in verse." This, and not adherence to the classical rule of Pope, which had really suffered deposition a good half century before, was the first count in Wordsworth's defensive indictment of the taste of his age. To make it perfectly clear that he was pleading only for his own maligned and misunderstood poems, he repeated at the close of the Preface that "if his purpose were fulfilled, a species of poetry would be produced which is genuine poetry, in its nature well adapted to interest mankind, etc." It is true that he said also that, "in order entirely to enjoy the poetry which I am recommending, it would be necessary to give up much of what is ordinarily enjoyed;" but the context makes it plain that in so saying he referred to startling incident and gaudy ornament, his own purpose being to make "the feeling give importance to the action and situation, not the action and situation to the feeling," and to use language as near as possible to the language of real life. In the second place, as regards this language of real life, and the "poetic diction," the liking for which was the second count in his indictment of the public taste, it is most explicitly clear that, when he said that there was no essential difference between the language of poetry and the language of prose, he meant words, plain and figurative, and not structure and order, or, as Coleridge otherwise puts it, the "ordonnance" of composition. Coleridge says that if he meant this he was only uttering a truism, which nobody that knew Wordsworth would suspect him of doing; but, strange to say it is as a truism, nominally acknowledged by everybody, that Wordsworth does advance his doctrine on this point. Only he adds, "if in what I am about to say it shall appear to some that my labor is unnecessary, and that I am like a man fighting a battle without enemies, such persons may be reminded that, whatever be the language outwardly holden by men, a practical faith in the opinions which I am wishing to establish is almost unknown;" and what he wished to establish, as may be seen by any person of average intelligence who grapples honestly with his stiff and condensed exposition, and interprets it with reference to the controversy in which it was an incident, was the simple truth that what is false, unreal, affected, bombastic, or nonsensical in prose is not less so in verse. There was no greater heresy than this in Wordsworth's theory of poetic diction. The form in which he expresses the theory was conditioned by the circumstances of the polemic, and readers were put on a false scent by his purely incidental and collateral and very much overstrained defence of the language of rustics, as being less conventional and more permanent, and therefore better fitted to afford materials for the poet's selection. But this was a side issue, a paradoxical retort on his critics, seized upon by them in turn and made prominent as a matter for easy ridicule; all that he says on this head might be cut out of the Preface without affecting in the least his main thesis. The drift of this is fairly apparent all through, but stands out in unmistakable clearness in his criticism of the passages from Johnson and Cowper.

> "But the sound of the church-going bell
> These valleys and rocks never heard,
> Ne'er sighed at the sound of a knell
> Or smiled when a Sabbath appeared."

The epithet "church-going" offends him as a puritan in grammar; whether his objection is well founded or ill founded, it applies equally to prose and verse. Poetic license does not justify bad grammar. Whether this is strictly defensible or not, all the same it illustrates his contention. To represent the valleys and rocks as sighing and smiling in the circumstances would appear feeble and absurd in prose composition, and is not less so in metrical composition; "the occasion does not justify such violent expressions." These are examples of all that Wordsworth meant by saying that "there is no essential difference between the language of prose and metrical composition;" and it is mere pedantry to detach this phrase from the context, and hold him bound by the precise scholastic sense of the word essential to a meaning that he expressly repudiates. So far is Wordsworth from contending that the metrical order should always be the same with the prose order, that part of the preface is devoted to a subtle analysis of the peculiar effect of metrical arrangement, assigning the pleasure proper to this as his reason for writing in verse rather than in prose, and repeating again and again such phrases as "fitting to metrical arrangement a selection of the real language of men in a state of vivid sensation," and "language closely resembling that of real life, and yet in the circumstance of metre differing from it so widely."[2] What he objects to is not departure from the structure of prose, but the assumption, which seemed to him to underlie the criticisms of his ballads, that a writer of verse is not a poet unless he uses artificially ornamental language, not justified by the strength of the emotion expressed. The farthest that he went in defence of prose structure in poetry was to maintain that, if the words in a verse happened to be in the order of prose, it did not follow that they were prosaic in the sense of being unpoetic,—a side-stroke at critics who complained of his prosaisms for no better reason than that the words stood in the order of prose composition. Wordsworth was far from repudiating elevation of style in poetry. "If," he said,

[1] Although Coleridge makes the qualifications more prominent than they were in the original statement, the two theories are at bottom so closely the same that one is sometimes inclined to suspect that parts, at least, of the original emanated from the fertile mind of Coleridge himself. The two poets certainly discussed the subject together in Somerset when the first ballads were written, and Coleridge was at Grasmere when the Preface was prepared in 1800. The diction of the Preface is curiously Hartleian, and, when they first met, Coleridge was a devoted disciple of Hartley, naming his first son after the philosopher, while Wordsworth detested analytic psychology. If Coleridge did contribute to the original theory in 1798 or 1800, he was likely enough to have forgotten the fact by 1814. At any rate he evidently wrote his criticism without making a close study of the Preface, and what he did in effect was to restate the original theory against popular misconceptions of it.

[2] He expressly admitted also that, in the expression of passion, owing to "the tendency of metre to divest language to a certain degree of its reality," a strength of language might be used in verse that good taste would not tolerate in prose.

"the poet's subject be judiciously chosen, it will naturally, and upon fit occasion, lead him to passions the language of which, if selected truly and judiciously, must necessarily be dignified and variegated, and alive with metaphors and figures." But no "foreign splendors" should be interwoven with what "the passion naturally suggests," and "where the passions are of a milder character the style also should be subdued and temperate."

Such was Wordsworth's theory of poetic diction. Nothing could be more grossly mistaken than the current notion, which has been repeated by so many critics of authority that it has become an established belief, that the greater part of Wordsworth's poetry was composed in defiance of his own theory, and that he succeeded best when he set his own theory most at defiance. All commentators on Wordsworth who feel tempted to repeat this pretty paradox should pause and read his own statement of his theory before giving further currency to a misconception which they will see is absurdly unwarrantable. It is traceable to the authority of Coleridge. His just, sympathetic, and penetrating criticism on Wordsworth's work as a poet did immense service in securing for him a wider recognition; but his proved friendship and brilliant style have done sad injustice to the poet as a theorist. It was natural to assume that Coleridge, if anybody, must have known what his friend's theory was; and it was natural also that readers under the charm of his lucid and melodious prose should gladly grant themselves a dispensation from the trouble of verifying his facts in the harsh and cumbrous exposition of the theorist himself.[1] After all, the theory is a minor affair. It is the work that counts: only it is hardly fair to Wordsworth that he should go down as a stupid genius who did right against his own reasoned principles, or an arrogant person who knew himself to be wrong but refused to admit it.

The question of diction made most noise, but it was far from being the most important point of poetic doctrine set forth in the Preface. If in this he merely enunciated a truism, generally admitted in words but too generally ignored in practice, there was real novelty in his plea for humble subjects, and in his theory of poetic composition. We might, indeed, easily exaggerate to ourselves the amount of innovation in mere abstract theory; this might have been insignificant enough but for the turn that was given to it by the poet's individuality. But in view of all that was most distinctive and influential in Wordsworth's own work, his remarks on poetry in general, on the supreme function of the imagination in dignifying humble and commonplace incidents, and on the need of active exercise of imagination in the reader as well as in the poet—passiveness in this particular not being recommended as wise—his remarks on these points are immeasurably more important than his theory of poetic diction. It is much to be regretted that Coleridge's genius for luminous and brilliant exposition was not applied to the development of the few stiff phrases in which Wordsworth sought to generalize his own practice. Such sayings as that poetry "takes it origin from emotion recollected in tranquillity," or that it is the business of a poet to trace "how men associate ideas in a state of excitement," are, like the detached parts of a Chinese puzzle, meaningless till they are pieced together with views of the poet's art expressed and illustrated elsewhere. They are significant of Wordsworth's endeavor to lay the foundations of his art in an independent study of the feelings and faculties of men in real life, unbiassed as far as possible by poetic custom and convention. If this had meant, as many might suppose from the bare statement of the idea, that the new poet was to turn his back on his predecessors and never look behind him to what they had done, was to reject absolutely as valueless for him the accumulating tradition of thought and expression, was to write in short as if nobody before him had ever written a line, even going to common speech for his diction, a more foolish and unfruitful, silly and presumptuous, ambition could not be conceived. But Wordsworth was guilty of no such extravagance. He was from boyhood upwards a diligent student of poetry, and was not insensible of his obligations to the past. His purpose was only to use real life as a touchstone of poetic substance. Imagination operates in all men for the increase or the abatement of emotion. Incidents that have lodged in the memory are not allowed to lie there unchanged; joy is sustained by the instinctive activity of the imagination in assembling kindred ideas round the original incident, and under the instinctive operation of the same faculty pain is relieved by the suggestion of ideas that console and tranquillize. Now the poet, in Wordsworth's conception, is distinctively a man in whom this beneficent energy of imagination, operative as a blind instinct more or less in all men, is stronger than in others, and is voluntarily and rationally exercised for the benefit of all in its proper work of increase and consolation. If the poet is to discharge this mission profitably, he must study how the imagination works in real life, that is to say, "how men associate ideas in a state of excitement." Not every image that the excited mind conjures up in real life is necessarily poetical. Joy may be chilled and pain exaggerated by morbid imaginative activity. It is the business of the poet to select and modify for his special purpose of producing immediate pleasure. "Nor," says the ardent theorist, "let this necessity of producing immediate pleasure be considered as a degradation of the poet's art. It is far otherwise. It is an acknowledgement of the beauty of the universe, an acknowledgment the more sincere because it is not formal but indirect; it is a task light and easy to him who looks at the world in the spirit of love; further, it is a homage paid to the native and naked dignity of man, to the grand elementary principle of pleasure, by which he knows and feels and moves."

All this is elementary enough as Hartleian psychology. The formal recognition of it will not make a man a poet. But there were several respects in which the formal recognition of these elementary principles of poetic evolution powerfully affected Wordsworth's practice. One of these may be indicated, though not fully expressed, by saying that he endeavored always to work out an emotional motive from within. Instead of choosing a striking theme and working at it like a decorative painter, embellishing, enriching, dressing to advantage, standing back from it and studying effects, his plan was to take incidents that had set his own imagination spontaneously to work, and to study and reproduce with artistic judgment the modification of the initial feeling, the emotional motive, within himself. There is room for an endless amount of subtle discussion, which would be out of place here, as to the exact difference between the methods thus broadly stated. It is obvious that they tend to approximate, inasmuch as all poets must work to some extent from within and all to some extent from without. The

[1] So deeply rooted is the misconception that even Mr. Myers, after quoting the Preface itself, and the famous stanza "Perhaps some dungeon hears thee groan," etc., from *The Affliction of Margaret*, comments as follows: "These lines, supposed to be spoken by 'a poor widow at Penrith,' afford a fair illustration of what Wordsworth calls 'the language really spoken by men,' with 'metre superadded.' 'What other distinction from prose,' he asks, 'would we have?' We may answer that we would have what he has actually given us, viz., an appropriate and attractive music, lying both in the rhythm and the actual sound of the words used." But in the theory this is covered by the phrases *metrical arrangement* and *selection of* the real language of men *in a state of vivid sensation, dignified and variegated and alive with metaphors and figures.* Wordsworth was not an adroit expositor in prose, and he did not make his qualifications sufficiently prominent, but the theory of diction taken with those qualifications left him free without inconsistency to use any language that was not contrary to "true taste and feeling." He acknowledged that he might occasionally have substituted "particular for general associations," and that thus language charged with poetic feeling to himself might appear trivial and ridiculous to others, as in *The Idiot Boy* and *Goody Blake*, he even went so far as to withdraw *Alice Fell*, first published in 1807, from several subsequent editions; but he argued that it was dangerous for a poet to make alterations on the simple authority of a few individuals or even classes of men, because if he did not follow his own judgment and feelings his mind would infallibly be debilitated.

mere fact of using words, the medium of communication between man and man, implies a reference, unconscious or deliberate, to the effect produced on others. But undoubtedly in Wordsworth's case the reference to others was of deliberate purpose as much as possible suppressed. Probably from natural stiffness of temper, he could not make it easily, and found the effort, as it must always be when it is an effort and not a happy instinct, embarrassing and chilling. At any rate, if an association, to use his own terminology, gave pleasure to himself, he did not pause long to consider the probable effect on others. If he did reflect upon it when the act of composition was over, he was often able to satisfy himself that, if an association which seemed to him just, reasonable, and humane, was not acceptable to general sentiment, the general sentiment was corrupt. To this, as he himself with his habits of self-criticism was fully aware, was owing much of his strength and much of his unpopularity. By keeping his eye on the object, as spontaneously modified by his own imaginative energy, he was able to give full and undistracted scope to all his powers in poetic coinage of the wealth that his imagination brought. On the other hand, readers whose nature or education was different from his own, were repelled or left cold and indifferent, or obliged to make the sympathetic effort to see with his eyes, which he refused to make in order that he might see with theirs.

> "He is retired as noontide dew
> Or fountain in a noon-day grove,
> And you must love him ere to you
> He will seem worthy of your love."

From this habit of taking the processes of his own mind as the standard of the way in which "men associate ideas in a state of excitement," and language familiar to himself as the standard of the language of "real men," arises a superficial anomaly in Wordsworth's poetry, an apparent contradiction between his practice and his theory. His own imagination, judged by ordinary standards, was easily excited, excited by emotional motives that have little force with ordinary men. Most of his poems start from humbler, slighter, less generally striking themes than those of any other poet of high rank. But his poetry is not correspondingly simple. On the contrary, much of it, much of the best of it—for example, the *Ode to Duty*, and that on the *Intimations of Immortality*—is as intricate, elaborate, and abstruse, as remote from the ordinary paths of thought, as is to be found in literature. The emotional motive is simple; the passion has almost always a simple origin, and often is of no great intensity; but the imaginative structure is generally elaborate, and, when the poet is at his best, supremely splendid and gorgeous. No poet has built such magnificent palaces of rare material for the ordinary everyday homely human affections. It is because he has invested our ordinary everyday principles of conduct, which are so apt to become threadbare, with such imperishable robes of finest texture and richest design that Wordsworth holds so high a place among the great moralists, the greatest of moralists in verse. And yet he attained this end in his most effectively moral poems, though not by any means in all his poems, without in the least confusing the boundaries between poetry and preaching, his conception of the end of poetry as immediate pleasure serving him as a loadstar.

His practice was influenced also, and not always for good, by his theory that poetry "takes its origin from emotion recollected in tranquillity." This was a somewhat doubtful corollary from his general theory of poetic evolution. A poem is complete in itself; there must be no sting in it to disturb the reader's content with the whole; through whatever agitations it progresses, to whatever elevations it soars, to this end it must come, otherwise it is imperfect as a poem. Now the imagination in ordinary men, though the process is not expressed in verse, and the poet's special art has thus no share in producing the effect, reaches the poetic end when it has so transfigured a disturbing experience, whether of joy or grief, that this rests tranquilly in the memory, can be recalled without disquietude, and dwelt upon with some mode and degree of pleasure, more or less keen, more or less pure or mixed with pain. True to his idea of imitating real life, Wordsworth made it a rule for himself not to write on any theme till his imagination had operated upon it for some time involuntarily; it was not in his view ripe for poetic treatment till this transforming agency had subdued the original emotion to a state of tranquillity.[1] Out of this tranquillity arises the favorable moment for poetic composition, some day when, as he contemplates the subject, the tranquillity disappears, an emotion kindred to the original emotion is reinstated, and the poet retraces and supplements with all his art the previous involuntary and perhaps unconscious imaginative chemistry.

When we study the moments that Wordsworth found favorable for successful composition, a very curious law reveals itself, somewhat at variance with the common conception of him as a poet who derived all his strength from solitary communion with nature. We find that the recluse's best poems were written under the excitement of some break in the monotony of his quiet life—change of scene, change of companionship, change of occupation. The law holds from the beginning to the end of his poetic career. We have already noticed the immense stimulus given to his powers by his first contact with Coleridge after two years of solitary and abortive effort. *Above Tintern Abbey* was composed during a four days' ramble with his sister; he began it on leaving Tintern, and concluded it as he was entering Bristol. His residence amidst strange scenes and "unknown men" at Goslar was particularly fruitful; *She Dwelt among the Untrodden Ways*, *Ruth*, *Nutting*, *There was a Boy*, *Wisdom and Spirit of the Universe*, all belong to those few months of unfamiliar environment. The breeze that met him as he issued from the city gates on his homeward journey brought him the first thought of *The Prelude*. The second year of his residence at Grasmere was unproductive; he was "hard at work" then on *The Excursion;* but the excitement of his tour on the continent in the autumn of 1802, combined perhaps with a happy change in his pecuniary circumstances and the near prospect of marriage, roused him to one of his happiest fits of activity. His first great sonnet, the *Lines on Westminster Bridge*, was composed on the roof of the Dover coach; the first of the splendid series "dedicated to national independence and liberty," the most generally impressive and universally intelligible of his poems, *Fair Star of Evening*, *Once did she Hold the Gorgeous East in Fee*, *Toussaint*, *Milton*, *thou shouldst be Living at this Hour*, *It is not to be Thought of that the Flood*, *When I have Borne in Memory what has Tamed*, were all written in the course of the tour, or in London in the month after his return. A tour in Scotland in the following year, 1803, yielded the *Highland Girl* and *The Solitary Reaper*. Soon after his return he resumed *The Prelude;* and *The Affliction of Margaret* and the *Ode to Duty*, his greatest poems in two different veins, were coincident with the exaltation of spirit due to the triumphant and successful prosecution of the long-delayed work. The *Character of the Happy Warrior*, which he described to Miss Martineau as "a chain of extremely *valooable* thoughts," though it did not fulfil "poetic conditions,"[2] was the product of a calmer

[1] *The Prelude* contains a record of his practice, after the opening lines of the first book—

> "Thus far, O friend! did I, not used to make
> A present joy the matter of a song,
> Pour forth, etc."

[2] This casual estimate of his own work is not merely amusing but also instructive, as showing—what is sometimes denied—that Wordsworth himself knew well enough the difference between "poetry" and such "valuable thoughts" as he propounded in *The Excursion*.

period. The excitement of preparing for publication always had a rousing effect upon him; the preparation for the edition of 1807 resulted in the completion of the ode on the *Intimations of Immortality*, the sonnets *The World is too much with us*, *Methought I saw the Footsteps of a Throne*, *Two Voices are there*, and *Lady, the Songs of Spring were in the Grove*, and the *Song at the Feast of Brougham Castle*. After 1807 there is a marked falling off in the quality, though not in quantity, of Wordsworth's poetic work. It is significant of the comparatively sober and laborious spirit in which he wrote *The Excursion* that its progress was accompanied by none of those casual sallies of exulting and exuberant power that marked the period of the happier *Prelude*. The completion of *The Excursion* was signalized by the production of *Laodamia*. The chorus of adverse criticism with which it was received inspired him in the noble sonnet to Haydon—*High is our Calling, Friend*. He rarely or never again touched the same lofty height.

It is interesting to compare with what he actually accomplished the plan of life-work with which Wordsworth settled at Grasmere in the last month of the eighteenth century.[1] The plan was definitely conceived as he left the German town of Goslar in the spring of 1799. Tired of the wandering unsettled life that he had led hitherto, dissatisfied also with the fragmentary occasional and disconnected character of his lyrical poems, he longed for a permanent home among his native hills, where he might, as one called and consecrated to the task, devote his powers continuously to the composition of a great philosophical poem on "Man, Nature, and Society." The poem was to be called *The Recluse*, "as having for its principal subject the sensations and opinions of a poet living in retirement." He communicated the design to Coleridge, who gave him enthusiastic encouragement to proceed. In the first transport of the conception he felt as if he needed only solitude and leisure for the continuous execution of it. But, though he had still before him fifty years of peaceful life amidst his beloved scenery, the work in the projected form at least was destined to remain incomplete. Doubts and misgivings soon arose, and favorable moments of felt inspiration delayed their coming. To sustain him in his resolution he thought of writing as an introduction, or, as he put it, an antechapel to the church which he proposed to build, a history of his own mind up to the time when he recognized the great mission of his life. One of the many laughs at his expense by unsympathetic critics has been directed against his saying that he wrote this *Prelude* of fourteen books about himself out of diffidence. But in truth the original motive was none other than distrust of his own powers. He began this review of his early life to reassure himself from misgivings whether nature and education had fitted him for his proposed task, partly by elevating his mind to a confidence in nature's special destination, and partly by making practical trial of his powers in a simpler work. He turned aside from *The Prelude* to prepare the second volume of the *Lyrical Ballads* and write the explanatory Preface, which as a statement of his aims in poetry had partly the same purpose of strengthening his self-confidence. From his sister's *Journal* we learn that in the winter of 1801–2 he was "hard at work on *The Pedlar*"—the original title of *The Excursion*. But this experiment on the larger work was also soon abandoned. It appears from a letter to his friend Sir George Beaumont that his health was far from robust, and in particular that he could not write without intolerable physical uneasiness. We should probably not be wrong in connecting his physical weakness with his rule of waiting for favorable moments. His next start with *The Prelude*, in the spring of 1804, was more prosperous; he dropped it for several months, but, resuming again in the spring of 1805, he completed it in the summer of that year. But still the composition of the great work to which it was intended to be a portico proceeded by fits and starts. It was not till 1814 that the second of the three divisions of *The Recluse*, ultimately named *The Excursion*, was ready for publication; and he went no further in the execution of his great design. It is possible that he had his own unfinished project in mind when he wrote the sonnet on Malham Cove—

> "'Mid the wreck of Is and Was,
> Things incomplete and purposes betrayed
> Make sadder transits o'er thought's optic glass
> Than noblest objects utterly decayed."

We shall speak presently of the reception of *The Excursion*. Meantime we must look elsewhere for the virtual accomplishment of the great design of *The Recluse*. The purpose was not after all betrayed; it was really fulfilled, though not in the form intended, in his various occasional poems. In relation to the edifice that he aspired to construct, he likened these poems to little cells, oratories, and sepulchral recesses; they are really the completed work, much more firmly united by their common purpose than by any formal and visible nexus of words. Formally disconnected, they really, as we read and feel them, range themselves to spiritual music as the component parts of a great poetic temple, finding a rendezvous amidst the scenery of the district where the poet had his local habitation. The Lake District, as transfigured by Wordsworth's imagination, is the fulfilment of his ambition after an enduring memorial. The *Poems* collected and published in 1807 compose in effect "a philosophical poem on man, nature, and society," the title of which might fitly have been *The Recluse*, "as having for its principal subject the sensations and opinions of a poet living in retirement." As a realization of the idea of *The Recluse*, these poems are from every poetical point of view infinitely superior to the kind of thing that he projected and failed to complete.

The derisive fury with which *The Excursion* was assailed upon its first appearance has long been a stock example of critical blindness, conceit, and malignity. And yet, if we look at the position claimed for the *Excursion* now by competent authorities, the error of the first critics is seen to lie not in their indictment of faults, but in the prominence they gave to the faults and their generally disrespectful tone towards a poet of Wordsworth's greatness. Jeffrey's petulant "This will never do," uttered, professedly at least, more in sorrow than in anger, because the poet would persist in spite of all friendly council in misapplying his powers,[2] has become a byword of ridiculous critical cocksureness. But the curious thing is that *The Excursion* has not "done," and that the Wordsworthians who laugh at Jeffrey are in the habit of repeating the substance of his criticism, though in more temperate and becoming language. Thus Dean Church, in a criticism at once sympathetic and judicious, after the usual fling at Jeffrey's "insolence," goes on to say—

[1] Wordsworth's residences in the Lake District were Townend, Grasmere, from December, 1799, till the spring of 1808; Allan Bank, from 1808 to 1811; the parsonage at Grasmere, from 1811 to 1813; Rydal Mount, for the rest of his life.

[2] The lively lawyer to whom reviewing was a recreation, obviously enjoyed the process of "slating" more than is quite consistent with his strong protestations of sorrow over the poet's waywardness; but it should not be overlooked that he did make ample acknowledgment, when he had sated himself with denunciations of the Wanderer's verbosity, of the power and beauty of isolated passages. In the second part of his article, indeed, he quoted so much that was admirable that he confessed himself disposed to rescind his severe judgment, but re-perusal of the Wanderer's arguments convinced him that it could not be rescinded. Jeffrey's criticisms in their entirety are dead and buried, except for the professional student, but even critics have their humble rights, and it is time that his four opening words should receive the privilege of interment also, if they are not to be fairly interpreted. His criticism of *The White Doe* is valueless enough, because the sentiment of that poem is more abstruse, less palpable to the running reader; but what he said of *The Excursion* has simply been repeated in duller language by the Wordsworthians who have denounced his arrogance in daring to say it.

"In *The Excursion* and *The Prelude* there are passages as magnificent as perhaps poet ever wrote; but they are not specimens of the context in which they are embedded, and which in spite of them does not carry along with it the reader's honest enjoyment. We read on because we must."[1]

This is the very substance of Jeffrey's criticism, which was far from being unreservedly damnatory, as the following will show:

"Besides those more extended passages of interest or beauty which we have quoted and omitted to quote, there are scattered up and down the book, and in the midst of its most repulsive portions, a very great number of single lines and images that sparkle like gems in the desert and startle us by an intimation of the great poetic powers that lie buried in the rubbish that has been heaped around them."

Jeffrey, it will be seen, was not blind to the occasional felicities and unforgetable lines celebrated by Coleridge, and his general judgment on *The Excursion* has been abundantly ratified.[2] It is not upon *The Excursion* that Wordsworth's reputation as a poet can ever rest, whatever defence may be made for it as "a chain of extremely valuable thoughts," varied by passages of lofty or quietly beautiful description, invigorating exhortation, and gentle pathos. The two "books" entitled *The Churchyard among the Mountains* are the only parts of the poem that derive much force from the scenic setting; if they had been published separately, they would probably have obtained at once a reception very different from that given to *The Excursion* as a whole. The dramatic setting is merely dead weight, not because the chief speaker is a peddler—Wordsworth fairly justifies this selection—but because the peddler, as a personality to be known, and loved, and respected, and listened to with interest, is not completely created. We know Uncle Toby better than Sterne, but we do not know the Wanderer so well as Wordsworth, and consequently we are more easily bored by him than by the poet speaking in his own person as he does in *The Prelude*. His cheerfulness after reciting the tale of Margaret at the ruined cottage is almost offensive; the assigned motive for it in the beauty of nature that remains though the poor broken-hearted woman is gone is hardly higher than the dropsical scullion's philosophy in *Tristram Shandy*. "'He is dead. He is certainly dead,' said Obadiah. 'So am not I,' said the foolish scullion."[3]

There can be little doubt that adverse criticism had a depressing influence on Wordsworth's poetical powers, notwithstanding his nobly expressed defiance of it and his determination to hold on in his own path undisturbed. Its effect in retarding the sale of his poems and thus depriving him of the legitimate fruits of his industry was a favorite topic with him in his later years;[4] but the absence of general appreciation, and the ridicule of what he considered his best and most distinctive work, contributed in all probability to a still more unfortunate result—the premature depression and deadening of his powers. He schooled himself to stoical endurance, but he was not superhuman, and in the absence of sympathy not only was any possibility of development checked but he ceased to write with the spontaneity and rapture of his earlier verse. The common theory that the marked stiffening of his powers after 1807 was the effect of age only may be true; but the coincidence of this falling off with the failure of the strenuous effort made in that year to conquer the hostility of critics and the indifference of the public makes the theory extremely doubtful as a whole truth. Wordsworth's true nature is often misjudged under the fallacy that the preacher of high and serene fortitude in the face of failure and misfortune must himself be imperturbable. On the contrary the most eloquent advocate of this heroic virtue is the man who most feels the need of it in the frailty of his own temper. It is on record that Wordsworth, with all his philosophy of consolation, did not easily recover serenity after domestic bereavements, and we go very far wrong when we confound his proud and self-reliant defiance of criticism with insensibility to it or power to rise at will above its disheartening and benumbing influence.

For five years after the condemnation of *The Excursion* Wordsworth published almost nothing that had not been composed before. The chief exception is the *Thanksgiving Ode* of 1816. He was occupied mainly in the task of putting his work and his aims more fully before the world, maintaining his position with dignity and unflinching courage, so far unmoved by criticism that he would not alter his course one jot for the sake of public favor. In 1815 he published a new edition of his poems, in the arrrangement according to faculties and feelings in which they have since stood; and he sought to explain his purposes more completely than before in an essay on "Poetry as a Study." In the same year he was persuaded to publish the *The White Doe of Rylstone*, written mainly eight years before. In purely poetic charm the *White Doe* ought to be ranked among the most perfect of Wordsworth's poems, the most completely successful exhibition of his finest qualities; nowhere is the peculiar music of his verse more happily sustained or more perfectly in harmony with the noble and tender feeling which here springs as if from infinite depths, to flow round and subdue the tragic agony of the incidents. But Jeffrey, who was much too busy a man to enter into a vein of poetry so remote from common romantic sentiment, would have none of the *White Doe;* he pronounced it "the very worst poem ever written," and the public too readily endorsed his judgment. Two other poems, with which Wordsworth made another appeal, were not more successful. *Peter Bell*, written in 1798, was published in 1819; and at the instigation of Charles Lamb it was followed by *The Wagoner*, written in 1805. Both were mercilessly ridiculed and parodied. These tales from humble life are written in Wordsworth's most unconventional style, and with them emphatically "not to sympathize is not to understand," but when they are read sympathetically they are felt to be written with the spontaneity and freedom of the poet's most inspired moments, although they are not in his high serious vein.

Meantime, the great design of *The Recluse* languished. The neglect of what Wordsworth himself conceived to be his best and most characteristic work was not encouraging; and there was another reason why the philosophical poem on man, nature, and society did not make progress. Again and again in his poetry Wordsworth celebrates the value of constraint and the disadvantage of "too much liberty," of "unchartered freedom."[5] This thought was im-

[1] Ward's *English Poets*, vol. iv. p. 13. Mr. Myers and Mrs. Oliphant might be quoted to the same effect.

[2] In joining *The Prelude* with *The Excursion* in the same condemnation, Dean Church goes farther than Jeffrey. As a poem *The Prelude* is infinitely superior; its autobiographical character gives it a certain unity, and it contains a greater number of lofty passages in Wordsworth's best vein.

[3] Charles Lamb's review of *The Excursion* in the *Quarterly* (Oct., 1814), in spite of the editor Gifford's modifications, remains the most sympathetic of competent criticisms of the poem. In one point there is an oversight, significant of the indefiniteness of Wordsworth's exposition; Lamb supposes the conversion of the Solitary to be accomplished within *The Excursion*. It was really reserved for the third part of *The Recluse*. It was the poet's intention, as expressed in his conversations with Miss Fenwick, to effect this conversion not by argument, but by carrying the skeptic back to his native Scotland, making him witness of a sacrament service, and making early associations thereupon reassert themselves. This would have been in accordance with his theory of the value of early associations. What makes the position of the Solitary a little difficult to grasp at first is that Wordsworth, on principle, does not present this character in marked contrast to the other characters in the poem, but rather lays stress on what he has in common with them, tender-heartedness towards suffering and intense enthusiasm for nature; hence it arises that the reader cannot see without some study what it is that the other interlocutors find lacking in him, and aim at supplying to him.

[4] Mr. Matthew Arnold heard him say that "for he knew not how many years his poetry had never brought him in enough to buy his shoe-strings" (preface to *Selection*, p. v.). The literal facts are that he received £100 [$486] from the Longmans in 1800, and nothing more till he was sixty-five, when Moxon bought the copyright of his writings for £1000 [$4860] (*Prose Works*, iii. 437).

[5] See the Sonnet, *Nuns fret not*, etc., *The Pass of Kirkstone*, and the *Ode to Duty*.

pressed upon him by his own experience. There was "too much liberty" in his vague scheme of a philosophical poem. He needed more of the constraint of a definite form to stimulate his working powers to prosperous vigor. The formlessness of the scheme prevented his working at it continuously. Hence his "philosophy" was expressed in casual disconnected sonnets, or in sonnets and other short poems connected by the simplest of all links, sequence in time or place. He stumbled upon three or four such serial ideas in the latter part of his life, and thus found beginning and end for chains of considerable length, which may be regarded as fragments of the project which he had not sufficient energy of constructive power to execute. The *Sonnets on the River Duddon*, written in 1820, follow the river from its source to the sea, and form a partial embodiment of his philosophy of nature. The *Ecclesiastical Sonnets*, written in 1820–21, trace the history of the church from the Druids onwards, following one of the great streams of human affairs, and exhibit part of his philosophy of society. A tour on the Continent in 1820, a tour in Scotland in 1831, a tour on the west coast in 1833, a tour in Italy in 1837, furnished him with other serial forms, serving to connect miscellaneous reflections on man, nature, and society; and his views on the punishment of death were strung together in still another series in 1840. He sought relief from "the weight of too much liberty" in this voluntary subjection to serial form, taking upon himself that

> "Constraint
> Whence oft invigorating transports flow
> That choice lacked courage to bestow."

His resolute industry was productive of many wise, impressive, and charitable reflections, and many casual felicities of diction, but the poet very seldom reached the highest level of his earlier inspirations.

Wordsworth was appointed poet-laureate on the death of Southey in 1843. His only official composition was an ode on the installation of the Prince Consort as chancellor of Cambridge university in 1847. This was his last writing in verse. He died at Rydal Mount after a short illness, on the 23d of April, 1850, and was buried in Grasmere churchyard.

It was Wordsworth's own desire that there should be no elaborate criticism of his poetry. This desire has not been respected. We have already referred to Lamb's severely edited review of *The Excursion* (1814), and to Coleridge's criticism in the *Biographia Literaria* (1817). This last, together with the enthusiastic and unreserved championship of Wilson in *Blackwood's Magazine* in a series of articles between 1819 and 1822 (see *Recreations of Christopher North*), formed the turning point in Wordsworth's reputation. From 1820 to 1830 De Quincey says it was militant, from 1830 to 1840 triumphant. By 1850 there were signs of reaction, but, though the language of criticism has become more judicial, there has been no falling off in veneration for Wordsworth's character or appreciation of his best work. Among critics that are specially interesting for various reasons we may mention De Quincey (*Works*, vols. ii. and v.), Sir Henry Taylor (*Works*, vol. v.), George Brimley (*Essays*), Matthew Arnold (preface to *Selection*), Mr. Swinburne (*Miscellanies*), Mr. F. W. H. Myers ("Men of Letters" series), and Mr. Leslie Stephen (*Hours in a Library*, 3d series, "Wordsworth's Ethics").

Wordsworth's writings in prose have been collected by Mr. Grosart (London, 1876). This collection contains the previously unpublished *Apology for a French Revolution*, written in 1793, besides the scarce tract on the *Convention of Cintra* (1809) and the political addresses *To the Freeholders of Westmoreland* (1818). The bulk of three volumes is made up by including letters, notes, prefaces, etc. Wordsworth's *Guide to the Lakes* originally appeared in 1810 as an introduction to Wilkinson's *Select Views*, and was first published separately in 1822.

The standard editions of Wordsworth are Moxon's six-volume edition, originally settled by the poet himself in 1836–7, and Moxon's single-volume double-column edition sanctioned by the poet in 1845. A carefully annotated edition in nine large volumes, by Prof. Knight, is in course of publication. It contains a useful chronological table of the poems; and the hitherto unpublished part of *The Recluse* is promised for the ninth volume. Prof. Knight's book on *The English Lake District* is also useful to minute students of Wordsworth. (W. M.)

WORKINGTON, a seaport and market-town of Cumberland, England, on the south bank of the Derwent, where it enters the Solway Firth, and on several branch railway lines, 34 miles southwest of Carlisle and 311 miles from London by rail. The Derwent is crossed by a stone bridge of three arches, erected in 1841. In the more ancient portions of the town the streets are narrow and irregular, but there are now many spacious streets with handsome houses and shops. The ancient parish church of St. Michael was rebuilt in 1770, and, this building having been destroyed by fire in 1887, another is now (1888) in course of erection. The other public buildings are the jubilee hall, the assembly rooms, the temperance hall, the mechanics' institute, the infirmary, the new covered market, the custom-house, and the bonded warehouses. Near the town is Workington Hall, the seat of the ancient lords of the manor, a quadrilateral castellated structure in great part modern, but still retaining some of the ancient rooms, including that in which Mary queen of Scots is said to have slept when she escaped to England after the battle of Langside in May, 1568. The harbor is remarkably safe, and has been improved by the construction of a breakwater 600 feet in length. The Lonsdale dock, 4½ acres in extent, was opened in 1862. In 1886 37 vessels in the foreign and colonial trade (19,806 tons) entered the port, and 24 cleared (10,495 tons); 1687 in the coasting trade entered (197,487 tons), and 1682 cleared (206,404 tons). The value of the exports of the produce of the United Kingdom in 1882 was £181,012 [$879,718.32], but in 1885 it was only £13,845 [$67,286.70], and in 1886 it was £38,468 [$186,954.48]. The chief exports are pig-iron, lime, coal, steel rails, and steel plates. The value of the imports of foreign and colonial merchandize in 1882 was £57,512 [$279,508.32], but since then it has declined, and was only £18,282 [$88,850.52] in 1885, and £27,448 [$133,397.28] in 1886. A considerable proportion of the imports are, however, from the ports of the United Kingdom, the principal items being iron-ore and moulding-sand. In the neighborhood there are large collieries, but the chief industry is the manufacture of iron and steel by the Bessemer and Siemens process. There are large blast-furnaces, engineering works, and bolt and rivet and tinplate works. Iron shipbuilding is also carried on: 2 vessels were built in 1886, of 3986 tons. The population of the urban sanitary district (area 641 acres) in 1871 was 7979, which by 1881 had increased to 13,308. In 1882 the area was extended to embrace 3463 acres, the population of that area in 1871 being 8413, which by 1881 had increased to 14,371. The town is about to be incorporated (1888).

WORKSOP, a market-town of Nottinghamshire, England, is situated on the Chesterfield Canal, and on the Manchester, Sheffield, and Lincoln Railway and the Midland Railway, 16 miles east-southeast of Sheffield and 146½ from London. It is a well-built and pleasant country town, with considerable traces of antiquity. The church of St. Mary and St. Cuthbert is an old priory church, once divided internally into two buildings, the eastern dedicated to St. Mary being for the use of the canons, and the western dedicated to St. Cuthbert for the parishioners. When the priory was demolished at the Reformation only the western portion of the church was spared, and for many years it was in a dilapidated condition until it was restored with Perpendicular additions. Behind it are the ruins of the lady chapel, containing some fine Early English work. The priory gatehouse, chiefly in the Decorated style, now forms the entrance to the precincts of the church. It is supposed to have been built early in the 14th century by the third Lord Furnival, when the market was established. Of the priory itself the only remains are a wall at the northwest corner of the church which includes the cloister gateway. There

was a Norman keep on the castle hill, but no remains of the building are now left. The magnificent manor-house, built by Gilbert, first earl of Shrewsbury, and occasionally occupied by Mary queen of Scots during her captivity under the sixth earl, was in great part destroyed by fire in 1761, while being restored at great expense by the duke of Norfolk, and when the estate came into the possession of the duke of Newcastle in 1840 the ruined portion of the mansion remaining was removed and a smaller mansion built near it. The ecclesiastical parish of St. John's was formed in 1867. There is a corn exchange, erected in 1854, in the Venetian style, and a mechanics' institute, erected in 1852. Formerly liquorice was extensively grown, but malting is now the principal industry. A large corn market and a cattle and horse fair are held. The town also possesses brass and iron foundries, agricultural implement works, saw-mills, and chemical works. The population of the urban sanitary district (18,220 acres) was 10,409 in 1871, and 11,625 in 1881.

Worksop occurs in Domesday as Withercope. By William the Couqueror the manor was bestowed on Roger de Busli. It subsequently passed to William de Lovitot, who in 1103 founded a priory for Augustinian canous dedicated to St. Mary. From the De Lovitots it passed successively to the Furnivals, the Nevilles, the Talbots, earls of Shrewsbury, and the Howards, earls of Arundel aud afterwards dukes of Norfolk. By the duke of Norfolk it was sold in 1840 to the duke of Newcastle, whose country mansion, Clumber, is in the parish. In December, 1460, an engagement took place at Worksop between the forces of the duke of York and those of the duke of Somerset.

See White's *Worksop*, 1875; and Sissons, *Guide to Worksop*, 1888.

WORM. This word has no definite significance in modern zoological classification; it is constantly applied to several phyla of the animal kingdom which have for the most part no special relations to each other. By Linnæus the Latin equivalent "Vermes" was applied to the modern divisions of MOLLUSCA, CŒLENTERA, PROTOZOA, TUNICATA, ECHINODERMATA (*qq.v.*), as well as to those animals which are in

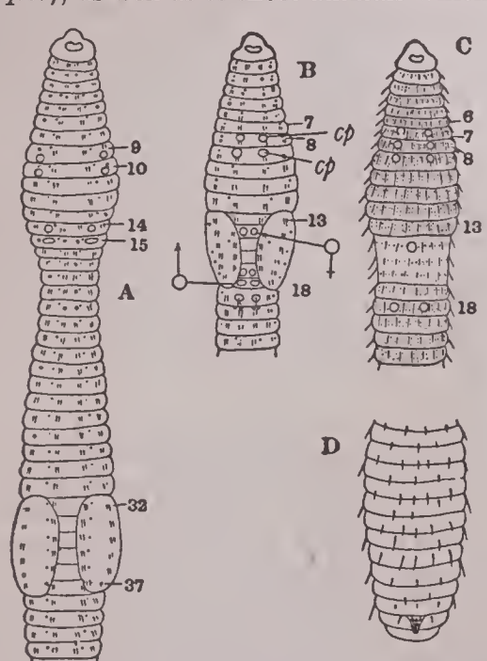


FIG. 1.—Diagrams of various Earthworms, to illustrate external characters. A, B, C, anterior segments from the ventral surface; D, hinder end of body of *Urochæta*. A. *Lumbricus:* 9, 10, segments containing spermathecæ, the orifices of which are indicated; 14, segment bearing oviducal pores; 15, segment bearing male pores; 32, 37, first and last segments of clitellum. B, *Acanthodrilus; cp*, orifices of spermathecæ; ♀, oviducal pores; ♂; male pores; on 17th and 19th segments are the apertures of the atria. C, *Perichæta:* the spermathecal pores are between segments 6 and 7, 7 and 8, 8 and 9, the oviducal pores upon the 14th and the male pores upon the 18th segment. In all the figures the nephridial pores are indicated by dots and the setæ by strokes.

many current text-books of zoology grouped together under the same name.[1] The group *Vermes* as used, for example, by Claus includes several distinct phyla, viz., NEMATOIDEA (*q.v.*), *Platyhelminthes* (see PLANARIANS, TAPE-WORMS, and TREMATODA), NEMERTINES (*q.v.*), *Chætognatha* (see SAGITTA), *Gephyrea* (see ANNELIDA), ROTIFERA (*q.v.*), *Discophora* (see LEECH), *Chætopoda*.

The *Chætopoda* are divided into *Oligochæta* and *Polychæta*, which have been shortly treated of, together with *Discophora* and *Gephyrea*, in the article ANNELIDA (*q.v.*). The leech and its kindred (*Discophora*) have been more fully described in another article (LEECH, *q.v.*). The present article will treat of the earthworm and its immediate allies. The earthworm belongs to the order *Oligochæta*, which also includes a number of freshwater forms; these latter *Oligochæta* have been distinguished as "*Limicolæ*" from the earthworms or "*Terricolæ*." There are, however, no structural peculiarities of any importance which absolutely distinguish the terrestrial from the aquatic forms. Earthworms are, it is true, characterized by the simplicity of their setæ, by the absence of cilia upon the body, by the thickness of the body-wall, which implies an increased thickness of the muscular layers, and by the thickness of the intersegmental septa, particularly in the anterior region of the body. All these structural modifications, however, are so obviously connected with the density of the medium in which they live that they cannot be held to be of primary importance. On the other hand, there is no deep-seated anatomical character which distinguishes earthworms from the freshwater *Oligochæta*. An article on earthworms must therefore necessarily include an account of the aquatic and mud-inhabiting *Oligochæta*.

The *Oligochæta* range in size from a few lines to several feet in length; the large earthworm from the Cape Colony (*Microchæta rappi*) measures 5 or 6 feet in length when fully extended. On the whole the terrestrial forms (earthworms) are larger than the aquatic forms. The *Oligochæta* are found all over the globe, but at present no details of value can be given as to their distributional areas.[2] As might be imagined from their soft perishable bodies, nothing is known respecting the distribution of the *Oligochæta* in past time.

The most prominent characteristic of the *Oligochæta*, as of the *Chætopoda* generally, is the segmentation of the body: the body is divided into a series of segments or metameres, which resemble each other most closely in the lowest forms. This metamerism is seen externally in the presence of transverse furrows, corresponding with the internal divisions of the body cavity, and in the disposition of the setæ. The mouth opens into the first segment, which is usually unprovided with setæ; in front of the mouth is a preoral lobe; this latter is aborted in some *Oligochæta* (*Urochæta, Thamnodrilus*).

Body-Wall.—In all *Oligochæta* three layers can be distinguished in the body-wall—(1) an outer epidermis, which secretes a delicate cuticle, (2) a circular muscle layer, (3) a longitudinal muscle layer. Within the last-named is the peritoneal lining of the cœlom. Body-wall.

Clitellum.—During sexual maturity certain of the segments of the body in *Lumbricus* and other earthworms undergo a change in appearance which is caused by the development of several layers of unicellular glands beneath the epidermis. Among the "*Limicolæ*" (*e.g., Limnodrilus, Rhynchelmis, Enchytræidæ*) the clitellum is, on the contrary, furnished with an epidermal layer only one cell thick; some of these cells become large and glandular. In these points *Criodrilus* agrees with earthworms. The secre-

[1] Gegenbaur, *Elements of Comp. Anat.*, Eng. trans., 1878; Claus, *Text-Book of Zoology*, Eng. trans., 1884.

[2] The genus *Acanthodrilus* is almost entirely Antarctic in its range. It occurs in Patagonia, S. Georgia, Kerguelen's Land, New Zealand, Cape of Good Hope and other parts of Africa, Madagascar, and New Caledonia. *Perichæta* is characteristic of the Old and New World tropics, particularly of the former; in the Old World it ranges from India to China and Japan, and through the Indian Islands to Australia and New Zealand. Australia has the peculiar genera *Megascolides, Notoscolex*, and *Cryptodrilus*, but the greatest number of peculiar genera are found in the Neotropical region. In Europe the most characteristic genera are *Lumbricus* and *Allolobophora;* these are found in most other parts of the world, but it is possible that they have been accidentally imported.

tion of these glands may form the cocoon in which the eggs are deposited, but it appears to be also used to attach individuals together during copulation. The clitellum is universal among the *Oligochæta*. *Moniligaster* and *Criodrilus* were for some time considered as an exception to this rule, but a clitellum has recently been demonstrated in these two genera by Bourne (17)[1] and Benham (7). The clitellum in earthworms never occupies less than two segments, and in *Trigaster* it extends over twenty-seven.

Setæ.—These are universally found in the *Oligochæta*, but differ in their shape, as well as in their number and arrangement, in different families. In the majority of forms the setæ are disposed in four longitudinal rows; the setæ in each of these rows may be comparatively numerous (*Naidomorpha*), or may be limited to two *Lumbriculidæ* and many

FIG. 2.—Setæ of *Oligochæta*. *a*, penial seta of *Perichæta ceylonica*; *b*, extremity of penial seta of *Acanthodrilus* (after Horst); *c*, seta of *Urochæta* (Perier); *d*, seta of *Lumbricus*; *e*, seta of *Criodrilus*; *f*, *g*, setæ of *Bohemilla comata*; *h*, *i*, *j*, setæ of *Psammoryctes barbatus* (*f* to *j* after Vejdovsky).

earthworms. In *Acanthodrilus multiporus* and other earthworms the eight setæ are no longer in pairs, but separated by nearly equivalent intervals. In *Urochæta* (Fig. 1, D) and *Diachæta* each segment has also eight setæ, but these are disposed more or less alternately in successive segments. In the former of these two genera, as also in *Eudrilus*, peculiar structures of a chitinous nature exist between the individual setæ of a segment; these are similar to certain structures described in *Anachæta* by Vejdovsky (15) as abortive setæ; their presence in *Urochæta* and *Eudrilus* may indicate that the number of setæ in these worms has been reduced from a continuous circle round each segment, such as exists in the family *Perichætidæ* (Fig. 1, C). Among the *Naidomorpha* there are delicate hair-like setæ which pass by numerous intermediate forms into setæ with a bifurcate extremity; in many limicolous forms, as in earthworms, the setæ are simple in form, ending in a slightly curved extremity. The setæ are developed in the interior of cells of ectodermic origin; special muscles effect their movements.

Cœlom.—The *Oligochæta*, like other Annelids, have a cœlom which is formed by the excavation of paired mesoblastic somites; the intersegmental septa represent the walls of each two adjacent somites; the dorsal and ventral mesenteries, which in the *Archiannelida* suspend the gut from the body-wall, are largely absent in the *Oligochæta*, the cavities of each pair of somites becoming continuous. Traces of the dorsal mesentery are met with in some forms; in almost all the ventral mesentery persists to a great extent in a sheet which suspends the ventral bloodvessel from the intestine.

Cœlom.

The cœlom communicates with the exterior by the nephridia and ducts of the reproductive organs and by certain dorsally-placed pores. These latter are sometimes present only on the head segment (*Criodrilus* and many aquatic genera), sometimes on the body segments also (*Enchytræida*); in the majority of earthworms they appear to exist only on the body segments, and the first one does not usually appear before the third and fourth segment. In *Pontodrilus* and a few other species the dorsal pores are entirely absent. The cœlom is lined with a peritoneum, the cells of which exhibit different characters in different parts of the body. The intestine is covered with a layer of large cells containing numerous granules; this cellular investment was originally described as hepatic, but it is now known to have no relation to the alimentary tract. The investigations of Kükenthal (16) show that these cells are concerned with the excretory function.

[1] These figures refer to the "Literature," p. 719.

Nervous System.—This consists of (1) a pair of cerebral ganglia connected by a circumœsophageal ring with a chain of ventral ganglia arranged in pairs—a pair to each segment; (2) a system of small ganglia and nerves arising from the cerebral ganglia and innervating the anterior part of the alimentary tract; and (3) two lateral ganglionated cords, which have a special interest for those who believe that the segmented worms are the Invertebrate group from which the *Chordata* (including the *Vertebrata*) have sprung. The discovery of Eisig ("Die Capitelliden," *Naples Monographs*), that this lateral cord is on both sides connected with segmentally arranged sense-organs in the *Capitellidæ*, is an additional argument for considering this lateral system as the homologue of the lateral line in fishes.

Nervous system.

The nervous system of *Æolosoma* is probably degenerate; it consists merely of a pair of cerebral ganglia, which are situated in the procephalic lobe in connection with the epidermis. In *Ctenodrilus* the nervous system, like that of the *Archiannelida* (see below), is imbedded in the epidermis throughout its whole extent. In the higher forms, in fact in all the remaining *Oligochæta*, the central nervous system has lost its primitive connection with the epidermis. Moreover, in these forms the cerebral ganglia, originally developed in the procephalic lobe, have moved back, and may lie as far back as in the fourth segment.

Vascular System.—All the *Oligochæta* possess, in addition to the corpusculated fluid of the cœlom, a system of closed vessels which in the higher forms attains to a very highly developed condition. This vascular system contains in nearly all the *Oligochæta*, as in the *Polychæta* and *Hirudinea*, a red-colored fluid, which has been proved to owe its coloration to hæmoglobin, and in which are suspended corpuscles. *Æolosoma* has a colorless pseudhæmal fluid. In the lower forms the walls of the bloodvessels are excessively delicate, and contain no muscles; in the higher forms (*e.g.*, *Lumbricus*) the bloodvessels are furnished with muscular tissue as well as with an epithelial lining. The cells of the latter give rise to the corpuscles of the blood, which consist of little more than the nucleus.

Vascular system.

The simplest form of vascular system occurs in *Æolosoma* and *Ctenodrilus*. The alimentary tract is surrounded with a network of blood capillaries, which in the œsophageal region unite to form a dorsal vessel; this passes along the œsophagus, but is situated between the walls of the intestine and its covering of peritoneal cells; beneath the cerebral ganglia the dorsal vessel gives off a branch on either side; these unite with a ventral vessel, which passes beneath the intestine, and gives off branches to it, which are regularly arranged in pairs. In the *Enchytræidæ* the dorsal vessel is also restricted to the anterior segments of the body, and originates from a blood sinus in the walls of the alimentary tract. The dorsal vessel gives off anteriorly two branches which unite to form the ventral vessel; three pairs of slender vessels, a pair to each segment, originate from the dorsal vessel, and are connected with these two branches. In all the higher *Oligochæta* there is reticulum of blood capillaries developed in the walls of the alimentary canal, but the dorsal vessel, although connected with this network, does not originate from it, but passes from end to end of the body. The dorsal vessel is also connected with the ventral vessel by paired trunks, which are segmentally disposed, *i.e.*, a pair to each segment. In the *Naidomorpha* and *Lumbriculidæ*, the vascular system consists only of these parts, together with some few branches which penetrate the layers of the body-wall and reach to the epidermis. Among earthworms the vascular system is more complex; our knowledge of the details of the circulation in certain tropical genera (*Urochæta*, *Pontodrilus*) is due to Perrier, and but little of importance has been added to his descriptions. The circulation of *Lumbricus* is known principally from the investigations of D'Udekem, Claparède, and recently of Horst. In *Lumbricus* there are three longitudinal trunks (Fig. 3) which run from end to end of the body—(1) dorsal, (2) supranervian, (3) subnervian. The dorsal vessel is connected with the supranervian by seven pairs of stout trunks in the outer part of the body; from the dorsal vessel in front of the last of these originates on either side a lateral longitudinal vessel which passes along the sides of the œsophagus and gives off branches to it. In the intestinal region the dorsal vessel is connected by branches with the capillary network of the intestine, and also directly by lateral branches with the subnervian vessel; the latter gives off branches to the body-walls. The majority of earth-

worms possess in addition a small vessel running above the alimentary canal, but below the dorsal vessel; this is especially concerned with the blood supply of the alimentary tract, and in the intestinal region it runs in the interior of the typhlosole; the presence of this supra-intestinal trunk was first noted by Perrier, who also discovered that more or fewer of the large contractile "hearts" of the anterior segments are connected with this vessel as well as with the dorsal vessel. The subnervian vessel is absent in *Pontodrilus* and other genera. The immense development of the integumental capillary system is characteristic of earthworms, and is no doubt to be explained by the much

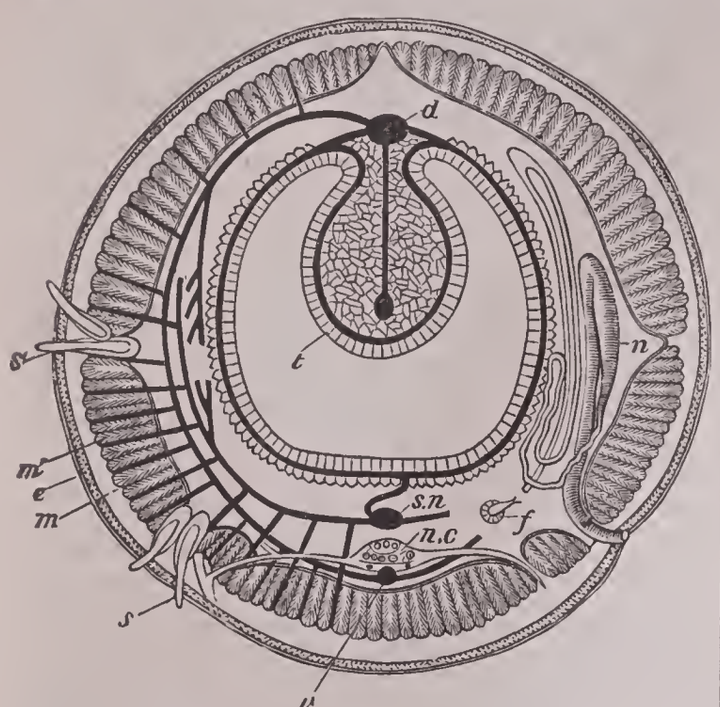

FIG. 3.—Diagrammatic Transverse Section through one of the Posterior Segments of *Lumbricus* (partly after Marshall and Hurst). *n*, nephridium; *f*, funnel of nephridium; *n.c.*, nerve cord; *e*, epidermis; *m*, transverse muscles; *m'*, longitudinal muscles; *s*, *s'*, ventral and dorsal pairs of setæ; *t*, typhlosole; *d*, dorsal blood-vessel, connected by a vertical branch with typhlosole and by branches with intestinal blood-plexus; *s.n*, supranervian vessel; *v*, infranervian vessel. On the left side are indicated the chief vessels given off from the main trunk to the body-wall and nephridium.

greater thickness of the body-wall; it has been already stated that among the lower *Oligochæta* the integumental capillary system is present though feebly developed. In some genera of earthworms the capillaries penetrate the epidermic layer, as in some of the aquatic genera and in many leeches. It has been recently stated by Sarasin that these epidermic capillaries open by pores on to the exterior. That the vascular system of *Æolosoma* represents a primitive condition is shown by the investigations of Vejdovsky (15) into the development of *Rhynchelmis*. In this worm the dorsal vessel is at first only visible in the anterior region of the body, where it lies upon the œsophagus below the peritoneal covering of the latter; posteriorly it communicates with a blood sinus surrounding the intestine; this stage exactly corresponds to the adult *Æolosoma*, and the blood is also colorless; subsequently the dorsal vessel becomes connected with the ventral by a few lateral trunks; this stage is retained in the *Enchytræidæ*. Moreover, in the *Chloræmidæ* a similar condition exists (Horst, *Zool. Anzeig.*, viii. p. 12), and in the larval *Terebella*.

Excretory Organs.—It has been recently shown by Vejdovsky (15) that the *Oligochæta*, like *Polygordius*, many *Polychæta*, *Gephyrea*, and *Hirudinea*, possess temporary larval excretory tubules as well as the definitive nephridia. These organs have been found in *Rhynchelmis*, *Nais*, *Chætogaster*, and *Æolosoma*. In the first mentioned type they appear as a pair of fine tubes with a ciliated lumen, without any apparent internal aperture; they run on either side of the pharynx, and each opens by a pore placed at the side of the mouth. In the young asexually produced individual of *Nais*, *Chætogaster*, and *Æolosoma* similar organs are to be seen. The permanent excretory organs consist in the majority of *Oligochæta* of three parts: (1) a funnel-shaped expansion furnished with cilia, opening into the body cavity; (2) a coiled glandular tube; and (3) a terminal vesicle furnished with muscular layers, and opening on to the exterior of the body. The latter section may be absent, and in the relative proportions of the different parts as well as in certain details of their structure there are great differences. As a general rule, the funnel lies in a segment anterior to that which bears the external pore; but in *Plutellus* Perrier states that the whole organ lies in one segment. In the majority of forms there are not more than a single pair of nephridia to each segment (except in *Perichæta*, etc.). In the limicolous *Oligochæta* nephridia are generally wanting in the anterior segments of the body, and disappear in those which contain the generative ducts when the latter are developed; in the terricolous forms, on the other hand, the nephridia usually commence in the second or third segment. *Ctenodrilus* is remarkable for the fact that it only possesses a single pair of nephridia, the funnel of which is situated on the anterior side of the first dissepiment; but in no form are these organs entirely wanting. The glandular part of the organ consists, as in the *Hirudinea* and most Platyhelminths, of a row of cells placed end to end, which are perforated by the lumen; the lumen of the tubule is therefore, as was first discovered by Claparède, *intra*-cellular; in this particular the nephridia of the *Oligochæta* differ from those of the *Polychæta*, where the walls of the duct are made up of rows of cells, the lumen therefore being *inter*-cellular.[1] While in the greater number of *Oligochæta* the lumen of the tubule is simple and unbranched, in *Chætogaster* fine branches are given off, which ramify in the substance of the cells; this is an important point of resemblance to the nephridia of the *Hirudinea*, where Vejdovsky and Bourne (*Q. J. M. S.*, 1884) have described a similar branching of the duct. The glandular part of the nephridium is often, as in *Lumbricus*, differentiated into two parts; the anterior section is composed of more delicate cells, the posterior of larger and more glandular cells; the lumen is furnished with cilia. The external surface of the organ is frequently covered with rounded cells of a glandular appearance, which are to be looked upon as modified peritoneal cells; in certain cases (*e.g.*, *Pontodrilus* and many "*Limicolæ*") those cells form a solid mass in the interior of which are concealed the windings of the excretory tubule. Special dilatations of the tubule are occasionally met with, as in *Rhynchelmis;* and, among leeches, *Clepsine*, *Pontobdella*, etc., show a similar dilatation, which, as in *Rhynchelmis*, comes immediately after the funnel. The terminal section of the nephridium, the "contractile" vesicle, is more marked among earthworms than in the "*Limicolæ*"; it is lined by a delicate layer of cells and furnished with muscular fibres; in *Urobenus* (Benham, 7), as well as in many other species, this region of the nephridium is very largely developed, and is furnished with a long sac-like diverticulum. The differences in structure between the various parts of the nephridium are due to their different origin: the funnel is formed independently of the glandular tubule, though both take their origin from the mesoblast; the contractile vesicle is invaginated from the ectoderm.

In *Acanthodrilus multiporus* Beddard found that the number of nephridial pores in the anterior region of the body to each segment was more than 100. In *Typhæus* an almost identical arrangement exists, and in *Perichæta* (Beddard, 4). In the last-named genus, as well as in an Australian form, *Megascolides* (Spencer, 12), the nephridial system forms a continuous network of tubules, uninterrupted by the septa. In *Acanthodrilus* the network of each segment is independent. In this genus, as in *Perichæta*, there are numerous ciliated funnels in each segment.

The relation of the nephridia of the *Chætopoda* to those of the Platyhelminths, on the one hand, and to those of the *Hirudinea* and *Gephyrea* are variously interpreted. It has been proved that in *Polygordius*, many *Chætopoda*, and many *Hirudinea* and *Gephyrea*, the larvæ, like those of the *Oligochæta*, possess excretory organs, which are constructed on the type of the nephridia in Platyhelminths. This is at any rate the case with *Polygordius*, the Chætopod larva, and the larva of *Echiurus;* in all these types the nephridia are paired branched tubes, which open separately on to the exterior; they have, however, no internal openings, the flagellate cells of the Platyhelminth, with their single flagellum and funnel-shaped perforation, being absent. The larval excretory organs of the *Hirudinea*, like those of the *Oligochæta* referred to above, are to be looked upon as in a more rudimentary condition; they are unbranched, and are sometimes without an external orifice. Moreover, essentially similar organs are found in the larval mollusc. In many of the above-cited examples it is certain that the larval excretory organs have no connection with the permanent excretory organs; they atrophy before the latter appear. Hatchek, however, has stated that there is a connection between the larval and permanent excretory organs

Excretory organs.

[1] Nussbaum has lately (*Arch. Slav. de Biol.*, i.) found that in the leech a number of cells fuse to form a single drain-pipe cell. This would tend to prove that the intercellular lumen preceded the intracellular.

in *Polygordius;* doubts have been thrown upon this observation by some who believe that the facts already cited showed (1) that the excretory system of *Annelida* and *Hirudinea* is a new formation, while (2) the excretory system of their Platyhelminth ancestors is represented by the transitory excretory system of the *Annelida*, which has therefore naturally no connection with the permanent excretory system. This view has the merit of explaining the presence of apparently similar structures (*i.e.*, the larval nephridia) in such diverse types as *Mollusca*, *Hirudinea*, and *Gephyrea*, and is perhaps further supported by the high development of the larval excretory organ in the active larvæ of *Polygordius*, *Echiurus*, and the *Chætopoda*, and its rudimentary character in the embryo *Oligochæta*. It follows from this that the permanent nephridia of the *Chætopoda* are new structures, unless the views of Bergh (18) be accepted, who would derive these organs from the generative ducts of the Platyhelminths.

Against this hypothesis may be urged (1) the unlikelihood of a new formation of excretory organs in Annelids, and the probability of these organs being really homologous with those of their Platyhelminth ancestors, and (2) the fact that the larval excretory organs of *Polygordius*, *Polychæta*, and *Oligochæta* and *Hirudinea* are connected with the permanent system or at least are not in any way replaced by the permanent excretory system; in the *Oligochæta* the larval excretory organs appear comparatively late, and the segment occupied by them never gives rise to a pair of permanent nephridia.

The following facts lead to another hypothesis, which is in many respects more acceptable.

A connection between the nephridia of consecutive segments has been recently stated by Wilson to occur in the embryo *Lumbricus*. Meyer and Cunningham have observed the same in *Terebella*. Vejdovsky (15) has recorded in *Anachæta bohemica* a connection between the nephridia of the 21st and 22d segments, and moreover the first pair of nephridia has two internal funnels. In the leech *Pontobdella* the nephridia (Bourne, *Q. J. Mic. Sci.*, 1884) form a network, the internal funnels and external apertures alone being arranged metamerically. The presence of numerous external pores to each segment in certain earthworms, and the continuity of nephridia of adjacent segments are facts to be referred to the same category. Eisig's discovery of the presence of many nephridia in each of the segments of the *Capitellidæ*, which are connected together, is also, like the other facts referred to, in harmony with the supposition that the excretory system of the *Annelida* has been directly derived from that of the Platyhelminths somewhat as follows. The excretory system is at first, as in the Platyhelminth, a continuous system, opening by numerous apertures into the body cavity by a single orifice or a pair of orifices on to the exterior. Secondary external apertures are then formed, which are irregular in their disposition (these actually occur in certain Platyhelminths), and more or less numerous; this condition is largely retained in *Acanthodrilus* and *Perichæta;* the secondary external apertures as well as the internal apertures then become reduced in number and metamerically arranged; this condition occurs in *Pontobdella* and *Terebella*, and to a very limited extent in *Anachæta*. The connection between the nephridial system of succession segments then disappears, and the characteristic Annelid excretory system is arrived at.

Alimentary Tract.—The alimentary canal of all the *Oligochæta* is a straight tube running from mouth to anus, but even in the lowest forms is specialized into different regions. A pharynx, œsophagus, and intestine can be recognized universally; the pharynx is formed by the stomodæal invagination of the epiblast, while the terminal section of the intestine is formed by the proctodæal invagination; the rest of the alimentary canal is hypoblastic. In *Æolosoma* the pharynx is restricted to the first segment of the body, a condition which is seen in the embryonic stages of other *Oligochæta*, but also in the adult *Polygordius* (see below). This is followed by the narrow œsophagus, which leads, in the fourth segment, into the intestine; the intestine is at first wide, but afterwards becomes narrower; the whole alimentary canal is ciliated. In the higher types the pharynx occupies several segments, and is preceded by a buccal cavity, the epithelium of which is not ciliated; in many *Oligochæta* (*e.g.*, *Enchytræus*) the pharynx is protrusible. It is frequently furnished with glands, which are of two kinds, and probably not morphologically comparable. In many *Enchytræidæ* and *Naidomorpha* certain of the anterior segments contain glands attached to the anterior faces of the intersegmental septa; these have been termed septal glands. In *Anachæta* there are only two pairs of these glands, but four in *Pachydrilus;* the glands of each side of the body are connected by a continuous longitudinal duct which opens into the pharynx. Similar glands appear to occur in most *Lumbricidæ* in the form of unicellular glands attached to the pharynx.

Alimentary tract.

Another series of glandular structures are connected with the pharynx, which have been termed by Vejdovsky salivary glands; these are found in the *Enchytræidæ*, and consist of simple or branched tubes, which open into the hinder end of the pharynx at each side by a single duct; since these glands agree in their minute structure with nephridia, which are not found in the segments which contain the glands, it is probable that they represent slightly metamorphosed nephridia (Vejdovsky). Among earthworms *Urochæta*, *Diachæta*, and *Acanthodrilus multiporus* possess a pair of glands at the anterior end of the body (glandes à mucosité, Perrier), which are larger and more complicated than the nephridia, though their structure is the same; in *Acanthodrilus* these glands open into the buccal cavity; in *Urochæta* they are branched and open on to the surface of the body on the one hand, and into the cœlom by several funnels (Beddard). It is possible that they are the homologues of the salivary glands in the *Enchytræidæ*.

The œsophagus is ciliated in the lower forms, but among earthworms cilia appear to be limited to that section of the œsophagus which lies behind the gizzard. The intestine, however, appears to be ciliated in all the *Oligochæta*. There is thus a gradual diminution in the ciliation of the alimentary tract in passing from the lower to the higher forms. In *Æolosoma* the whole canal from mouth to anus is ciliated. When the buccal cavity first appears it is lined with a cuticle, and has no cilia. The pharynx loses its cilia in the *Enchytræidæ*, while the rest of the alimentary tract is ciliated. Among earthworms the cilia are partially wanting in the œsophagus, while the intestine is lined with a ciliated epithelium.

In some *Oligochæta* the œsophagus is furnished with a muscular dilatation, which is usually termed gizzard. This organ first makes its appearance among the *Naidomorpha*, but is absent from other genera of "*Limicolæ*." It is, on the contrary, present in nearly all earthworms; the gizzard is lined with a tall columnar epithelium, which secretes a specially thickened cuticle, and the muscular layers are enormously increased. In *Lumbricus* the gizzard lies at the posterior end of the œsophagus, but in all other earthworms it is succeeded as well as preceded by a section of œsophagus, as in *Nais*. In *Lumbricus*, as well as in many other genera of earthworms, the gizzard occupies two segments, and the septum dividing these segments has disappeared, or is at most represented by a few bands of muscle, which bind down the gizzard to the body-wall. On the other hand, in some earthworms as well as in the *Naidomorpha* the gizzard only occupies one segment. In *Digaster* and *Trigaster* there are, as the names of these genera imply, two or three separate gizzards, while in *Moniligaster* there are four or five. In *Trigaster* and *Moniligaster* each gizzard only occupies a single segment; it is possible that the single gizzard of *Lumbricus*, etc., which occupies two segments, is due to the fusion of two separate gizzards lying in as many consecutive segments.

The œsophagus in most earthworms is furnished with from one to six pairs of glandular diverticula, which are known as "calciferous glands" or "glands of Morren." Those glands produce a calcareous secretion.[1]

The intestine is wider than the œsophagus, but has much the same structure; in *Æolosoma* the walls of the intestine consist of little more than a single layer of ciliated cells, but in the higher forms this is surrounded by a layer of circular and longitudinal muscular fibres. A remarkable peculiarity distinguishes the intestine of the majority of earthworms; this is a longitudinal fold on the dorsal side which projects into the lumen of the intestine, and which is known as the "typhlosole" (Fig. 3, *t*). A typhlosole does not exist in *Pontodrilus* nor in any known limicolous form. In *Perichæta* the intestine is furnished with one or more pairs of short cæca; in *Megascolex* and other genera there are series of compact glands opening into the intestine.

Reproductive Organs.—The *Oligochæta* are, so far as is known, invariably hermaphrodite; in this particular they differ from the *Polychæta*, where as a rule the testes and ovaries are found in distinct individuals. Among the *Polychæta*, however, *Protula* and other *Serpulidæ* are hermaphrodite. The reproductive organs consist of testes and ovaries, with their ducts, and spermathecæ, which are filled with spermatozoa during copulation. The reproductive glands are developed as a proliferation of the peritoneal epithelium, but are restricted to one or two segments; these organs, moreover, have a definite form, and are commonly surrounded by a layer of

Reproductive organs.

[1] For an account of the function of these glands, as well as of the part which earthworms play as geological agents, see Darwin, *Formation of Vegetable Mould*, etc.

cells of different nature from the sexual cell which make up the substance of the gland.

(1) *Male Reproductive Organs.*—(*a*) *Testes.*—In *Lumbricus* these organs consist of two minute pairs of solid cellular masses attached close to the median ventral line upon the posterior face of the septa which divide segments 9–10 and 10–11 (Fig. 4). These organs were first discovered by Hering. In the majority of earthworms (*Acanthodrilus, Eudrilus, Perichæta*, etc.) there is an identical number of testes occupying the same segments. It is probable but not yet proved that in *Urochæta* and *Moniligaster*, where there is only a single seminal reservoir and vas deferens on each side, there is but one pair of testes; at any rate, in *Typhæus*, where the seminal reservoirs and vasa deferentia are single, there is but one testis on each side placed in the 10th segment.

Among the "*Limicolæ*" there is rarely (*Phreoryctes*) more than a single pair of testes, which may be in the 5th (*Naidomorpha*), 9th (*Lumbriculidæ*), 10th (*Tubifex*), or 11th (*Enchytræus*, etc.) segment.

(*b*) *Seminal Reservoirs.*—The spermatozoa are not, however, developed within the testes, but in special receptacles, the seminal reservoirs (seminal vesicles, vesiculæ seminales). These structures frequently enclose the testes, with which they have been confounded by many writers. By the earlier writers the seminal reservoirs were regarded as ovaries; this opinion was due to the numerous parasitic Gregarines which these organs contain; the encysted parasites were mistaken for ova. In *Lumbricus terrestris*, etc. (Bergh), there is a single median reservoir, which encloses the testes, the funnels of the vasa deferentia, and the nerve cord in each of segments 9 and 10; with these are connected three pairs of lateral outgrowths situated respectively in segments 8, 10, and 11. In *Allolobophora fœtida* there are four pairs of isolated seminal reservoirs in segments 8, 9, 10, and 11; there is no median unpaired portion; and the testes as well as the vasa deferentia lie freely in the body cavity; the first two pairs lie on the posterior septa of their segments, and open by an aperture into the cavity of the segment behind; the last two pairs lie upon the anterior septa of their segments, and open into the cavity of the segment in front. In all cases the seminal reservoirs are formed as outgrowths of the septa. The cavity of the

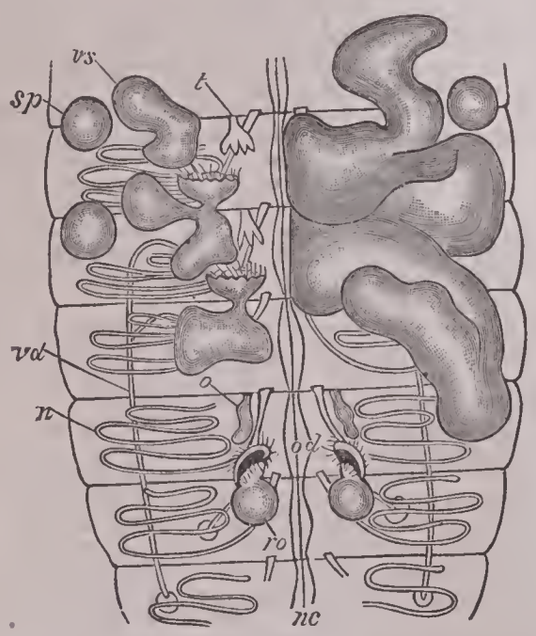

FIG. 4.—Genital Segments of *Lumbricus* (slightly altered from Howes, *Biological Atlas*). The left side represents the immature, the right the mature condition, so far as the male reproductive organs are concerned. *t*, anterior pair of testes (the second pair are in the next segment); *vs*, seminal vesicles; *sp*, spermathecæ; *vd*, vas deferens; *o*, ovary; *od*, oviduct; *ro*, receptaculum ovorum; *n*, nephridia; *nc*, nerve cord.

seminal reservoirs is broken up by anastomosing trabeculæ, in the interstices of which the spermatozoa undergo their development. There is very great variety among earthworms in the number and arrangement of the seminal reservoirs, but there is no form known in which they are absent. In *Urochæta, Typhæus, Titanus*, and *Diachæta* there appear to be only a single pair, which are of great length. In *Diachæta* (Benham) they occupy 26 segments.

In many of the "*Limicolæ*," as was first proved by Lankester in *Tubifex*, seminal reservoirs are found; and where their development has been traced they appear to originate as outgrowths of the septa. In some of the simpler forms, *e.g.*, *Chætogaster*, seminal reservoirs are not developed, but the testicular products float freely in the perivisceral cavity, where they undergo their development.

(*c*) *Vasa Deferentia.*—It is a rule without any exceptions among the *Oligochæta* that the spermatozoa are carried out of the body by special ducts, which perform only this function. In this respect the *Oligochæta* are in marked contrast to the *Polychæta*, where the ripe spermatozoa are either set free by a rupture of the body-wall, or are conveyed to the exterior by means of the nephridia, which, however, may be slightly modified in relation to this function. These ducts are termed vasa deferentia; they invariably open freely into the body cavity, and only sometimes (*e.g.*, *Lumbricus*) acquire a secondary relation with the testes by way of the seminal reservoirs; they are developed independently of the testes. In the *Hirudinea* and Platyhelminths, on the other hand, the efferent ducts are *continuous with the testes*, of which they appear to be mere outgrowths; Nussbaum has, however, recently (*Zool. Anzeiger*, viii. p. 181) stated that in *Clepsine* the vasa deferentia are developed independently of the testes.

In their simplest form (in many *Enchytræidæ*) the vasa deferentia consist of a single pair of convoluted tubes, which open by a wide funnel-shaped aperture into one segment, while the external aperture is situated in the following segment. Very generally in those *Oligochæta* the funnel-shaped expansion is continued into a wide cylindrical tube, which narrows abruptly on passing through the intersegmental septum into a slender tube; the walls of both sections of the vas deferens are formed of cylindrical ciliated cells; the external aperture is often surrounded by several rows of large glandular cells. Among a large number of the lower *Oligochæta* there is a single pair of vasa deferentia, which occupy in the same way two segments; the internal funnel-shaped aperture opens into one segment, while the greater part of the tube and the external orifice are situated in the following segment. A further complication is, however, introduced in the form of a glandular terminal organ, which opens on to the exterior by one extremity, and communicates with the vas deferens at the other. In *Stylaria lacustris* this organ is pear-shaped, narrowing towards the external aperture; it is lined by a layer of cylindrical glandular cells, outside of which is a layer of muscular fibres; the whole organ is covered by large peritoneal cells of a glandular appearance. This organ is termed the *atrium*; the vas deferens, which is short, only curved (not convoluted), opens by one end into the broad extremity of the atrium, and terminates in a ciliated funnel, which has this peculiarity that it does not lie in the segment in front, but in the same segment (in the 6th) as the atrium; it is, however, closely applied to the intersegmental septum of segments 5–6.

This condition of the vasa deferentia is exactly repeated in the earthworm *Moniligaster barwelli*; the seminal reservoirs (Beddard) lie partly in the 8th and partly in the 9th segment; the vas deferens, which is much coiled, lies in the same segment; it is continuous at one end with the seminal reservoir, and at the other with a glandular body opening between segments 9–10, which has a structure apparently identical with that of the atrium of *Stylaria*. *Chætogaster diaphanus* (Vejdovsky, 15) has the same general disposition of the vasa deferentia, but the atrium is divided into a glandular "vesicula seminalis," into which opens the vas deferens, and a distal non-glandular portion, which can be everted during copulation.

The reproductive ducts of the *Tubificidæ* are still further complicated in their structure. In *Tubifex rivulorum* the structure of the atrium at an early stage is like that of *Stylaria*; a simple globular or pear-shaped atrium is formed as an invagination of the integument; later this is differentiated into two parts, as in *Chætogaster*; an additional structure is, however, developed in the form of a group of unicellular glands, collectively termed the prostate, which open into the glandular distal region of the atrium; in the adult *Tubifex* the proximal section of the atrium is developed into a protrusible penis; this is surrounded by a second invagination of the integument, which forms a penis sheath and part of the penis proper. The glandular part of the atrium (vesicula seminalis) is ciliated, but cilia are wanting in the penis. In *Telmatodrilus* (Eisen) the prostates are very numerous, and arranged in pairs; in *Psammoryctes* (Vejdovsky) and in *Hemitubifex* (Eisen) the upper part of the vesicula seminalis, into which open the vas deferens and the prostate, forms a globular chamber distinct from the remainder of the atrium.

Another type of efferent apparatus is found in the *Lumbriculidæ*. In *Stylodrilus* there is a single pair of atria, which have much the same structure as in *Stylaria*, but the proximal end of the organ is less glandular and can be everted as a penis. With each atrium, however, are connected two vasa deferentia; one of these opens by a fun-

nel-like expansion into the segment in front, the other passes back into the segment behiud that which contains the atrium, and after again perforating the septum opens by a funnel-shaped expansion into the atrial segment. Among earthworms *Moniligaster*, as already stated, is furnished with an efferent apparatus exactly comparable to that of the lower "*Limicolæ*." In other genera the same divisions can be recognized in the efferent apparatus, which may also be siugle or double. In all earthworms, however, with the exception of *Moniligaster*, the interual funnels are situated several segments in front of the external pore, instead of being placed in the next segment. This is the case also with *Ocnerodrilus* (Eisen), a form usually referred to the "*Limicolæ*." *Urochæta* and *Typhæus* are the only genera known, besides *Moniligaster*, in which there is a single vas deferens on each side. Iu all others there are a pair of vasa

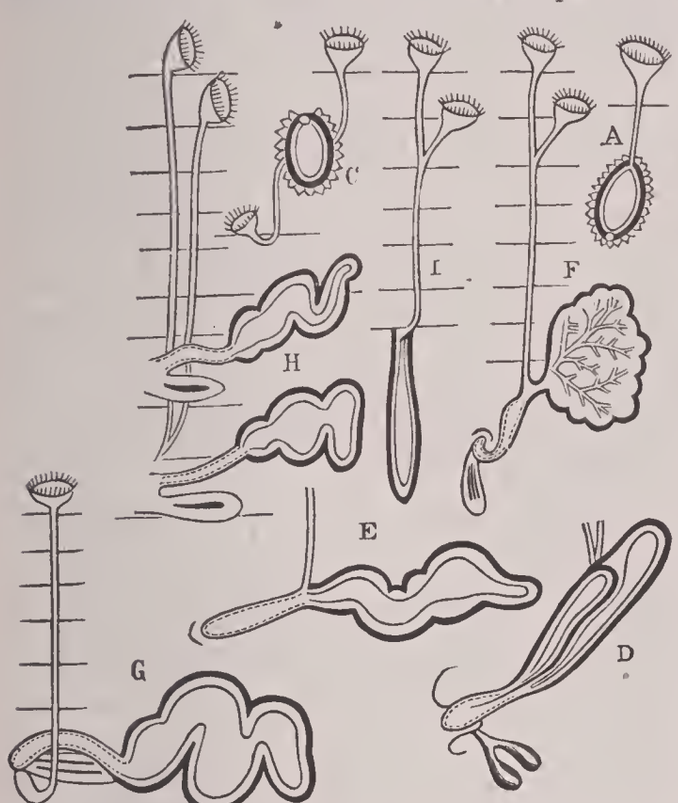

FIG. 5.—Male Genital Ducts of Various *Oligochæta*. In most cases the whole length of the vasa deferentia is shown; the transverse lines indicate the boundaries of the segments through which they pass. The thick black lines indicate the atria, the dotted lines the muscular part of the atria. In F, G, H the penial setæ are shown lying in a sac opening in common with the atria. A, *Moniligaster barwelli* (outside the atrium in A and C is a layer of glandular tissue); C, *Phreatothrix pragensis* (after Vejdovsky); D, *Eudrilus silvicola*; E, *Pontodrilus marionis*; F, *Perichæta armata*; G, *Typhæus gammii*; H, *Acanthodrilus novæ-zelandiæ*; I, *Ocnerodrilus* (after Eisen).

deferentia on each side, which open by separate fuunels into two consecutive segments (10th and 11th); the vasa deferentia open on to the exterior by a common pore; they may become united into a single tube in the segment behind that which contains the posterior funnel (*Lumbricus*, *Perichæta*), or one or two segments farther back (*Microchæta*), or, finally, as in *Eudrilus*, they may unite in the terminal apparatus.

The structure of the vasa deferentia and the funnels corresponds to that of the lower *Oligochæta*, except that the funnels are usually much plicated. In *Lumbricus*, *Urochæta*, etc., the vasa deferentia open directly on to the exterior; in other types, however, an atrium can be recognized. The most primitive form of these organs (iu some respects) is seen in the genus *Eudrilus* (Beddard, 3); the two vasa deferentia open into the interior of a glandular organ, which is probably the homologue of the atrium; this organ is divided into two parts by a longitudinal septum, but is covered by continuous layers of muscles; it communicates with two muscular tubes, also covered by a continuous layer of muscle which unite into a siugle muscular penis, which is probably eversible. The penis, like the atrium, is lined by a single layer of non-ciliate cells; the cells of the glandular portion are non-ciliate, and are arranged in two layers; the penis projects into the interior of a cavity open to the exterior; this corresponds to the penis sheath of the *Naidomorpha*. With the penis sheath ("bursa copulatrix," Perrier) is also connected a small rigid diverticulum with muscular walls.

It is not certain whether the partial longitudinal division of the atrium and vesicula represents the partial fusiou of the primitively distinct atria or the commencing separation into two parts of a single atrium; the latter alternative, on the whole, is the more probable.

In *Perichæta*, *Acanthodrilus*, etc., certain glandular bodies are connected with the termination of the vas deferens, which have been termed "prostates." These glands are of two kinds: (1) in *Acanthodrilus*, *Pontodrilus*, etc., they consist of a single somewhat convoluted tube of uniform diameter; (2) in *Perichæta*, etc., they have a racemose lobulated appearance. It is probable that these structures are homologous. The prostates of *Perichæta* (Fig. 5, F) are made up of numerous ductules, which are connected with groups of cells that have the character of unicellular glands; each cell is conuected by a long stalk with the termiuation of the ductule; in *Acanthodrilus*, etc., the prostate is lined by a double layer of cells which surround a central lumen; the innermost layer of cells are narrow and columnar, the outer layer are large pear-shaped glandular cells. The difference between the two organs is this: iu *Perichæta* the glandular cells have become segregated into groups, while the lumen of the gland is branched. Jn at least one species of *Perichæta* both these differences from *Acanthodrilus* are less marked.

The so-called prostates of *Acanthodrilus* and *Pontodrilus* agree in their minute structure with the vesicula seminalis of *Eudrilus*, and they open on to the exterior, like the corresponding structures in *Perichæta*, by a thick-walled muscular tube; the vas deferens, however, is connected in *Pontodrilus* with the muscular part of the atrium, and not with the vesicula; the condition of the efferent apparatus is therefore a more modified one. In *Typhæus* this modification is carried still further: the vas deferens enters the body-wall independently of the vesicula and atrium, and only joins the latter below the epidermis just before its opening on to the exterior. If Vejdovsky be right in interpreting the so-called receptaculum seminis of *Ocnerodrilus* (Eisen) as the atrium, the relations of the several parts of the efferent system iu this worm are much the same as in *Typhæus*. In *Acanthodrilus* (Fig. 5, H) the two pairs of atria open on to the 17th and 19th segments respectively; the vasa deferentia open on to the 18th independently of them.

(*d*) *Genital Setæ*.—It is commonly the case among the *Oligochæta* that the setæ upon the clitellum, in the neighborhood of the spermathecæ and the male sexual apertures undergo a certain amount of modification. Thus in *Lumbricus* the setæ in these regions of the body are longer aud more slender than the setæ elsewhere (Hering); in *Urochæta* aud *Thamnodrilus* the setæ upon the clitellum are ridged. Analogous modifications are found in *Nais* and other "*Limicolæ*." The function of these setæ is probably, as Lankester has suggested, to assist in attaching the worms together during copulation. Before the individual is mature these setæ are absent, and the ordinary setæ occupy their place; when the clitellum is developed the ordinary setæ drop out, and are replaced by the genital setæ (Vejdovsky).

In *Acanthodrilus*, *Typhæus*, and some species of *Perichæta*, the apertures of the atria are furnished with a thin-walled muscular diverticulum in which are found a bundle of extraordinarily long setæ; these can be protruded through the sexual orifice and may possibly serve to assist in the transference of the sperm to the spermathecæ of another individual. These setæ may be termed "penial" setæ (Lankester) (Fig. 2, *a*, *b*).

(2) *Female Reproductive Apparatus* — (*a*) *Ovaries*.— The ovaries of *Lumbricus* were first discovered by D'Udekem; they consist of a pair of minute pear-shaped bodies attached to the anterior septum of the 13th segment (Fig. 4, *o*); their position exactly corresponds to that of the testes, and like those organs they are covered by a delicate layer of flattened peritoneal cells. In *Perichæta* and *Acanthodrilus*, where the testes are prolonged into numerous digitate processes, the ovaries have an identical form; finally, the contents of the young ovaries and testes consist of entirely similar germinal cells (Bergh); these facts all tend to prove the serial homology of the ovaries and testes. With the exception of *Euclipidrilus* and *Phreoryctes*, the *Oligochæta* possess but a single pair of ovaries, which appear to be invariably[1] placed behind the testes.

(*b*) *Receptaculum Ovorum*.—Corresponding to the seminal reservoirs are a pair of outgrowths from the posterior side of the septum which separates segments 13–14; the ripe or nearly ripe ova are stored in these receptacles. Their presence in *Lumbricus* was first discovered by Heriug. They have the same structure as the seminal reservoir; their

[1] *Plutellus* is, according to Perrier, an exception; the ovaries are in front of the testes.

cavity is similarly divided by anastomosing trabeculæ; and they have been proved by Bergh (19) to originate in the same way. In *Moniligaster* (Horst) these bodies are of large size, and therefore resemble more closely the seminal reservoirs. They are generally present in earthworms. Among the *Naidomorpha* organs are met with which appear to resemble the receptacula. In *Stylaria lacustris* a pair of delicate sacs are developed in the same segment as that which contains the ovaries; in these the ova undergo their development: the extremity of the sac encircles the ovary so that the ova can readily find their way into it. This organ is however, compared by Vejdovsky (15) to the delicate peritoneal covering of the ovary in *Lumbricus*, and more particularly to a tube-like projection of this peritoneal covering at the free extremity of the ovary where the ripe ova are found.

(*c*) *Oviduct.*—The oviducts in *Lumbricus* are two minute trumpet-shaped bodies composed of a single layer of ciliated cells; the funnel-shaped expansion opens into the 13th segment; the tube perforates the mesentery, and opens on to the exterior in the 14th segment. The mouth of the oviduct is in close relation with the aperture of the receptaculum ovorum into the same segment. In most earthworms a pair of oviducts of similar structure have been recognized; in *Perichæta* the two oviducts open by a common pore situated in the median ventral line of the 14th segment. The apertures of the oviducts are, with the exception of *Moniligaster* (Horst) and *Allurus* (Beddard, 5), invariably placed in front of the male generative pores. Among the "limicolous" forms oviducts have been described in *Rhynchelmis*, *Phreoryctes*, and *Phreatothrix;* in these genera, however, the oviducts consist of little more than the funnel which is sessile on the ventral body-wall of the 11th segment, and opens on to the exterior in the groove between this and the following segment; in *Phreoryctes*, Beddard (6) there are two pairs of oviducts entirely contained in one segment. It is important to note that in *Rhynchelmis* and *Phreatothrix* the female pore is behind the male pore, while in earthworms (except *Moniligaster*, *Allurus*) it is in front. Among the lower *Oligochæta* oviducts are absent; their place is taken in the *Enchytræidæ* and others by a pair of slit-like orifices placed on the clitellar segment behind the apertures of the vasa deferentia. That these pores represent the external orifices of the oviduct in the higher forms is shown by the following considerations: (1) their position behind the male pores; (2) the probability urged by Vejdovsky that the clitellar segment really represents three fused segments, in which case the oviducal pores are really one segment behind the male efferent pores; (3) the remarkable analogy with the *Cyclostomata* among fishes, where the abdominal pores act as oviduct (Weber, *Zeitsch. f. wiss. Zool.*, 1887).

The ovaries and oviducts of *Eudrilus* (Beddard, Horst), differ in many particulars from those of other *Oligochæta*. The ovaries (Fig. 6) are two solid bodies situated on the anterior septum of segment 14. They are surrounded by layers of muscles, and the interior is divided by trabeculæ into numerous compartments; directly continuous with each ovary is a contorted tube which passes through the septum into the 13th segment, and then again passes through the septum, and opens on to the exterior in the 14th segment, in common with a large spermathecal pouch and a small glandular body. The oviduct opens by a wide mouth into the interior of the ovary, and is lined throughout with a ciliated epithelium; it is covered by layers of muscular fibres, which are continuous with those of the ovary. The continuity of the ovary and its duct is unknown in any other *Oligochæta*, but is analogous to the condition of the ovaries and their ducts in the leeches. It is possible that the muscular wall of the ovary is to be regarded as an hypertrophy of the peritoneal covering of the ovary in *Lumbricus*, etc., and that this has involved the oviduct; or the muscular coat of the ovary may be regarded as the receptaculum ovorum, which as in *Stylaria*, is developed in the same segment as the ovary; this supposition is strengthened by the fact that the oviduct traverses the septum between the 13th and 14th segments.

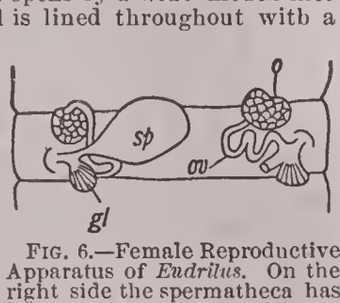

FIG. 6.—Female Reproductive Apparatus of *Eudrilus*. On the right side the spermatheca has been cut away to show the contorted oviduct *ov*. *o*, ovary; *sp*, spermatheca; *gl*, gland opening into conjoined duct of spermatheca and oviduct.

Spermathecæ.—Of these organs there are from one to eight pairs; they consist of spherical or pear-shaped vesicles, often furnished with accessory diverticula. They receive the semen during copulation and by their epithelium is fabricated the generally chitinous spermatophore in which the spermatoza are enveloped, and in which they are conveyed to the neighborhood of the clitellum of another individual.

The genital ducts have been compared with nephridia by many writers; there is not only a considerable anatomical resemblance, but a developmental similarity; the vasa deferentia (and the oviducts?), like the nephridia, consist of a funnel, of a more or less elongated tubule, and of a distal vesicular part. The *intra*cellular duct of the nephridium and the *inter*cellular duct of the vas deferens may be explained by the different functions which the organs perform."[1] The spermathecæ, on the other hand, are comparable to the vesicle of the nephridium, which is formed in both cases by an ectodermic ingrowth. The fact that the funnel and the tubule in both cases are developed independently, but both from the mesoblast, is a striking point of similarity between the vasa deferentia and oviducts and the nephridia. The belief of Claparède that in the "*Limicolæ*" the genital ducts were the homologues of nephridia, but not in the "*Terricolæ*," was based upon the erroneous assumption that nephridia are absent in the genital segments of the former. This has been shown by Vejdovsky to be an error: nephridia are present at first in the genital segments, but degenerate and disappear when the genital ducts are formed. Moreover, enough has been already said to prove the extreme unlikelihood of a non-homology between the generative ducts in earthworms and those in the "limicolous" forms. Lankester put forward the theory that there were primitively two pairs of nephridia in each segment, each series being connected with one of the pairs of setæ; the genital ducts were supposed to be the remains of one series which had aborted except in the genital segments. This theory was at first espoused by Perrier, who found that the nephridia were sometimes connected with one series of setæ and sometimes with the other, and sometimes (*Plutellus*) alternated from segment to segment, opening in one segment by the ventral and in another by the dorsal setæ; these facts appeared to show that one or other of the two series of nephridia was partially or entirely retained in different genera. In his later publications Perrier was not inclined to attach much weight to this hypothesis, inasmuch as it did not satisfactorily refer the genital ducts to one or other of the presumed double series of nephridia; the apertures of the genital ducts and nephridia were found occasionally to coincide at the same pair of setæ.

The discovery that each segment of a worm may contain numerous nephridial pores disposes of any *a priori* difficulties as to the homology between nephridia and genital ducts, though the question is far from being settled.

Classification and Affinities.—It has already been stated that the *Oligochæta* form a group which cannot be subdivided into *Limicolæ* and *Terricolæ* as was proposed by Claparède. The genera of *Oligochæta* have been arranged in families by Vejdovsky (14), to whom the reader is referred for a classification, which is satisfactory as regards the "limicolous" forms, and some of the families (*e.g.*, *Lumbricidæ* and *Perichætidæ*) of earthworms. Since that time, however, a large number of new genera and species of earthworms have been described, which cannot at present be satisfactorily arranged. Perrier divided earthworms into three groups: (1) *Preclitellians* (*e.g.*, *Lumbricus*), where the male pores are situated in front of the clitellum; (2) *Intraclitellians* (*e.g.*, *Eudrilus*), where the male pores are within the clitellum; and (3) *Postclitellians* (*e.g.*, *Perichæta*), where the male pores open behind the clitellum. Advancing knowledge has shown this classification to be untenable, for two principal reasons: first, because it separates some species of *Acanthodrilus* which are postclitellian from others which are intraclitellian, and it separates the intraclitellian *Megascolex* from the postclitellian *Perichæta*, between which genera there are numerous points of affinity; and, secondly, because this classification is based on the assumption that earthworms can be considered as a group apart from other *Oligochæta*, whereas it is now impossible to draw any line of division between any two such groups. Classification.

The simplest forms of *Oligochæta* are the genera *Æolosoma* and *Ctenodrilus*. *Æolosoma* has a "head," consisting of one segment which contains the pharynx. The nervous system consists of cerebral ganglia, which are placed in the first segment, and retain connection with the epiblast; the apparent absence of a ventral nervous cord is in all probability to be looked upon as evidence of degeneration. The

[1] The difference between the nephridia and genital ducts in this respect cannot be regarded as being of importance; the nephridia of *Polychæta* differ from those of *Oligochæta* in having an intercellular lumen. Lang, moreover, has shown ("Die Polycladen," *Naples Monographs*) that in some Planarians the reproductive ducts, like the nephridia, may have an *intra*cellular lumen.

body possesses considerable traces of the primitively continuous ciliation; upon the head are a pair of ciliated pits. In all these particulars, as well as in the characters of the vascular system, *Æolosoma* agrees with *Ctenodrilus;* the latter form has, however, a ventral nerve cord, which, like the cerebral ganglia, is lodged in the epidermis. In most of these points *Æolosoma* and *Ctenodrilus* resemble larval forms of the higher *Oligochæta*. The reproductive organs of *Ctenodrilus* are not known, but those of *Æolosoma* are constituted on the Oligochætous plan. These two genera are also closely allied to the *Archiannelida*, of which a short description is appended, as they are not treated elsewhere in this work.

Æolosoma therefore retains certain Archiannelid characters, but is to be referred to the *Oligochæta* on account of—(1) the limitation of the reproductive glands to two segments and the presence of special efferent testicular ducts; (2) the paired arrangement of the setæ bundles, which agree in their structure with those of other *Oligochæta*, and (3) the relative complication of the nephridia, as compared with *Archiannelida*.

The affinities of *Ctenodrilus* are not so plain; but, in the absence of any knowledge respecting the generative organs, it is impossible to refer them definitely to the *Oligochæta* or to the *Polychæta*.

Archiannelida.

Archiannelida—This subclass includes certain small marine worms which were formerly placed among the *Polychæta*. Hatchek originally created the group for the reception of *Polygordius* and *Protodrilus;* and recently Föttinger has placed *Histriodrilus*[1] (an animal formerly referred to the *Discophora*) in the same group. The name *Archiannelida* implies that these forms stand at the base of the *Annelida*, and that they represent most nearly the common ancestral form from which both the *Polychæta* and *Oligochæta* have been derived. Their structure, which bears out this supposition, suggested the name.

Polygordius is found on the northern and southern coasts of Europe; it is a small slender worm, varying in length (according to the species) from 30 m. to 1 decim. The segmentation is hardly marked externally. The head segment is divided as in the *Chætopoda* generally into a prostomium and a peristomial ring; the prostomium gives rise to two tentacles. On either side of the prostomium is a ciliated pit, which is of special interest, as it occurs on the one hand among the NEMERTINES (*q.v.*), and on the other among certain *Polychæta* (*e.g.*, *Ophelidæ*), and in the lowly organized Oligochæt *Æolosoma*. Cilia are found in certain species in the neighborhood of the mouth and on the anal segment.

The ciliation of the body is more marked in *Protodrilus*, where there is a continuous ventral groove lined by cilia; there are rings of cilia also on each segment. The partial ciliation of *Polygordius* is to be derived from this by reduction. Certain *Oligochæta* retain traces of the primitive ciliation of the body (*e.g.*, *Æolosoma*).

There are no traces of setæ in *Polygordius* or its allies. The segmentation of the body, although hardly marked externally, is very clearly marked internally; the body-cavity is divided by successive septa into a series of segments; there is no such fusion of the anterior segments as is met with among the *Polychæta* and *Oligochæta*, and the segments are less differentiated among themselves than is usually the case in the higher *Chætopoda*. The head segment contains the pharynx, which is limited to this segment; the nephridia, which consist of simple tubes (probably but not certainly formed of a chain of "drain-pipe" cells, as in *Oligochæta*), are found in all the segments except the first and last. The nephridia do not lie freely within the cœlom, but in the thickness of the parietal peritoneum; the funnel only just opens into the cavity of the segment preceding that which bears the external pore; that is to say, it is chiefly contained within the thickness of the septum.

In having the form of simple sinuous (not coiled) tubes, and in lying within the peritoneum, the nephridia are in a very archaic condition; the same thing occurs in the *Capitellidæ;* in the higher Annelids the nephridia lie within the cœlom, and are usually much coiled and complicated in structure.

The vascular system consists of a dorsal and a ventral trunk, which traverse the thickness of the dorsal and ventral mesenteries. The development of these vessels shows that their cavity is continuous with the blastocœle, and is not a secondary canalization of a solid chain of mesoblast cells, as is so commonly the case in the *Annelida*. The two trunks communicate in every segment except the last two or three by two lateral vessels, one on each side; each of these latter gives off a cæcal tube running backwards along the somatic peritoneum. Thus the vascular system undergoes but little modification in different segments. In *Protodrilus* the bloodvessels have no walls, and therefore permanently retain a condition which is found in the young *Polygordius* before the adjacent mesoblast cells have become differentiated into an extremely delicate membrane. The condition of the vascular channels in *Polygordius* represents that of the larval *Polychæta* and *Oligochæta* before the special muscular walls have been formed. *Æolosoma*, however, is identical with the adult *Polygordius* in these particulars.

The digestive tube consists of only a single layer of ciliated cells covered by a single layer of peritoneal cells, and is therefore in an embryonic condition as compared with the *Chætopoda* and *Oligochæta*. It is, however, specialized into a pharynx, œsophagus, and intestine. The nervous system is extremely simple, and lies in the thickness of the epidermis, thus presenting an embryonic character, which is, however, met with in certain *Polychæta*.

In *Polygordius* the cerebral mass is situated in the prostominm, and communicates by a circumœsophageal commissure with a ventral cord which is single and median, and shows no trace of ganglionic enlargements. In *Protodrilus* there are two ventral cords, while in *Histriodrilus* there are a series of ganglionic swellings. A nervous plexus also exists in the thickness of the longitudinal muscles.

Polygordius is of separate sexes; *Protodrilus* is hermaphrodite. The sexual products are developed in all except the first few and last few segments from the lining of the cœlom; the ova and spermatozoa are apparently liberated by the rupture of the body-wall. *Histriodrilus* has special efferent ducts for the ovaries and testes (found in different individuals), the nature of which is not yet settled.

Polygordius leaves the egg as an active larva, first discovered by Loven. This larva is shaped like a humming-top, and has a preoral circlet of cilia; immediately behind this on one side is the mouth, which leads into an alimentary canal opening at the posterior end of the body; at the apical region is an ectodermic thickening.

WORMS, one of the oldest, and from an historical point of view one of the most interesting, cities in Germany, is situated on the left bank of the Rhine, in the grand-duchy of Hesse-Darmstadt, 25 miles south of Mainz and 20 miles northwest of Heidelberg. The town is irregularly built, and some of the old walls and towers still remain, but its general aspect is modern and commercial. The chief squares are the market-place and the Dom-Platz. Worms formerly contained many ecclesiastical buildings, now represented by eight churches, two of which, however, are no longer used for divine service. The principal church and chief building is the spacious Romanesque cathedral, which ranks beside the cathedrals of Spires and Mainz among the famous ecclesiastical edifices of the Rhine. This magnificent building, with four round towers, two large domes, and a choir at each end, has a specially imposing exterior, though the impression produced by the interior is also one of great dignity and simplicity, heightened by the natural color of the red sandstone of which it is built. In this last particular it differs from the cathedrals of Mainz and Spires, where the natural color of the stone no longer appears in the interior. Only the lower part of the western

[1] The correct name of this worm is *Histriobdetta*. The altered termination is to express the change in the view regarding its affinities.

[2] This work is a general summary of investigation into anatomy of *Oligochæta* up to 1884, with complete list of literature. For this reason the present bibliography refers only to more important papers published since that date.

towers belongs to the original building, consecrated in 1110; the remainder dates from 1181, with the exception of the west choir and the vaulting, which were built in the 13th century, and the elaborate south portal, which was added in the 14th century. The ornamentation of the older parts is simple to the verge of rudeness; and even the more elaborate later forms show no high development of workmanship. The church is 485 feet long and 114 feet wide; the transepts, which are at the west end, are about 120 feet long (inside measurement), and the choir is 160 feet high. The cathredral belongs to the Roman Catholic community, who possess also the church of St. Martin and the Liebfrauenkirche, a handsome gothic edifice outside the town, finished in 1467. The principal Protestant place of worship is Trinity church, built in 1726. Second in interest to the cathedral is the church of St. Paul, also in the Romanesque style, and dating from 1102–16, with a choir of the early 13th century. It is adjoined by the remains of an abbey and cloisters of various epochs. Since 1881 this church has obtained an interesting museum of national antiquities. The late Romanesque St. Andrew's church is also used for secular purposes. The synagogue, an unassuming building erected in the 11th century and restored in the 13th, is now completely modernized. The Jewish community of Worms (about 1400 in number) claims to be the most ancient in Germany, and to have existed continuously since before the Christian era, though the earliest authentic mention of it occurs in 588. A curious tradition, illlustrating the efforts of the dispersed people to conciliate their oppressors, asserts that the Jews of Worms gave their voice against the crucifixion, but that their messenger did not arrive at Jerusalem until after the event.

The town-house of Worms was restored in 1884. The Bischofshof, in which the most famous diet of Worms (1521) was held, is now replaced by a handsome modern residence. The Luginsland is an old watch-tower of the 13th century. Worms also contains numerous schools and a richly endowed hospital. In the Luther-Platz rises the imposing Luther monument (unveiled in 1868), consisting of a series of twelve statues on a platform 16 feet square. In the centre the colossal statue of Luther rises, on a pedestal at the base of which are sitting figures of Peter Waldus, Wycliffe, Huss and Savonarola, the heralds of the Reformation; at the corners of the platform, on lower pedestals, are statues of Luther's contemporaries, Melanchthon, Reuchlin, Philip of Hesse, and Frederick the Wise of Saxony, between which are allegorical figures of Magdeburg (mourning), Spires (protesting), and Augsburg (confessing). The greater part of the work, which took nine years to execute, was designed by Rietschel, and carried out after his death in 1861 by Kietz, Dondorf, and Schelling.

The trade and industry of Worms are not unimportant. The leading resource of the inhabitants is wine-growing, the most famous vintage being known as Liebfrauenmilch, grown on vineyards near the Liebfrauenkirche. Luginlander, and Katterlocher are also well-known varieties. The manufacture of patent leather employs 3000 hands. Machinery, chicory, slates, etc., are also produced. Worms possesses a river-harbor, and carries on some trade by water. The population in 1885 was 21,903, of whom about one-third were Roman Catholic. In its prosperous days Worms is estimated to have had from 40,000 to 70,000 inhabitants.

Borbetomagus, the name by which Worms was known in Roman times, seems to indicate a Celtic origin for the town. The modern name is usually connected with Wurm or Lindwurm, the German word for a dragon. Drusus is said to have erected a fort on the site of the town in 14 B.C. As a settlement of the Germanic tribe of the Vangiones, it existed under Roman protection till about the middle of the 5th century. The Burgundians then took it and made it their capital, and its name appears in many of the heroic legends of that people. King Gunther and Brunhilde held their court at Worms; and here Sigfried wooed the fair Chriemhild. The "Rosengarten," often mentioned in these legends, lay on the opposite bank of the Rhine. Under the Franconians this town was also important; and it was a frequent residence of Charlemagne and his successors. The scene of the graceful though unhistorical romance of Eginhard and Emma, the daughter of Charlemagne, is laid at Worms. The first bishop of Worms of whom anything authentic is known was Erembert (670), though an "episcopus Vangionum" is said to have attended a council at Cologne in 347. Worms seems to have thriven under the bishops, but the citizens invariably espoused the cause of the emperors against them, and were rewarded by privileges which fostered the trade of the town and eventually led to its recognition as a free imperial city. Worms was frequently visited by the imperial court, and won the proud title of "Mother of Diets." The most famous diet was that held in 1521, at which Luther appeared to defend his doctrines before Charles V. Four years later the town formally embraced Protestantism. Worms preserved a tolerable prosperity even through the hardships of the Thirty Years' War; but in 1689 it was laid in ashes by the French, a blow from which it has never thoroughly recovered. The peace of Luneville annexed it in 1801 to France; but in 1815 it passed to Hesse-Darmstadt, being then an important town with 6250 inhabitants.

WORSBROUGH, a township in the West Riding of Yorkshire, is situated on a branch of the Dearne and Dove Canal, and near several branch lines of the Manchester, Sheffield, and Lincolnshire Railway, 9 miles northwest of Rotherham and 3 south of Barnsley. The church of St. Mary, an interesting structure with remains of Norman work, but chiefly in the Transition Early English style, underwent restoration in 1864. It contains some old monuments and brasses. There are extensive collieries and gunpowder mills in the neighborhood, and the township possesses iron and steel works and corn-mills. A short distance to the west is Wentworth Castle, built in 1730 by Thomas, earl of Strafford, on the site of an ancient fortress, and containing a large number of portraits of historical interest. The population of the urban sanitary district (3779 acres) was 6030 in 1871, and 8443 in 1881.

WORSTED. See WOOL.

WORTHING, a watering-place of Sussex, is situated on the London, Brighton, and South Coast Railway, 61 miles south of London and 10½ west of Brighton. On account of its sheltered situation at the foot of the South Downs it has some reputation as a health-resort for pulmonary complaints. As a general sea-side resort it is increasing in favor, especially with the wealthier classes. There is a marine parade 1¼ mile in length, a long range of firm sands, and an iron promenade pier, 960 feet in length, constructed in 1882. A public park, 21 acres in extent, was opened in 1881. The churches and chapels are all modern. The other principal buildings are the town-hall (1834), a quadrangular structure with square clock tower, Montague hall, the literary institute, the workmen's institute, the infirmary and dispensary (1882), the Thomas Banting memorial convalescent home, the public baths, erected in 1886, Humphrey's almshouses, and Queen Elizabeth's almshouses. The mother parish of Worthing is Broadwater, the church of which, three-quarters of a mile north of Worthing, a cruciform building in the Transition style, has some old monuments and brasses. The population of the urban sanitary district (979 acres) was 7401 in 1871, and 10,976 in 1881.

Pottery and other Roman remains have been found at Worthing. In Domesday the manor appears under the name of Ordinges, and consisted of eleven hides, or about 110 acres. In the reign of Edward I. it was valued at 100 shillings [$66.67]. It formed part of the endowment of the priory of Easebourne, near Midhurst, and at the Reformation was granted with other possessions to Henry Fitzwilliam, earl of Southampton. It afterwards passed through several hands to the earl of Warwick. It was of some importance in the reign of Edward III., who granted it the privilege of a market, but it declined to a poor fishing hamlet. Its rise

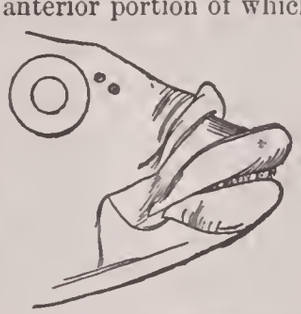
as a watering place began about 1760, and after a visit of the Princess Amelia in 1797 it made rapid progress.

WOTTON, Sir Henry (1568–1639), an accomplished literary amateur, was one of the favorite diplomatists of James I. of England, although, following the quietistic habit of his family, he never would undertake employments of the greatest weight and difficulty. The seat of the family, which was founded in the 14th century by a lord mayor of London, was Bocton or Boughton Malherbe in Kent. It was, as described by Izaak Walton in his *Life* of Sir Henry, a typical English family of wealthy landed gentry, keeping up a connection with the court, but avoiding the risks of factious ambition, often holding offices of high trust, but always prudently declining the highest. Henry, the youngest of four sons, was sent to school at Winchester, and thence to Oxford (New College and afterward's Queen's). At the age of twenty-two, with a high academic reputation for wit and scholarship, he was sent abroad to complete his education, and spent eight years in France, Spain and Germany, making acquaintance with men of learning as well as courtiers, a general favorite, Returning to England at the age of thirty, he sought political employment, and became one of the secretaries of Essex. On the fall of Essex he made his escape from England and took refuge at Florence, where he employed his leisure in writing a sketch of "the state of Christendom." While he was at Florence the grand-duke discovered a plot against King James, and Wotton was sent to Scotland with the information and a casket of antidotes. King James was so charmed with the emissary that on his accession to the English throne he at once offered Wotton ambassadorial employment. He might have had the embassy to Spain, but this he prudently declined, and chose instead the easier duty of managing relations with Venice and the German states. After twenty years of diplomatic service he craved and obtained the post of Provost of Eton in 1624. He had studied and written not a little at odd times during his active life, and when he settled at Eton he intended to write a life of Luther; but in this and other large literary projects he never got beyond the stage of collecting materials. In his fifteen years provostship he set an example of careful, dignified, and gracious supervision; and his wit, wisdom, courtesy, and benignity are well represented in the *Reliquiæ Wottianæ*, published with Walton's *Life* in 1651. Two of his witticisms are immortal,—his definition of an ambassador as an "honest man sent to lie abroad for the good of his country,"[1] and his advice to a young diplomatist to tell the truth, and so puzzle and confound his adversaries. He died in 1639.

WOTTON, William (1666–1726), is now remembered chiefly for his part in the famous "Battle of the Books," but to his own generation his *Reflections upon Ancient and Modern Learning* was only one of many proofs of his extraordinary amount and variety of scholarship. Born in 1666, the son of an English clergymen, rector of Wrentham, in Suffolk, he was one of the wonders of his age in precocity. He could translate from several languages at the age of five. He was under ten when he was sent to Cambridge, and he took the degree of B.A. at the age of twelve years and five months, having already created such a sensation by his linguistic attainments that Latin poems were addressed to him as a prodigy. In the Battle of the Books he took a judicious middle course between the extreme champions, Fontenelle and Temple, making a succinct, elaborate, and careful comparison between ancients and moderns in oratory, poetry, mathematics, philosophy, astronomy, botany, and other arts and sciences. His *Reflections*, the first edition of which appeared in 1694, show that his prodigious memory was not confined to languages, and that he possessed also strong judgment and argumentative power. The treatise may still be read with interest, as a survey of the state of various sciences at the close of the 17th century. Wotton, who was made D.D. in 1707, wrote also on subjects so diverse as fossils and Welsh laws, besides producing various historical works. He was engaged on his translation of the Welsh laws at the time of his death, which took place in 1726.

WOUWERMAN, Philip (1619–1668), a Dutch painter of battle and hunting scenes, was born at Haarlem, in May, 1619. He received the elements of his art instruction from his father, Paul Joosten Wouwerman, an historical painter of moderate ability, and he then studied under Jan Wynants, and for a short time under Evert Decker. Returning to Haarlem, he became a member of its guild of painters in 1640. In that city he seems to have led the rest of his singularly productive life, and there he died in May, 1668. About seven or eight hundred pictures are enumerated in Smith's *Catalogue Raisonné* as the work of Philip Wouwerman, but probably many of these are the productions of his brothers Peter and Jan, and of his many other imitators. His authentic works are distinguished by great spirit and animation, and are infinitely varied and full of incident, though dealing recurrently with cavalry battle-pieces, military encampments, scenes of cavalcades, and hunting or hawking parties. He is equally excellent in his vivacious treatment of figures, in his skilful animal painting, and in his admirable and appropriate introduction of landscape backgrounds. Three different styles have been observed as characteristic of the various periods of his art. His earlier works are marked by the prevalence of a foxy-brown coloring, and by a tendency to an angular form in the draughtsmanship; the productions of his middle period have greater purity and brilliancy; and his latest and greatest pictures possess more of force and breadth, and are full of a delicate silvery-gray tone.

WRASSE. This name is applied to the fishes of the family *Labridæ* generally, and more especially to certain members of the family to be mentioned hereafter. They are without exception inhabitants of the sea, very abundant in the tropical zone, less so in the temperate, and disappearing altogether on the confines of the Arctic and Antarctic Circles. Their body is generally compressed, like that of a carp, covered with smooth (cycloid) scales; they possess one dorsal fin only, the anterior portion of which consists of numerous spines.



Lips of *Labrus festivus*.

Many wrasses are readily recognized by their thick lips, the inside of which is sometimes curiously folded, a peculiarity which has given to them the German name of "lip-fishes." The dentition of their jaws consists of strong conical teeth, of which some in front, and often one at the hinder end of the upper jaw, are larger than the others. But the principal organs with which they crush shellfish, crustaceans, and other hard substances are the solid and strongly-toothed pharyngeal bones, of which the lower are coalesced into a single flat triangular plate. The majority of wrasses are beautifully colored, exhibiting extraordinarily varied patterns of permanent pigmentary colors, as well as evanescent reflections of the scales. All of them are surface fishes, living close to the shore or coral-banks. Rocky parts of the coast overgrown with seaweed are their favorite haunts in the temperate, and coral-reefs in the tropical seas. Some 450 species of wrasses (including Parrot-Wrasses) are known, chiefly from the tropics; some grow to a large size and are esteemed as food, whilst others, like the British species, are small and but rarely eaten.

Of the British wrasses the Ballan Wrasse (*Labrus maculatus*) and the Striped or Red Wrasse or Cook (*Labrus mixtus*) are the most common. Both

[1] The full story of this witticism is given in Walton's *Life*.

belong to the genus *Labrus*, in which the teeth stand in a single series, and which has a smooth edge of the præoperculum and only three spines in the anal fin. The ballan wrasse is the larger, attaining to a length of 18 inches, and, it is said, to a weight of 8 ℔; its colors are singularly variegated, green or brownish, with red and blue lines and spots; the dorsal spines are twenty in number. The cook wrasse offers an instance of well-marked secondary sexual difference,—the male being ornamented with blue streaks or a blackish band along the side of the body, whilst the female has two or three large black spots across the back of the tail. This species possesses only from sixteen to eighteen spines in the dorsal fin. The Goldsinny or Corkwing (*Crenilabrus melops*) is much more frequent on the southern coasts of England and Ireland than farther north, and rarely exceeds a length of 10 inches. As in other wrasses, its colors are beautiful, but variable; but it may be readily distinguished from the two preceding species by the toothed edge of the præoperculum. The three other British wrasses are much scarcer and more local, viz., Jago's Goldsinny (*Ctenolabrus rupestris*), with a large black spot on the anterior dorsal spines, and another on the base of the upper caudal rays; *Acantholabrus palloni*, which is so rarely captured that it lacks a vernacular name, but may be easily recognized by its five anal spines and by the teeth in the jaws forming a band; and the Rock-Cook (*Centrolabrus exoletus*), which also has five anal spines, but has the jaws armed with a single series of teeth.

On the Atlantic coasts of the Northern States of North America the wrasses are represented by the genus *Tautoga*, which is distinct from the European forms.[1] The only species of this genus, known by the names of Tautog or Blackfish, is a fish of considerable economic value, being much esteemed as food. It is caught in great numbers, and generally sold of a weight of about 2 ℔.

WRECK (in Low Latin *wreccum* or *warectum maris*) is a ship or goods cast on land by the sea in tidal waters. While still at sea such ship or goods do not constitute wreck but derelict, which includes flotsam, jetsam, and lagan (see FLOTSAM). In Roman law wreck was restored to the owner if he claimed it before a judicial tribunal within a year and a day, the *fiscus* waiving its claim after a constitution attributed to either Marcus Aurelius or Constantine. Theft from a wreck was regarded as aggravated by the helpless position of the owner, and the thief was liable for fourfold the loss if an action was brought against him within a year, after that time for the loss simply. Plunderers of wreck and exhibitors of false lights were also punished criminally. Most of the Roman law on the subject is contained in *Digest* xlvii. 9, *Code* xi. 5. The Leonine Constitutions, c. 64, made a concealer of wreck liable to the fourfold penalty. In France it was provided by the laws of Oléron (see SEA LAWS) that succor was to be afforded to shipwrecked persons, and their property returned to them. Wreck afterwards became a right of the crown (a right limited to one-third of the value by an ordinance of Francis I.), but was often granted to feudal seigneurs under the name of *droit de bris*. In England the rule seems in the time of Bracton (the reign of Henry III.) to have been the same as that of the Roman law, that wreck only belonged to the king if no claimant appeared within a year and a day. It would perhaps be more accurate to say that it vested in the crown, subject to be divested on proof of ownership within the period limited. The reason for this rule of law appears to be the necessity of enabling persons in authority to protect wreck from the pillage which it was otherwise certain to have undergone at a time when wreck was looked upon as legitimate prey of the wrecker. In Bracton (120, 5) it is said that even if a dog escaped, or if any certain mark were put upon the goods, it was no wreck. The Statute of Westminster the First (3 Edw. I. c. 4) is merely declaratory of the common law as it is found in Bracton. It enacts that, where a man, a dog, or a cat escapes alive out of a ship, such ship should not be adjudged wreck, but the goods should be saved and kept by view of the sheriff, coroner, or king's bailiff, and delivered into the hands of such as were of the town where the goods were found, so that if any sued for the goods, and proved that they were his or perished in his keeping within a year and a day, they should be restored to him without delay; if not, they should remain to the king, and where wreck belonged to another than the king he should have it in like manner. In both Bracton and the statute the escape of a living thing appears to be used rather as an example of a means of proof than as the sole means of proof. The latter, however, became the doctrine of the courts for centuries; it was wreck unless a living thing escaped, and as such part of the hereditary revenue of the crown, and expressly recognized by the Statute *Du Prærogativa Regis* (see PREROGATIVE). To hold inquests of wreck was by the Statute *De Officio Coronatoris* (4 Edw. I. c. 2) one of the duties of the coroner, of which he has only recently been relieved by the Coroners Act, 1887, repealing the Act of Edward I. In 1771 a return was made by Lord Mansfield to the older and more reasonable view of the common law as it stood in Bracton. That distinguished judge considered that the rule that it was wreck unless a living thing came to shore was contrary to principles of law, justice, and humanity, and that the escape of an animal was simply a medium of proof. It was the proof and not the escape that was the important fact.[2] Claims to wreck were, by Ric. II. c. 3, not cognizable in the Admiralty Court as was derelict, for that was in and upon the sea, while wreck must have touched the land before it became wreck. Unclaimed derelict was, like unclaimed wreck, a right of the crown, but in a different way. It was not a direct right *jure coronæ*, but claimed by the king in his office of Admiralty as an admiralty droit. As wreck in the last resort became crown property, it was never subject to forfeiture as a DEODAND (*q.v.*) where lives were lost. Wreck was frequently granted to subjects as a franchise, *e.g.*, to the lords of manors and to various maritime cities and boroughs, among others to the Cinque Ports. Within the Cinque Ports the serjeants of the Admiralty of the Cinque Ports still act as receivers of wreck (17 and 18 Vict. c. 120).

So stood the common law as affected by early legislation. It is now of comparatively small importance, as the law now depends chiefly on the Merchant Shipping Act, 1854, part viii., and the amendments introduced by later Acts.

The definition of wreck for the purposes of the Merchant Shipping Acts (which is in effect for all practical purposes) is considerably extended beyond its common law meaning. By s. 2 of the Act of 1854, it includes jetsam, flotsam, lagan, and derelict. By the Sea Fisheries Act, 1883, it is still further extended to include all fishing boats, all their small boats, all rigging gear or other appurtenances of fishing boats, all nets, lines, buoys, floats, or other fishing implements whatsoever found or picked up at sea whether marked or unmarked. The principal provisions of the Act of 1854 are as follows. The general superintendence throughout the United Kingdom of all matters relating to wreck is committed to the Board of Trade. No person exercising Admiralty jurisdiction is to interfere with wreck. Whenever any ship or boat is stranded or in distress at any place on the shore of the sea, or of any tidal water, the receiver of wreck of the district is to proceed thither and take command, and issue such directions as he may think fit with a view to the preservation of the ship. All cargo and other articles washed ashore, or lost or taken from the ship, are to be delivered to the receiver. In the absence of the receiver, customs officers, justices of the peace, and others have the power of the receiver. The receiver is as soon as possible to examine on oath any person who may be able to

[1] [Also by the *Ctenolabrus cæruleus* (De Kay), or salt-water perch.—AM. ED.]

[2] Hamilton *v.* Davis, 5 Burrow's *Rep.*, 2733.

give any account of a ship in distress or her cargo or stores, and forward the result of his examination to the Board of Trade (where it is deposited in the wreck register) and to Lloyd's. On proof of title of a lord of a manor or other person entitled to unclaimed wreck, the receiver is to hold it on behalf of such person. The receiver is aided and protected by numerous provisions making it punishable to refuse men or vehicles on his demand, to secrete or fail to give notice of wreck, to obstruct the receiver or any other person on his way to the wreck, etc. In case of suspected concealment of wreck, he may obtain a search warrant (see WARRANT) from a justice of the peace. Whenever any wreck is saved by any person other than a receiver, SALVAGE (*q.v.*) is payable. In case of no claim being made within a year by the owner, and in the absence of any private right of a lord of a manor or other person, the receiver is to sell the wreck, and pay the proceeds, after deducting expenses and salvage, to the exchequer, to become part of the consolidated fund. The Admiralty Division of the High Court of Justice has jurisdiction to decide upon all claims of salvage, whether the wreck is found at sea or cast upon the land, or partly in the sea and partly on land. Wreck, if foreign goods, is liable to customs duties. Goods saved from a ship wrecked on its homeward voyage are to be forwarded to the port of its original destination. A seaman is entitled to wages up to the time of a vessel being wrecked, unless he has not exerted himself to the utmost to save the ship, cargo, and stores. Receivers' districts under the Act of 1854 were formed by a Board of Trade order of October 7, 1856. The Merchant Shipping Act, 1862, provides, *inter alia*, that the receiver may appoint a valuer in salvage cases, that the delivery of wreck by the receiver to any person is not to prejudice the right of third parties, and that the payment of proceeds of wreck claimed by the crown is to be made to the consolidated fund or the revenues of the duchies of Cornwall or Lancaster according to circumstances. Instructions to receivers were issued by the Board of Trade in 1865 and 1886. In 1876 a new tribunal for the investigation of shipping casualties was created by the Merchant Shipping Act, 1876, which has in most cases superseded the procedure provided by the Act of 1854. The Act enabled the lord chancellor to appoint a wreck commissioner, or wreck commissioners not exceeding three, and gave the commissioner or commissioners power to act with or without skilled assessors, and in certain cases which were not within the purview of the Act of 1854, viz., where a ship on the coast of the United Kingdom or a British ship elsewhere has been stranded or damaged and any witness is found at any place in the United Kingdom, and where a British ship has been lost or is supposed to have been lost, and any evidence can be obtained in the United Kingdom as to the circumstances under which she proceeded to sea or was last heard of. In addition to the Acts mentioned, there are several others which affect the subject of wreck more or less directly. By 6 Geo. IV. c. 87 consuls in foreign ports are to have credit for disbursements on behalf of shipwrecked persons. Where a foreign ship is wrecked, the consul-general or other consular officer is by 18 and 19 Vict. c. 91 to be deemed the owner. Removal of wrecks is provided for in dockyards by 28 and 29 Vict. c. 125, in most other cases by the Harbors Clauses Act, 1847, and the Removal of Wrecks Act, 1877, giving powers of removal to the harbor or general lighthouse authorities. Provision is made by special Acts for raising wreck in the Thames, Mersey, Humber, Clyde, and other rivers. Burial of bodies washed ashore from wrecks is regulated by 48 Geo. III. c. 75 and 49 Vict. c. 20. The criminal law relating to wreck has been the subject of a considerable mass of legislation. The protection of the receiver in his duties by the Act of 1854 has been already mentioned. The Act further provides against wrongfully carrying off or removing wreck, impeding or hindering the saving of wreck, and secreting wreck or obliterating or defacing any marks thereon. Taking wreck into a foreign port and there disposing of it is made felony, punishable with ten years' penal servitude. Other provisions are made by the criminal law Consolidation Acts of 1861. To plunder or steal any part of a wrecked ship or vessel, or any goods belonging to such vessel, is a felony, punishable with fourteen years' penal servitude. Any person in possession of such goods, and not giving a satisfactory account of how he came by them, may be committed to prison on summary conviction, and such goods, if exposed for sale, may be seized and carried before a justice of the peace, and the vendor called upon to satisfy the justice that he came lawfully by them, 24 and 25 Vict. c. 96, ss. 64–66. Destruction of and injury to ships or wrecks, and masking, alteration, or removal of lights or exhibition of false lights, and injury to or concealment of buoys and other marks of navigation, are all punishable by 24 and 25 Vict. c. 97, ss. 42–49, penal servitude for life being the maximum penalty. To impede a shipwrecked person or any person in his endeavor to save him, and to assault any magistrate, officer, or other person in the exercise of his duty in the preservation of wreck, are crimes by 24 and 25 Vict. c. 100, ss. 17, 37. In the case of plunder, damage, or destruction of any ship or boat stranded or in distress on the shore of the sea or tidal water, or of any part of its cargo or apparel, by persons riotously and tumultuously assembled, either ashore or afloat, the owner has a right to compensation against the police authority of the district under the Riot (Damages) Act, 1886.

Scotland.—As in England, unclaimed wreck was a right of the crown, often granted to subjects, generally under the style of "wrak, waith, and ware," the last two words signifying derelict and seaweed. It was so granted to the earl of Orkney in 1581. It was occasionally dealt with by the Scottish Parliament. Thus by 1426, c. 15, ships wrecked on the coast of Scotland were to be escheat to the king if they belonged to a country observing a similar law, otherwise to have the favor shown to ships of Scotland. Compensation for destruction of wreck by a riotous assembly is to be made by the inhabitants of the nearest county, city, or borough under the Riot Act of George I. (see RIOT), the Act of 1886 not applying to Scotland.

United States.—The State legislation as to disposition of wrecked property is generally in favor of the owner on his claim being made within a limited time. As to the Acts of Congress on the subject, the secretary of the treasury is empowered to make contracts and provisions for the preservation, sale, or collection of wrecked property, *Revised Statutes*, § 3755, and may issue a register for a foreign vessel wrecked in the United States and purchased and repaired by a citizen of the United States, § 4136. Special provisions are made as to wreck in Florida, §§ 4239–4241. Plundering wreck, or impeding the escape of a shipwrecked person, or showing false or extinguishing true lights in order to cause wreck are punishable offences, § 5358. Wreck is not confined as in England to loss on tidal waters, but extends to that happening on the great freshwater lakes and rivers. Wreck commissioners and wreck masters are generally appointed, with powers and duties similar to those of the receiver in the United Kingdom. (J. W†.)

WREN (Anglo-Saxon *Wrænna* and *Wrenne*, Icelandic *Rindill*), the well-known little brown bird—with its short tail, cocked on high—inquisitive and familiar, that braves the winter of the British Islands and even that of the European continent, and, except in the hardest of frosts, will daily sing its spirit-stirring strain. It is the *Motacilla* or *Sylvia troglodytes* of the earlier systematists, and the *Troglodytes parvulus*, *europæus*, or *vulgaris* of most later writers, save a few who (ignoring not only common sense but also the accepted rules of scientific nomenclature), by an utterly mistaken view of Vieillot's intention in establishing the genus *Troglodytes*, reserve that term for some American species—which can hardly be generically separated from the European form—and have attempted to fix on the latter the generic term *Anorthura*, which is its strict equivalent and was proposed by Rennie on grounds that are wholly inadmissible.

The interest taken in this bird throughout all European countries is scarcely exceeded by that taken in any other, and, though in Britain comparatively few vernacular names have been applied to it, two of them—"Jenny" or "Kitty-Wren"—are terms of endearment. M. Rolland records no fewer than 139 local names for it in France; and Italy, Germany, and other lands are only less prolific. Many of these carry on the old belief that the Wren was the King of Birds, a belief connected with the fable that on one occasion the fowls of the air in general assembly resolved to choose for their leader that one of them which should mount highest. This the eagle seemed to do, and all were ready to accept his rule, when a loud burst of song was heard, and perched upon him was seen the exultant Wren, which unseen and unfelt had been borne aloft by the giant. The curious association of this bird with the Feast of the Three Kings, on which day in South Wales, or, in Ireland and in the south of France, on or about Christmas Day, it was customary for men and boys to "hunt the Wren," addressing it in a song as "the King of Birds," is very remarkable, and has never yet been explained.

The Wren hardly needs description here, and its domed nest, apparently so needlessly large for the size of the bird, is a well-known object, for it is built with uncommon care, and often (though certainly not always) in such a fashion as to assimilate its exterior to its surroundings and so to escape observation. Very curious too is the equally un-

accountable fact, that near any occupied nest may generally be found another nest, or more than one, of imperfect construction. The widespread belief concerning these unfinished fabrics is implied by their common name of "cocks' nests," but evidence to that effect is not forthcoming. The breeding-habits of the Wren were most closely studied and accurately reported by Mr. Weir to Macgillivray (*Brit. Birds*, iii. pp. 23–30) in a way that leads every ornithologist to wish that the same care might be bestowed on other kinds of birds.

The range of the Wren in Europe[1] is very extensive, though it seems to stop short of the Arctic Circle; but it occurs in Algeria, Madeira, and, according to Bolle, in the Canaries. It also inhabits Palestine. Further to the eastward its limits are difficult to trace, because they inosculate with those of a considerable number of local races or species. As might be expected, the form inhabiting Japan, *T. fumigatus*, seems to be justifiably deemed a species. In North America, *T. alascensis* occurs in the extreme northwest, and is replaced further to the southward by *T. pacificus*. Eastward of the Rocky Mountains, the form is *T. hyemalis*—the well-known Winter-Wren of Canada and the United States. The number of species of Wrens inhabiting North America is, however, very considerable; but authorities are by no means agreed as to how many should be reckoned valid, and they have been segregated into six or seven genera. Here the House-Wren, *T. domesticus* or *aedon*, can alone be mentioned. It is a very common summer-visitant to most parts of the Eastern States, and where it occurs is of a very familiar disposition, entering into the closest relations with those that cultivate its acquaintance. It is represented in the West by *T. parkmanni*.

The *Troglodytidæ*, if they are to be regarded as forming a distinct Family, predominate in the New World, no fewer than 60 species being enumerated in the *Nomenclator* of Messrs. Sclater and Salvin as belonging to the Neotropical Region. But the *Troglodytidæ* by no means contain all the birds to which the name "Wren" is applied. Several of the *Sylviidæ* (*cf.* Warbler) bear it, especially the beautiful little Golden-crested Wren (*cf.* Kinglet) and the group commonly known in Britain as "Willow-Wrens"—forming the genus *Phylloscopus*. Three of these are habitual summer-visitants, which differ much more in their manners than in their look. The largest, usually called the Wood-Wren, *P. sibilatrix*, is more abundant in the north than in the south of England, and chiefly frequents woods of oak or beech. It has a loud and very peculiar song, like the word *twēē*, sounded very long, and repeated several times in succession—at first slowly, but afterwards more quickly, and near the end accompanied by a peculiar quivering of the wings, while at uncertain intervals comes another note, which has been syllabled as *chea*, uttered about three times in succession. The Willow-Wren proper, *P. trochilus*, is in many parts of Great Britain the commonest summer-bird, and is the most generally dispersed. In spring its joyous burst of song is repeated time after time until all around thrills with the loud and merry chorus, and yet never tires the ear. The restless but graceful activity of the bird, as it flits from twig to twig, adds to the charm of its appearance, which Hewitson so well appreciated. The third species, *P. collybita* or *minor* (frequently but most wrongly called *Sylvia rufa* or *P. rufus*), commonly known as the Chiffchaff, from the peculiarity of its constantly repeated two-noted cry, is very numerous in the southern and western part of England, but seems to be scarcer northward. These three species make their nest upon or very close to the ground, and the building is always domed. Hence they are commonly called "Oven-birds,"[2] and occasionally, from the grass used in their structure, "Hay-jacks," a name common to the White-Throat (*q.v.*) and its allies.

To return, however, to the *Troglodytidæ* or true Wrens. If it cannot be said that they form a peculiar Family, it would be rather to the *Sylviidæ* that they and the *Certhiidæ* (*cf.* Tree-Creeper) should be assigned, and they seem to be very unfitly placed among the *Timeliidæ*, as has lately been done (*Cat. B. Brit. Museum*, vi. p. 1). These last, so far as any definition can be given of them, belong to the Ethiopian and Indian Regions, while the predominance of the *Troglodytidæ* in the Neotropical Region, as already remarked, is very obvious. (A. N.)

WREN, Sir Christopher (1631–1723), the son of a clergyman, was born at East Knoyle, Wiltshire, in 1631; he entered at Wadham College, Oxford, in 1646, took his degree in 1650, and in 1653 was made a fellow of All Souls. While at Oxford Wren distinguished himself in geometry and applied mathematics;[3] in 1657 he became professor of astronomy at Gresham College, and in 1660 was elected Savilian professor of astronomy at Oxford. It is, however, as an architect that Wren is best known, and the great fire of London, by its destruction of the cathedral and nearly all the city churches, gave Wren a scope for his talent such as probably no architect has ever had to the same extent. Just before the fire Wren was asked by Charles II. to prepare a scheme for the restoration of the old St. Paul's. In May, 1666, Wren submitted his report and designs[4] for this work; the old cathedral was in a very ruinous state, and Wren proposed to remodel the greater part, as he said "after a good Roman manner," and not "to follow the Gothick Rudeness of the old Design." According to this scheme, only the old choir was left; the nave and transepts were to be rebuilt after the classical style, with a lofty dome at the crossing—not unlike the plan which was eventually carried out.

In September of the same year (1666) the fire occurred, and the old St. Paul's was completely gutted, though the greater part of its walls still remained standing. From 1668 to 1670 attempts were being made by the chapter to restore the ruined building; but Dean Sancroft was anxious to have the cathedral wholly rebuilt, and in 1668 he had asked Wren to prepare a design for a wholly new church. This first design, the model for which is preserved in the South Kensington Museum, is very inferior to what Wren afterwards devised. In plan it is an immense rotunda surrounded by a wide aisle, and approached by a double portico; the rotunda is covered with a dome taken from that of the Pantheon in Rome; on this a second dome stands, set on a lofty drum, and this second dome is crowned by a tall spire. This plan was devised as being specially suitable to the needs of a Protestant church, but the dean and chapter objected to the absence of a structural choir, nave, and aisles, and wished to follow the mediæval cathedral arrangement, at least as far as concerned the plan. Thus, in spite of its having been approved by the king, this design was happily abandoned—much to Wren's disgust; and he prepared another scheme with a similar treatment of a dome crowned by a spire, which in 1675 was ordered to be carried out. Wren had, however, been much hampered by ignorant interference, and apparently did not himself approve of this second design, for he got the king to give him permission to alter it as much as he liked, without showing models or drawings to any one. Wren fully availed himself of this permission, and the actual building bears little resemblance to the approved design, to which it is very

[1] Much interest has lately attached to the discovery, announced by Mr. Seebohm (*Zoologist*, 1884, p. 333) that the Wren, for 200 years and upwards, known to inhabit St. Kilda differed in hue from that of the other British Islands and that of the continent of Europe, and it has by him been described as a distinct species, *T. hirtensis*. It had for more than twenty years been known that the Wren of the Færoes and Iceland deserved separation from the ordinary *T. parvulus*, by being larger, and especially by having larger and stouter feet. It is the *T. borealis* of Fischer (*Journ. für Ornithologie*, 1861, p. 14, pl. i.).

[2] By ornithologists this name is given to a wholly distinct group—not even belonging to the *Oscines*—the *Furnariidæ* of Garrod, consisting of about 8 genera of Tracheophonine Birds, some of which build marvellous nests of mud spherical in form. For their habits see Darwin (*Jour. of Researches*, chap. v.) and Mr. Hudson's account (*Argentine Ornithology*, i. pp. 167–170).

[3] Newton, in his *Principia*, p. 19, ed. of 1713, speaks very highly of Wren's work as a geometrician.

[4] Wren's drawing for this exists in the All Souls collection.

superior in almost every possible point. Wren's earlier designs have the exterior of the church arranged with one order of columns; the division of the whole height into two orders was an immense gain in increasing the apparent scale of the whole, and makes the exterior of St. Paul's very superior to that of St. Peter's in Rome, which is utterly dwarfed by the colossal size of the columns and pilasters of its single order.[1] The present very graceful dome and the drum on which it stands, masterpieces of graceful line and harmonious proportion, were very important alterations from the earlier scheme. As a scientific engineer and practical architect Wren was perhaps more remarkable than as an artistic designer. The construction of the wooden external dome, and the support of the stone lantern by an inner cone of brickwork, quite independent of either the external or internal dome, are wonderful examples of Wren's constructive ingenuity. The first stone of the new St. Paul's was laid on June 21, 1675; the choir was opened for use December 2, 1697; and the last stone of the cathedral was set in 1710. The stone used is from the Portland quarries; the wooden dome is covered with lead, not copper, as was at first proposed. The fine oak stalls were carved by Grinling Gibbons, who received £1333, 7s. 5d. [$6814.21] for them. The whole cost of the cathedral was £1,167,474 [$5,961,137.52],—of which £810,181 [$4,136,784.19] was provided by the London import duty on coal.[2]

After the destruction of the city of London Wren was employed to make designs for rebuilding its fifty burnt churches, and he also prepared a scheme for laying out the whole city on a new plan, with a series of wide streets radiating from a central space. Difficulties arising from the various ownerships of the ground prevented the accomplishment of this scheme.

Among Wren's city churches the most noteworthy are St. Michael's, Cornhill; St. Bride's and St. Mary le Bow, Fleet Street, the latter remarkable for its graceful spire; and St. Stephen's, Walbrook, with a plain exterior, but very elaborate and graceful interior. In the design of spires Wren showed much taste and wonderful power of invention. He was also very judicious in the way in which he expended the limited money at his command; he did not fritter it away in an attempt to make the whole of a building remarkable, but devoted it chiefly to one part or feature, such as a spire or a rich scheme of internal decoration. Thus he was in some cases, as in that of St. James, Piccadilly, content to make the exterior of an almost barn-like plainness.

The other buildings designed by Wren were very numerous. Only a few of the principal ones can be mentioned: the custom house, the royal exchange, Marlborough House, Buckingham House, and the Hall of the College of Physicians—now destroyed; others which exist are—at Oxford, the Sheldonian theatre, the Ashmolean museum, the Tom Tower of Christ Church, and Queen's College chapel; at Cambridge, the library of Trinity College and the chapel of Pembroke, the latter at the cost of Bishop Matthew Wren, his uncle. The western towers of Westminster Abbey are usually attributed to Wren, but they were not carried out till 1735–45, many years after Wren's death, and there is no reason to think that his design was used. Wren (D.C.L. from 1660) was knighted in 1673, and was elected president of the Royal Society in 1681.[3] He was in parliament for many years, representing Plympton from 1685, Windsor from 1689, and Weymouth from 1700. He occupied the post of surveyor of the royal works for fifty years, but by a shameful cabal was dismissed from this office a few years before his death. He died in 1723, and is buried under the choir of St. Paul's; on a tablet over the inner north doorway is the well-known epitaph—"Si monumentum requiris, circumspice."

Wren's genius as an artist is very difficult to estimate; he lived at a most unhappy time, when architecture had sunk almost to its lowest point of degradation. If, however, we bear this in mind we must admit that he was an artist of very remarkable ability; his inventive genius no one can dispute.

For further information the reader should consult the *Parentalia*, published by Wren's grandson in 1750, an account of the Wren family and especially of Sir Christopher and his works; also the two biographies of Wren by Elmes and Miss Phillimore; Milman, *Annals of St. Paul's*, 1868; and Longman, *Three Cathedrals dedicated to St. Paul in London*, 1873, pp. 77 *sq.* See also Clayton, *Churches of Sir C. Wren*, 1848–49; Taylor, *Towers and Steeples of Wren*, London, 1881; and Niven, *City Churches*, London, 1887, illustrated with fine etchings. In the library of All Souls at Oxford are preserved a large number of drawings by Wren, including the designs for almost all his chief works, and a fine series showing his various schemes for St. Paul's Cathedral.

(J. H. M.)

WRESTLING AND BOXING. Wrestling is the art of forcing an antagonist to the ground without resorting to blows or kicks. It is a trial of strength and skill between two opponents standing face to face, who strive to throw one another. As a gymnastic exercise it was greatly encouraged among the ancient Greeks, and the highest honors and rewards were bestowed on the victors at the Olympic, Isthmian, Nemean, and other games (see GAMES). It was also cultivated by the Romans, though their tastes inclined to more savage and brutalizing exhibitions than that of wrestling. It was not unknown in Egypt and at Nineveh, as may be seen from the sculptures in the British Museum. At the same time it differed very much in its ancient form from the wrestling of to-day, the wrestlers of old being wont to compete almost if not quite nude, their bodies besmeared with oil or some other kind of grease by way of making their muscles supple; but, as this practice rendered it very difficult to get fair hold of one another, the wrestlers were accustomed to use sand on their hands, or even to roll in the dust of the arena as a corrective. In their contests they took hold of each other by the arms, drew forward, pushed backward, used many contortions of the body, interlocked their limbs, seized one another by the neck, throttled, lifted each other off the ground, and butted like rams, though the chief point of their art was to become master of their opponents' legs, when a fall was the immediate result. In England the pastime has been popular from an early period, more especially in the Middle Ages, for in 1222, in Henry III.'s reign, it is on record that a wrestling match took place between the men of Westminster and the citizens of London in St. Giles Fields, the latter winning easily. The return match was held at Westminster on Lammas day following, but was interrupted by the bailiff of Westminster and his associates, who maltreated the Londoners and drove them into the city. At a later period Clerkenwell was the usual trysting place. At one of the matches there in 1453 another riot occurred, and the lord mayor, who usually attended these athletic carnivals, was again routed and driven within the city boundary. In those days the prize was sometimes a ram and sometimes a cock.

The four English systems of wrestling include those of (1) Cornwall and Devon, (2) Lancashire, (3) Catch hold, first down to lose, and (4) Cumberland and Westmorland. The Cornwall and Devon men com-

[1] Proportionally the apparently greater size of St. Paul's is very remarkable; it is very difficult to realize that the top of the dome of St. Paul's is only as high as the springing of that of St. Peter's. In actual fact the one looks about as high as the other.

[2] Wren also designed a colonnade to enclose a large piazza forming a clear space round the church, somewhat after the fashion of Bernini's colonnade in front of St. Peter's, but space in the city was too valuable to admit of this. Wren was an enthusiastic admirer of Bernini's designs, and visited Paris in 1665 in order to see him and his proposed scheme for the rebuilding of the Louvre. Bernini showed his design to Wren, but would not let him copy it, though, as he said, he "would have given his skin" to be allowed to do so.

[3] The Royal Society possesses a good portrait of Wren by Kneller.

pete in strong loose linen jackets, catching hold above the waist or of any portion of the jacket. Kicking, which used to be a prominent feature of the west-country style, is now forbidden, and the men wrestle in their stockinged feet. In order to be fairly thrown, two shoulders and one hip must be on the ground, or two hips and one shoulder, and a man must be thrown flat on his back before any other portion of his body touches the earth ere a decision can be given against him. Formerly each county wrestled under different rules, but the systems are now amalgamated and are classed as one and the same. In Lancashire the wrestlers compete in their stockinged feet, but are allowed to catch hold of any portion of the body. This is the most barbarous of all the English systems, and includes the objectionable battling on the ground which is the fatal characteristic of the French method. Tripping, however, is not forbidden, and a fall is sometimes secured without a resort to scrambling tactics, which is impossible under French rules. The "catch hold, first down to lose" style of wrestling is of recent origin and promises to become popular. The utmost simplicity distinguishes it. Ordinary wrestling attire is worn, such as jersey, drawers or knickerbockers, and stockings. The men on closing must not grip lower than the waist, and the competitor who touches the ground first by any part of his body is the loser. This system is perhaps the fairest for all parties, as the competitors set to work on equal terms without that delay in getting into holds so frequent in north-country wrestling. The Cumberland and Westmorland system is probably the best and most scientific of all. On taking hold, the wrestlers stand up chest to chest, each placing his chin on his opponent's right shoulder and grasping him round the body, the right arm of each being under the left arm of the other, and each joins his hands behind his opponent. When both have got hold the play commences. Kicking is forbidden, and if one competitor lets go his hold before the other the decision is given against him. If both fall on the ground—an undecided or dog-fall, as it is termed—they wrestle over again, but if one falls before the other his defeat is registered at once. This kind of wrestling is free from danger, and the German style much resembles it, but in the latter a competitor's hands are not required to remain locked behind his adversary's back, as is the practice in the north of England. No catching hold of legs, thighs, or arms is allowed, but each man tries to throw his adversary by using the "buttock," which consists of facing to the right, twisting so as to place the left hip under an opponent's middle, pulling him close, stooping forwards and lifting him off the ground, and throwing him; or the "cross-buttock," facing to the right about to such an extent as to turn the back to the adversary, and then proceeding as before; or the "back-hank," which consists in commencing as in the "buttock," and then passing the left leg from inside round an antagonist's left leg, when by keeping a tight hold with the arms and pulling backwards the leverage supplied by the leg being inside usually secures the fall; or the "back heel," which consists in pulling an opponent towards one, putting the left heel behind his right heel, forcing his leg up forwards, and throwing him bodily backwards; or the "left leg hipe," which consists in lifting and swinging him round to the right, then striking the inside of his right thigh with the outside of the left thigh, by which he gets off his balance and falls; the "right leg hipe" is the same action *mutatis mutandis*. There is also the "left leg stroke," which consists in striking an antagonist's right leg with one's left leg, swinging him round to the left and off his balance; the "right leg stroke" is the same thing with the right leg. Of course there is an umpire to see that no competitor takes an unfair advantage or plays foul, and to determine disputed points according to the rules in force.

Boxing.—This, though perhaps hardly as popular as wrestling, is closely identified with it in the gymnasium, if not outside it. In the United Kingdom prize fighting is an illegal sport, but it is hardly likely that glove boxing will ever fall into the same disrepute. Its present comparative popularity is principally due to the efforts of the late Mr. John G. Chambers, who in 1866 founded the Amateur Athletic Club, and in conjunction with the marquis of Queensberry drew up a code of rules (known as the Queensberry rules), which regulate the principal glove contests throughout the kingdom, as follows:

Challenge Cups (Open to Gentlemen Amateurs).—1. That the entries be drawn to contend by lots. 2. That the entrance fee be 10s. 3. Heavy weights to be over 11 stone 4 lb; middle weights not to exceed 11 stone 4 lb; light weights not to exceed 10 stone. 4. That there be three judges appointed by the committee. 5. That the boxing take place in a 24 feet ring. 6. That no wrestling, roughing, or hugging on the ropes be allowed. 7. That each heat consist of three rounds, with one minute interval between; the duration of each round to be at the discretion of the judges, but not to exceed five minutes. 8. Any competitor not coming up to time shall be deemed to have lost. 9. That no shoes or boots with spikes or sprigs be allowed. 10. Competitors to wear jerseys. 11. Gloves to be provided by the club. 12. The cups to be boxed for once in each year; the winner to receive a silver medal.

Definition of Gentleman Amateur.—Any gentleman who has never competed in an open competition, or for public money, or for admission money, or with professionals for a prize, public money, or admission money, and who has never at any period of his life taught, pursued, or assisted in the pursuit of athletic exercises as a means of livelihood. The committee reserve the right of requiring a reference or of refusing an entry.

Contests for Endurance.—To be a fair stand-up boxing match, in a 24 feet ring, or as near that size as practicable; no wrestling or hugging allowed; the rounds to be of three minutes' duration and one minute time; if either man fall through weakness or otherwise he must get up unassisted; ten seconds to be allowed him to do so; the other man meanwhile to retire to his corner, and when the fallen man is on his legs the round is to be resumed and continued until the three minutes have expired, and, if one man fails to come to the scratch in the ten seconds allowed, it shall be in the power of the referee to give his award in favor of the other man; a man hanging on the ropes in a helpless state, with his toes off the ground, shall be considered down; no seconds or any other person to be allowed in the ring during the rounds; should the contest be stopped by any unavoidable interference, the referee to name time and place for finishing the contest as soon as possible, so that the match must be won or lost, unless the backers of both men agree to draw the stakes. The gloves to be fair-sized boxing gloves of the best quality, and new; should a glove burst or come off, it must be replaced to the referee's satisfaction. A man on one knee is considered down, and if struck is entitled to the stakes. No shoes or boots with sprigs allowed. (E. D. B.)

WREXHAM, a market-town and municipal and parliamentary borough of Denbighshire, North Wales, 11 miles south-southwest of Chester and 201 miles from London by rail. It was characterized by the poet Churchyard in the 16th century as "Trim Wricksam towne, a pearle of Denbighshiere," and the description is not altogether inapplicable at the present day, the streets being spacious, with many handsome houses. Wrexham church, dedicated to St. Giles, contains 14th and 15th century work, but was in great part reconstructed at the beginning of the 16th century. The tower, erected between 1506 and 1520, has been styled "one of the seven wonders of Wales." It is 135 feet in height, and consists of several successive stages panelled throughout, and decorated with numerous statues of saints placed in niches of the buttresses. It is surmounted by an open-work balustrade, from which spring four lantern-shaped turrets of pierced open-work. The church was restored in 1867. It contains a large number of monuments. The bells, ten in number, are the most famous in the principality. In 1647 the church was used as a prison by Cromwell. The other principal public buildings are the guild-hall (formerly the old grammar school); the public and

corn exchange (formerly the Union Hall), opened in 1873, after alteration, at a cost of £4900 [$23,814]; the infirmary; and the infantry barracks of the Royal Welsh Fusiliers. In the neighborhood there are a race-course and training-ground. The town is situated on the edge of the Denbighshire coalfield, in the vicinity of coal, iron, and lead mines. It has long been celebrated for its ales, and possesses also corn and paper mills and tanneries. The surrounding country is very fertile, and the agricultural trade is of some importance. The parliamentary borough unites with Denbigh, Ruthin, and Holt in returning a member to parliament. The town has a special commission of the peace and a petty sessions court. The population of the municipal borough and urban sanitary district (1306 acres) was 8576 in 1871, and 10,978 in 1881. The population of the parliamentary borough (1791 acres) in 1881 was 12,333.

Although Wrexham was situated on the eastern side of Offa's Dyke, it was reckoned one of the towns of Mercia. In the Saxon Chronicle the name occurs as Wrightesham. Edward I. granted the town with the lordship of Bromfield and Yale to John Earl Warren. The township of Wrexham Regis within the borough and the township of Stansty without constitute ancient manors. Formerly the township of Wrexham Abbot was ecclesiastical property, and an appendage to the abbey of Valle Crucis, near Llangollen. During the civil war the town was occupied by the Parliamentary troops. Wrexham town was constituted a parliamentary borough in 1832, and incorporated as a municipal borough in 1857.

See A. N. Palmér's *Wrexham* and *History of the Parish Church of Wrexham*.

WRIGHT, Joseph (1734–1797), styled Wright of Derby, subject, landscape, and portrait painter, was born at Derby on September 3, 1734, the son of an attorney of the place, who was afterwards town-clerk. During his early years he manifested an aptitude for mechanical pursuits, and also for music, but he finally resolved to become a painter, and in 1751 he went to London and for two years studied under Thomas Hudson, the master of Reynolds. Returning to Derby he practiced portrait-painting; but feeling the need for further instruction he again placed himself for fifteen months under his former master. He then settled in Derby, and varied his work in portraiture by the productions of the subjects seen under artificial light with which his name is chiefly associated, and by landscape painting. He married in 1773, and in the end of that year he visited Italy, where he remained till 1775. While at Naples he witnessed an eruption of Vesuvius, which under various treatment formed the subject of many of his subsequent pictures. On his return from Italy he established himself at Bath as a portrait painter; but meeting with little encouragement he returned to Derby, where he spent the rest of his life. He was a frequent contributor to the exhibitions of the Society of Artists, and to those of the Royal Academy, of which he was elected an associate in 1781 and a full member in 1784. He, however, declined the latter honor on account of a slight which he believed that he had received, and severed his official connection with the Academy, though he continued to contribute to the exhibitions from 1783 till 1794. He died at Derby on August 29, 1797.

There has been a tendency in recent criticism to overestimate the works of Joseph Wright. His portraits are frequently defective in drawing, and without quality or variety of handling, while their flesh tints are often hard and unpleasant in their purple-gray shadows. He is seen at his best in his subjects of artificial light, of which the Orrery (1766), the property of the corporation of Derby, and the Air-pump (1768), in the National Gallery, are excellent examples. His Old Man and Death (1774) is also a striking and individual production. An exhibition of Wright's works was brought together at Derby in 1883, and twelve of his pictures were shown in the winter exhibition of the Royal Academy in 1886. A careful and elaborate biography of the artist, by William Bemrose, was published in 1885.

WRIGHT, Silas (1795–1847), was born at Amherst, Massachusetts, May 24, 1795. He graduated at Middlebury College, Vermont, in 1815, was admitted to the bar in 1819, and began practice at Canton, in northern New York. From the first he showed those characteristics which finally made him a representative American Democratic leader. He had settled in what was almost a wilderness. His farm was a small one, and no hired laborer upon it worked harder than he. His manner of life was of the simplest. In his professional work he was a type of the lawyer of the old school,—shrewd, skilful, rigidly just, and controlled by the belief that his profession was a public trust, and that judicial qualities must mingle with those of the advocate. He seems never to have sought an office, and never to have felt at liberty to refuse one, even that of village postmaster, if he could possibly serve. He was appointed surrogate in 1820, and was elected successively to the State senate in 1823, to the house of representatives in 1827–29, comptroller of the State 1829–33, United States senator 1833–44, and governor of New York 1844–46. During his public life he had become a leader of the Democratic party of New York, Van Buren being his closest associate. When the national Democratic party in 1844 nominated and elected Polk to the presidency, instead of Van Buren, Wright and the State organization took an attitude of armed neutrality towards the new administration. Renominated for governor in 1846, Wright was defeated, and the result was ascribed to the hostility of the Polk administration. The death of the defeated candidate, at Canton, August 27, 1847, gave intense bitterness to New York politics for several years; and his faction, in 1848, succeeded in defeating their national party's candidates in the presidential election.

Wright was one of a class of politicians which has influenced American development largely, finding its most characteristic types in the State of New York. It may be traced clearly from about 1820, beginning with what was then known as "the Albany Regency," including Dix, Marcy, Wright, Seymour, Tilden,[1] to Cleveland (president from 1885), and many of the new men who have come into the national administration with him. Absolutely and punctiliously honest, devoted to the public good, and believing intensely that the public good depended on the political principles of their party, they have been prone to consider politics as a warfare, and merciless exclusion of opponents from office as a legitimate war-weapon. One of their earliest leaders, Marcy, declared the rule of party struggle, that "the spoils (of office) belong to the victor"; the latest, President Cleveland, has been the first[2] to recognize the merit system of appointment in practice, Tilden having already accepted it in theory. The sternness of Wright's integrity in office was illustrated in 1845, when the "anti-rent troubles" broke out again, and it seemed probable that the votes of the disaffected would decide the coming election. The governor asked and obtained from the legislature the power to suppress the disturbance by armed force, ordered the militia into the disturbed district, arrested the offenders, had them tried, convicted, and punished, and put an end to what was really an insurrection. His defeat in 1846 was a transition from the old to the new phase of American politics; but his name is still the representative of all that was best in the old.[3]

Wright's *Life* has been written by Jenkins, who also has a sketch of him in his *Governors of New York;* but the best biography of him is that of Hammond.

WRIGHT, Thomas (1810–1877), antiquary, was born at Ludlow, in Shropshire, 21st April, 1810, and

[1] [The Albany regency virtually was bound up with Van Buren's fortunes, and ceased with his adherence to the Free-Soil party.—Am. Ed.]

[2] [For Civil Service reform see volume xxvi. Mr. Cleveland's adhesion to its principles in administration is a matter of opinion.—Am. Ed.]

[3] [Wright was descended from Samuel who emigrated from England in 1630. In 1827 he was a brigadier-general in the New York State militia, and took an active part in politics as an anti-Clinton Democrat. In Congress he was a Republican or "bucktail" and acted with the Democratic party in supporting the administrations of Jackson and Van Buren. A consistent opposer of the extension of slavery and Congressional interference with it, he could not approve the administration of Polk or the measures of the growing anti-slavery party. He favored the tariff of 1842 and opposed the annexation of Texas. His term as governor was disturbed by factions of his party and by anti-rent resistance to legal processes. The former he could not harmonize, but he suppressed the lawlessness of the anti-renters.—Am. Ed.]

was descended from a Quaker family formerly living at Bradford, in Yorkshire. He was educated at the old grammar school at Ludlow, and afterwards at Trinity College, Cambridge, where he graduated in 1834. While at Cambridge he contributed to the *Gentleman's Magazine* and other periodicals, and in 1835 he came to London to devote himself to a literary career. His first separate work was *Early English Poetry in Black Letter, with Prefaces and Notes*, 1836, 4 vols. 12mo, which was followed during the next forty years by a very extensive series of publications, many of lasting value. He helped to found the British Archæological Association and the Percy, Camden, and Shakespeare societies. In 1842 he was elected corresponding member of the Académie des Inscriptions et Belles Lettres of Paris, and was a fellow of the Society of Antiquaries as well as member of many other learned British and foreign bodies. In 1859 he superintended the excavations of the Roman city of Uriconium, near Shrewsbury, of which he issued a description. He died at Chelsea, 23d December, 1877, in his sixty-seventh year. A portrait of him is in the *Drawing Room Portrait Gallery* for October 1, 1859. His fertility was remarkable, and the list of seventy-eight articles in Allibone's *Dictionary* (1871, iii. pp. 2864–67) includes examples of almost every department of literature. He was a great scholar, but will be chiefly remembered as an industrious antiquary and the editor of many relics of the Middle Ages. In the British Museum catalogue are 121 references under his name.

His chief publications are—*Queen Elizabeth and Her Times, a Series of Original Letters*, 1838, 2 vols,; *Reliquiæ Antiquæ*, 1839–43, again 1845, 2 vols., edited with Mr. J. O. Halliwell-Phillipps; W. Mapes's *Latin Poems*, 1841, 4to, Camden Society; *Political Ballads* and *Carols*, published by the Percy Society, 1841; *Popular Treatises on Science*, 1841; *History of Ludlow*, 1841, etc., again 1852; *Collection of Latin Stories*, 1842, Percy Society; *The Vision and Creed of Piers Ploughman*, 1842, 2 vols., 2d ed. 1855; *Biographia Literaria*, vol. i., Anglo-Saxon Period, 1842, vol. ii., Anglo-Norman Period, 1846; *The Chester Plays*, 1843–47, 2 vols., Shakespeare Society; *St. Patrick's Purgatory*, 1844; *Anecdota Literaria*, 1844; *Archæological Album*, 1845, 4to; *Essays connected with England in the Middle Ages*, 1846, 2 vols.; Chaucer's *Canterbury Tales*, 1847–51, Percy Society, a new text with notes, reprinted in 1 vol., 1853 and 1867; *Early Travels in Palestine*, 1848, Bohn's Antiq. Lib.; *England under the House of Hanover*, 1848, 2 vols., several editions, reproduced in 1868 as *Caricature History of the Georges;* Mapes, *De Nugis Curialium*, 1850, 4to, Camden Society; Geoffrey Gaimar's *Metrical Chronicle*, 1850, Caxton Society; *Narratives of Sorcery and Magic*, 1851, 2 vols.; *The Celt, the Roman, and the Saxon*, 1852, 4th ed. 1885; *History of Fulke Fitz Warine*, 1855; Jo. de Garlandia, *De Triumphis Ecclesiæ*, 1856, 4to, Roxburghe Club; *Dictionary of Obsolete and Provincial English*, 1857; *A Volume of Vocabularies*, 1857, 2d ed. by R. P. Wülcker, 1884, 2 vols.; *Les Cent Nouvelles Nouvelles*, Paris, 1858, 2 vols.; Malory's *History of King Arthur*, 1858, 2 vols., revised 1865; *Political Poems and Songs from Edward III. to Richard III.*, 1859–61, 2 vols., Rolls Series; *Songs and Ballads of the Reign of Philip and Mary*, 1860, 4to, Roxburghe Club; *Essays on Archæological Subjects*, 1861, 2 vols.; *Domestic Manners and Sentiments in England in the Middle Ages*, 1862, 4to, reproduced in 1871 as *The Homes of other Days; Roll of Arms of Edward I.*, 1864, 4to; *Autobiography of Thomas Wright* (1736–97), his grandfather, 1864; *History of Caricature*, 1865, 4to; *Womankind in Western Europe*, 1869, 4to; *Anglo-Latin Satirical Poets of 12th Cent.*, 1872, 2 vols., Rolls Series.

WRIT, in law, is a formal commission from the crown or other supreme executive officer to an inferior executive officer or to a private person, enjoining some act or omission. The word represents the Latin *brevis* or *breve* (both forms are found, the latter more commonly), so called, according to Bracton, from its shortly expressing the intention of the framer, "quia breviter et paucis verbis intentionem proferentis exponit."[1] The *breve* can be traced back as far as the *Codex Theodosianus* (438 A.D.), where one of its meanings is that of an official report or letter. It bears a similar meaning in some of the capitularies of the Frankish kings. The *interdictum* of Roman law sometimes represents the writ of English law; *e.g.*, there is considerable likeness between the Roman *interdictum de libero homine exhibendo* and the English writs of *habeas corpus* and *de homine replegiando*. From Roman law the *breve* passed into the *Liber Feudorum* and the canon law, in both in a sense differing from that at present borne by the writ of English law. The *breve testatum* of the *Liber Feudorum* was an instrument in writing made on the land at the time of giving seisin by the lord to the tenant, and attested by the seals of the lord and the *pares curiæ* or other witnesses. In England such witnesses were part of the inquest, and joined in the verdict in case of disputed right until 12 Edw. II. st. 1, c. 2. The *breve testatum* in England developed into the FEOFFMENT (*q.v.*), later into the deed of grant (see REAL ESTATE); in Scotland into the charter, and later into the disposition. In canon law *breve* denoted a letter under the pope's seal. In old English ecclesiastical law a brief meant letters patent issued out of Chancery to churchwardens or other officers for the collection of money for church purposes. Such briefs were regulated by 4 Anne c. 14, but are now obsolete, although they are still to be found named in one of the rubrics in the communion service of the Book of Common Prayer. In English legal practice brief now denotes the written instructions put into the hands of counsel to form the basis of his case. It was probably so called from its at first being only a copy of the original writ. Such a brief is in Scotland called a memorial.

History of writ in English law.

The writ in English law still occupies a very important position, which can scarcely be understood without a sketch of its history. To a certain extent this history has already been given under PLEADING, for the whole theory of pleading depends in the last resort upon the writ. Writ or *breve* was at first used in a less technical sense than that which it afterwards assumed: thus in the *Leges Henrici Primi* it simply means a letter from the king, and in the Assize of Clarendon (1166) *imbreviari* means to be registered. It became formalized by the reign of Henry II., and precedents are given by Glanvill. The writ process was at that date the foundation of all civil justice in the king's court, and of much in the lower courts, and was a profitable source of revenue to the exchequer. Every writ had to be purchased (*breve perquirere* was the technical term). This purchase developed in later times into the payment of a fine to the king where the damages were laid above £40 [$533.33.] The usual scale was 6s. 8d. [$4.44] for every 100 marks [$666.67] claimed. In suing out a writ of covenant, the basis of the proceedings in levying a fine (see ENTAIL), the king was entitled to his *primer fine*, *i.e.*, one-tenth of the annual value of the land concerned. The sale of writs was forbidden by Magna Charta and other statutes in certain cases, especially that of the writ *de odio et atia* in favor of the liberty of the subject. A solicitor was so called because his original duty was to solicit or sue out a writ and take the due proceedings by paying the proper fine. The costs of a writ purchased were first allowed to a successful demandant by the Statute of Gloucester, 6 Edw. I. c. 1. Through the Norman period the prerogative of issuing writs seems to have been undisputed. Glanvill's precedents did not exhaust all possible forms, for in the time of Bracton, in the 13th century, it was still possible to frame new writs at the pleasure of the crown. The Provisions of Oxford in 1258 put an end to this by enacting that the chancellor should not seal anything out of course (*i.e.*, any writ for which there was no precedent) by the will of the king, but that he should do it by the council. In 1285 the Statute of Westminster the Second, 13 Edw. I. st. 1, c. 24, re-established the power of the crown within certain limits, that is, in

[1] It is perhaps doubtful whether *intentio* is here used in its ordinary sense or in the technical signification which it bore as a part of the Roman *formula* (see ROMAN LAW, vol. xx. p. 726).

causes of action in a similar case falling under the same law (*in consimili casu cadente sub eodem jure*) as those for which precedents of writs already existed in the Chancery (see TRESPASS, TROVER). These precedents were at an early date recorded in the *Registrum Brevium*, called by Sir Edward Coke the oldest book in the common law. Apart from the powers given by the statute, new writs could only be issued by the authority of parliament, and writs are sometimes found set out in statutes, especially in the *Statutum Walliæ*, 12 Edw. I. c. 7, where precedents of the most usual writs will be found. The Statute of Westminster the Second itself contained precedents of the writ of formedon and of many others. The original flexibility of the writ was thus limited within comparatively narrow bounds. The right to the issue of the writ determined the right of action. So essential was the writ that it was a legal axiom in Bracton that no one could sue at law without a writ, and it was called by Coke, in his introduction to Littleton, "the heartstrings of the common law." As such it occupied an important place in some of the leading statutes dealing with constitutional rights. The Statute of Marlbridge, 52 Hen. III. c. 22, forbade a lord to distrain his freeholders to answer for their freeholds, or for anything touching their freeholds, without the king's writ. By 25 Edw. III. st. 5, c. 4, it was accorded, asserted, and established that none should be taken by petition or suggestion made to the king or his council unless by indictment or presentment in due manner or by process made by writ original at the common law. 42 Edw. III. c. 3 provided that no man should be put to answer without presentment before justices, or matter of record, or by due process and writ original according to the old law of the land. Both these statutes were recited and the general principle confirmed by 16 Car. I. c. 10. Uniformity of procedure was secured by 27 Hen. VIII. c. 24, by which all writs were to be in the king's name in a county palatine or liberty, but tested by those who had the county palatine or liberty. It was not until 1731 that, by virtue of 4 Geo. II. c. 26, writs were framed in the English language. They had previously been in Latin; this accounts for the Latin names by which a large number are still known. The writ was issued from the common law side of the Chancery, and was in the special charge of the manager and petty bag offices. Though issuing from the king's Chancery, it did not necessarily direct the trial of the question in the king's court. In whatever court it was returnable it called in the aid of the sheriff as executive officer. It was either addressed to him or, if addressed to the party alleged to be in default, it concluded with a threat of constraint by the sheriff in the event of disobedience, generally in those terms, "et, nisi feceris, vicecomes de N. faciat ne amplius clamorem audiam pro defectu justitiæ." If the writ was returnable in the county court or the lord's court, the sheriff or the lord sat as the deputy of the king, not by virtue of his inherent jurisdiction. The writ was not necessary for the initiation of proceedings in these courts or before the justices in eyre (who sat as judges of the county court),[1] but a custom seems to have grown up of suing out a writ from the king where the claim was above 40s. Cases were transferred from the lord's court to the county court by writ of *tolt* (so called because it removed, *tollit*, the case), from the latter to the king's court by writ of *pone* (so called from its first word). By Magna Charta the power of bringing a suit in the king's court in the first instance by writ of *præcipe* was taken away, and the writ was thenceforth only returnable in the king's court where the tenant held of the king *in capite*, or where the lord had no court or abandoned his right. Hence it became a common form in the writ of right to allege that the lord had renounced his court (*dominus remisit curiam*) so as to secure trial in the king's court. Besides being used for the trial of disputes, writs addressed to sheriffs, mayors, commissioners, or others were in constant use for financial and political purposes, *e.g.*, for the collection of fifteenths, scutage, tallage, etc., for summons to the council and later to parliament, and for recalling a parliament, the last by means of the rarely occurring writ *de revocatione parliamenti*.

There were several divisions of writs (excluding those purely financial and political), the most important being that into original and judicial, the former (tested in the name of the king) issued to bring a suit before the proper court, the latter (tested in the name of a judge) issued during the progress of a suit or to enforce judgment. Original were either optional, *i.e.*, giving an option of doing a certain act or of showing cause why it was not done, beginning with the words *præcipe quod reddat*, the principal example being the writ on which proceedings in a common recovery (see ENTAIL) were based, or peremptory, *i.e.*, calling on a person to do a certain act, beginning with the words *si A fecerit te securum*. Original were also either *de cursu* or *magistralia*, the former those fixed in form and depending on precedent, the latter those framed by the masters in Chancery under the powers of the Statute of Westminster the Second. They were also either general or special, the latter setting forth the grounds of the demand with greater particularity than the former. By 5 Geo. II. c. 27 special writs were confined to causes of action amounting to £10 [$49] or upwards. There was also a division of writs into writs of right (*ex debito justitiæ*), such as *habeas corpus*, and prerogative writs (*ex gratia*), such as *mandamus* (see PREROGATIVE). Coke and other authorities mention numerous other divisions, but those which have been named appear to be the principal.

The most interesting form of writ from the historical point of view was the writ of right (*breve de recto*) called by Blackstone "the highest writ in the law," used at first for debt and other personal claims, afterwards confined to the recovery of real estate as the writ of right *par excellence*. It was so called from the words *plenum rectum* contained in it, and was the remedy for obtaining justice for ouster from or privation of the freehold. By it property as well as possession could be recovered. It generally lay in the king's court, as has been said, by virtue of a fictitious allegation. In that case it was addressed to the sheriff and was called a writ of right close. It was also a writ of right close where the lands in dispute were held in ancient demesne. When addressed to the lord and tried in his court, it was generally a writ of right patent. After the appearance of the tenant the demandant in a writ of right counted, that is, claimed against the tenant according to the writ, but in more precise terms, the writ being as it were the embryo of the future count. The trial was originally by battle (see TRIAL) but, in the reign of Henry II. an alternative procedure was introduced, interesting as the earliest example of the substitution of something like the JURY (*q.v.*) system for the judicial combat. A writ *de magna assisa eligenda* was directed to the sheriff commanding him to return four knights of the county and vicinage to the court, there to return twelve other knights of the vicinage to try upon oath the question contained in the writ of right (technically called the *mise*). This mode of trial was known as trial by the grand assize. Generally the whole of the sixteen knights were sworn, though twelve was a sufficient number. The last occasion of trial by the grand assize was in 1835. But long before that date possessory had from their greater convenience tended to supersede proprietary remedies, and in most cases the title was sufficiently determined by the assizes of other kinds, especially that of novel disseisin and later by proceedings in ejectment (see POSSESSION). The oath of the champion on proceedings in a

[1] The distinction between the royal and local courts was not perhaps at all times very strictly drawn. Thus in the *Leges Henrici Primi*, c. 31, the county court is called *curia regis*.

writ of right where the alternative of the judicial combat was accepted was regulated by statute 3 Edw. I. c. 41. The writ of right is also interesting as being the basis of the law of LIMITATION (*q.v.*). By the Statute of Merton, 20 Hen. III. c. 8, no seisin could be alleged by the demandant but from the time of Henry II. By 3 Edw. I. c. 39 the time was fixed at the reign of Richard I., by 32 Hen. VIII. c. 2 at sixty years at the most. There were other writs of right with special names, *e.g.*, the writ of right by the custom of London for land in London, the writ of right of advowson, brought by the patron to recover his right of presentation to a benefice, and the writs of right of dower and *de rationabili parte*, the latter brought by coparceners or brothers in gavelkind. There were also writs in the nature of a writ of right, *e.g.*, formedon, brought by a reversioner on discontinuance by a tenant in tail and given by the Statute *De Donis* (see ENTAIL); escheat, brought by the lord where the tenant died without an heir; *ne injuste vexes*, to prohibit the lord from exacting services or rents beyond his due; *de nativo habendo*, to recover the inheritance in a villein; and the little writ of right close according to the custom of the manor, to try in the lord's court the right of the king's tenants in ancient demesne.

Up to 1832 an action was (except as against certain privileged persons, such as attorneys) commenced by original writ, and writ practically became the equivalent of action, and is so used in old books of practice such as Booth on *Real Actions*. The law was gradually altered by legislation and still more by the introduction of fictitious proceedings in the common law courts, to be described later, by which the issue of the original writ was suspended, except in real actions, which were of comparatively rare occurrence. The original writ is no longer in use in civil procedure, an action being now in all cases commenced by the writ of summons, a judicial writ, a procedure first introduced in 1832 by 2 Will. IV. c. 39. In the following year an immense number of the old writs were abolished by 3 and 4 Will. IV. c. 27. An exception was made in favor of the writ of right of dower, writ of dower *unde nihil habet*, QUARE IMPEDIT (*q.v.*), and EJECTMENT (*q.v.*), and of the plaints for free bench and dower in the nature of writs of right. Ejectment was remodelled by the Common Law Procedure Act, 1852; the other writs and plaints remained up to the Common Law Procedure Act, 1860, by which they were abolished. Other writs which have been superseded by simpler proceedings, generally by ordinary actions, are those of the four assizes of novel disseisin, *juris utrum*, *mort d'auncester*, and *darrein presentment* (see ASSIZE), estrepement and waste (see WASTE), *monstrans de droit* (see PETITION), NUISANCE (*q.v.*), PARTITION (*q.v.*), *præmunire* (see TREASON), QUO WARRANTO (*q.v.*), SCIRE FACIAS (*q.v.*), *subpœna* (see TRUST), and *warrantia chartæ* (see WARRANTY). The number of writs was so large that any exhaustive list of them is almost impossible, but a few of those of more special interest which have become obsolete may be shortly mentioned. *Admensuratio* lay against persons usurping more than their share of property. It was either *dotis* or *pasturæ*, the latter, like the Scotch "souming and rouming," being the remedy for surcharge of common. *Alias* and *pluries* writs were issued when a previous writ had been disobeyed. *Attaint* lay to inquire by a jury of twenty-four whether a jury of twelve had given a false verdict. It was superseded in the 16th century by the practice of setting aside a verdict or granting a new trial, and was finally abolished by 6 Geo. IV. c. 50. *Audita querela* was a means of relieving a defendant by a matter of discharge occurring after judgment. After having been long practically superseded by stay of execution it was finally abolished by the rules made under the Judicature Act, 1875. *Capias*, *latitat*, and *quominus* are interesting as showing the extraordinary mass of fictitious allegation in the old procedure of the common law courts before 1832. By *capias ad respondendum* followed by *alias* and *pluries* the Court of Common Pleas was enabled to take cognizance of an action without the actual issue of an original writ. The *capias* was a judicial writ issued to follow an original writ of trespass *quia clausum fregit*. The issue of the original writ and after a time the issue of the *capias* became mere fictions, and proceedings commenced with the issue of another writ called *capias testatum*. On return of the writ the plaintiff elected to proceed with a cause of action other than trespass, and the real merits of the case were eventually reached in this tortuous manner. After being served with the *capias* the defendant was bound to put in common or special bail, the former being sufficient in all but exceptional cases. Here again there was a fiction, for his common bail were John Doe and Richard Roe. The same fictitious pair also appeared on the side of the plaintiff as his pledges for the due prosecution of his action. By *latitat* and *quominus* the Courts of King's Bench and Exchequer respectively assumed jurisdiction by a further series of fictions over ordinary civil actions. The writ of *latitat*, following the bill of Middlesex, itself in later times generally a fiction, alleged that the defendant was in hiding out of Middlesex, after committing a trespass *quia clausum fregit*, for which he was in the custody of the king's marshal in the Marshalsea prison. The real cause of action was then stated in what was called the *ac etiam* clause. Writs filed in the King's Bench and Common Pleas were in the custody of an officer of each court called the *custos brevium*. The writ of *quominus* alleged that the plaintiff was the king's debtor and that through the defendant's default he was unable to discharge the debt. *Deceit* or *disceit* lay for the redress of anything done deceitfullly in the name of another, but was especially used to reverse a judgment in a real action obtained by collusion. *Distraint of knighthood* was a mode of obtaining money for the crown by the exercise of the prerogative of forcing every one who held a knight's fee under the crown to be knighted or to pay a fine. The earliest extant writ was issued in 1278. It was abolished by 16 Car. I. c. 20. *Entry* was a possessory remedy against one alleged to hold land unlawfully. It was divided into a large number of kinds, and was the subject of much of the old real property learning. The ones most commonly occurring were the writs of entry in the *per* and in the *post*, the former alleging, the latter not, the title of the heir from the original disseisor. When writ had come to be equivalent in meaning to action, one of the divisions of possessory actions was into writs of entry and writs of assize. A special writ of entry for dower was given by 6 Edw. I. c. 7. *Excommunicato capiendo* was the authority for arresting an excommunicated person and detaining him until he was reconciled to the church; when he was liberated by the writ *de excommunicato deliberando*. These proceedings were abolished and the writ *de contumace capiendo* substituted by 57 Geo. III. c. 127 (see EXCOMMUNICATION). *Hæretico comburendo* was issued on certificate of conviction for heresy by the ecclesiastical court. A case of burning two Arians under this writ occurred as lately as the reign of James I. It was abolished by 29 Car. II. c. 9. *Homine replegiando*, mainprize, and *odio et atia* (or *bono et malo*) were all ancient means of securing the liberty of the subject, long superseded by the more effective procedure of *habeas corpus*. The last of the three enjoined the sheriff to inquire whether a committal on suspicion of murder was on just cause or from malice and ill-will. It was regulated by Magna Charta and the Statute of Westminster the Second, but, having been abused to the advantage of sheriffs, it was taken away by 28 Edw. III. c. 9. *Nisi prius* was given by the Statute of Westminster the Second, 13 Edw. I. c. 30. Its place is now taken by the commission of NISI PRIUS

Obsolete writs.

(*q.v.*). *Orando pro rege et regno*, before the present Book of Common Prayer, enjoined public prayers for the high court of parliament. *Privilege* commanded the release of a prisoner entitled to privilege of parliament. *Protection* was given for enabling a man to be quit of suits brought against him while absent beyond seas. It was dealt with by a large number of old statutes, but none has been issued since 1692. *Rebellion* was a means of enforcing obedience to the process of the Court of Chancery. In modern procedure attachment takes its place. *Rege inconsulto* commanded judges of a court not to proceed in a case which might prejudice the king until his pleasure should be known. *Replevin* was a survival of the most archaic law. The procedure consisted of writ on writ to an almost unlimited extent. It originally began by the issue of a writ of replevin or *replegiari facias*. The case might be removed from the county court to a superior court by writ of *recordari facias loquelam*. If the distrainor claimed a property in the goods distrained, the question of property or no property was determined by a writ *de proprietate probanda*, and, if decided in favor of the distrainor, the distress was to be returned to him by writ *de retorno habendo*. If the goods were removed or concealed, a writ of *capias in withernam* enabled the sheriff, after due issue of *alias* and *pluries* writs, to take a second distress in place of the one removed. It is said that the question whether goods taken in *withernam* could be replevied was the only one which the Admirable Crichton found himself unable to answer. For the modern practice, see DISTRESS, REPLEVIN. *Restitutione extracti ab ecclesia* lay for restoring a man to a sanctuary from which he had been wrongfully taken (see SANCTUARY). *Secta* lay for enforcing the duties of tenants to their lord's court, *e.g.*, *secta ad molendinum*, where the tenants were bound to have their corn ground at the lord's mill. *Seisina habenda* allowed delivery of lands of a felon to the lord after the king had had his year, day, and waste (see WASTE). *Vi laica removenda* is curiously illustrative of ancient manners. It lay where two parsons contended for a church, and one of them entered with a great number of laymen and kept out the other by force. As lately as 1867 an application for the issue of the writ was made to the Chancery Court of the Bermuda Islands, but refused on the ground that the writ was obsolete, and that the same relief could be obtained by injunction. On appeal this refusal was sustained by the privy council.

Writs now in use.

Of writs now in use, other than those for elections, all are judicial, or part of the PROCESS (*q.v.*)[1] of the court, except perhaps the writ of error in criminal cases. They are to be hereafter issued out of the central office of the Supreme Court, or the office of the clerk of the crown in Chancery, provision having been made by the Great Seal (Officers) Act, 1874, and the Judicature (Officers) Act, 1879, for the transfer on the next vacancy of the duties of the clerk of the petty bag to those officers. By the latter Act the record and writ clerks, previously officers of the Chancery Division, were abolished. By 40 and 41 Vict. c. 41 the wafer great seal or the wafer privy seal may be attached to writs instead of the impression of the great or privy seal. The judicial writs issue chiefly, if not entirely, from the central office, with which the old crown office was incorporated by the Act of 1879. The crown office had charge of writs occurring in crown practice, such as *quo warranto* and *certiorari*.

Judicial writs.

In local civil courts, other than county courts, writs are usually issued out of the office of the registrar, or an officer of similar jurisdiction. By 35 and 36 Vict. c. 86 writs of execution from such courts for sums under £20 [$97.20] may be stamped or sealed as of course by the registrar of a county court, and executed as if they had issued from the county court. In county court practice the WARRANT (*q.v.*) corresponds generally to the writ of the Supreme Court. Most of the present law on the subject of writs is contained in the Rules of the Supreme Court, 1883, Ord. xlii.–xliv., and in the Crown Office Rules, 1886. Both sets of rules contain numerous precedents in their schedules. By Ord ii. r. 8 of the rules of 1883 all writs (with certain exceptions) are to be tested in the name of the lord chancellor, or, if that office be vacant, in the name of the lord chief justice. The main exceptions are those which occur in crown practice, which are tested by the lord chief justice. The writ of error bears the tests of the king or queen, "witness ourselves." Before the issue of most writs a *præcipe*, or authority to the proper offices to issue the writ, is necessary. This is of course not to be confounded with the old original writ of *præcipe*. Writs affecting land must generally be registered in order to bind the land (see REGISTRATION). A writ cannot as a rule be served on Sunday (see SUNDAY). Some of the more important modern writs (other than those of an extrajudicial nature) may be shortly noticed. HABEAS CORPUS, MANDAMUS, and PROHIBITION (*qq.v.*) have been already treated. Writs are generally, unless where the contrary is stated, addressed to the sheriff. *Abatement* or *nocumento amovendo* enjoins the removal of a nuisance in pursuance of a judgment to that effect. *Ad quod damnum* is for the purpose of inquiring whether a proposed crown grant will be to the damage of the crown or others. It is still in use, and recent examples will be found in the *London Gazette*. If the inquiry be determined in favor of the subject, a reasonable fine is payable to the exchequer by 27 Edw. I. st. 2. *Attachment* is issued as a means of supporting the dignity of the court by punishment for contempt of its orders (see CONTEMPT OF COURT). Since the Judicature Acts a uniform practice has been followed in all the branches of the High Court, and a writ of attachment can now only be issued by leave of the court or a judge after notice to the party against whom it is to be issued. *Capias*: the old writs of *capias ad satisfaciendum* and *capias utligatum* may still be used, but their importance has been much diminished since the alterations made in the law by the Debtors Act, 1869, and the abolition of civil outlawry (see OUTLAW). *Certiorari* is a writ in very frequent use, by which the proceedings of an inferior court are brought up for review by the High Court. In general it lies for excess of jurisdiction as *mandamus* does for defect. The Summary Jurisdiction Act, 1879, makes the writ no longer necessary where a special case has been stated by a court of quarter sessions. *Delivery* enforces a judgment for the delivery of property without giving the defendant (unless at the option of the plaintiff) power to retain it on payment of the assessed value. *Distringas* lay to distrain a person for a crown debt or for his appearance on a certain day. Its operation has been much curtailed by the substitution of other proceedings by 28 and 29 Vict. c. 104, and the rules of the Supreme Court. It now seems to lie only against inhabitants for non-repair of a highway. *Distringas nuper vicecomitem* is a writ calling on an ex-sheriff to account for the proceeds of goods taken in execution. *Elegit* is founded on the Statute of Westminster the Second, and is so named from the words of the writ, that the plaintiff has chosen (*elegit*) this particular mode of satisfaction. It originally ordered the sheriff to seize a moiety of the debtor's land and all his goods, save his oxen and beasts of the plough. By 1 and 2 Vict. c. 110 the *elegit* was extended to include the whole of the lands, and copyholds as well as freeholds. By the Bankruptcy Act, 1883, an *elegit* no longer applies to goods. *Error*, the only example of an original writ remaining, was at one time largely used in both civil and criminal proceedings. It was abolished in civil procedure by the Common Law Procedure Act, 1852, and proceedings in error by the rules made under the Judicature Act, 1875. A writ of error to the Queen's Bench Division still lies in criminal cases, though it is rarely brought, for it only lies for mistakes appearing on the record, and recent legislation has given large powers of amending such mistakes. The fiat of the attorney-general is necessary before it can be sued out. *Exigent* (with *proclamation*) forms part of the process of outlawry now existing only against a criminal. It depends on several statutes, commencing in 1344, and is specially mentioned in the Statute of Provisors of Edward III., 25 Edw. III. st. 6. *Extent* is the writ of execution issued by the crown for a crown debt of record. The sale of chattels seized under an extent takes place under a writ of *venditioni exponas*. A crown debtor is entitled to an *extent in aid* against a person indebted to him. Where a crown debtor has died a writ reciting his death, and so called *diem clausit extremum*, issues against his property. *Fieri facias* is the ordinary writ of execution on a judgment commanding the sheriff to levy the sum, interest, and costs on the personal property of the party. Where the sheriff has not sold the goods, *venditioni exponas* issues to compel him to do so. Where the party is a beneficed clergyman, the writ is one of *fieri facias de bonis ecclesiasticis* or of *sequestrari facias* (addressed to the bishop). The latter writ also issues in other cases of an exceptional nature, as against a corporation and to seize a pension. It is addressed to commissioners, not to the sheriff. *Habere*

[1] It may be noticed that by the interpretation clause of the Sheriffs Act, 1887, the expression "writ" includes any process.

facias possessionem is given to the owner of a tithe or rent charge, enabling him to have possession of the lands chargeable therewith until arrears due to him are paid (see TITHES). *Indicavit* is still nominally grantable under the Statute *De Conjunctim Feoffatis* of 34 Edw. I., and is a particular kind of prohibition granted to the patron of an advowson. *Inquiry* issues for the assessment of damages by the sheriff or his deputy. It represents to some extent the old writ of *justicies*, and the later writ of trial allowed by 3 and 4 Will. IV. c. 42, but is narrower in its operation, for under the last-named writs the whole case or issues under it could be tried. Before an inquiry the liability has been already established. *Levari facias* is the means of levying execution for forfeited recognizances (see RECOGNIZANCE). The Bankruptcy Act, 1883, abolished it in civil proceedings. *Ne exeat regno* was at one time issued by virtue of the prerogative to prevent any person from leaving the realm, a form of restraint of liberty recognized by parliament in 5 Ric. II. c. 2. It has now become a means of preventing a debtor from quitting the kingdom, and so withdrawing himself from the jurisdiction of the court without giving security for the debt. There is some doubt whether it has not been impliedly superseded by the powers given by Ord. lxix. of the Rules of the Supreme Court. *Non omittas* is for executing process by the sheriff in a liberty or franchise, where the proper officer has neglected to do so. It rested originally chiefly upon the Statute of Westminster the Second, c. 39, and is now regulated by the Sheriffs Act, 1887, which repeals the previous enactment. *Possession* (also called *assistance*) enjoins the sheriff to give possession of land to the party entitled thereto under a judgment for such possession. In admiralty, where the judgment is for possession of a ship, the writ is addressed to the marshal. *Procedendo* is the converse of prohibition. It directs the lower court to proceed with the case. It also lies to restore the authority of commissioners suspended by *supersedeas*. *Restitution* restores property, either real or personal, after the right to it has been judicially declared. Thus it lies on behalf of the owner of real property under the statutes of forcible entry and of personal property under the Larceny Act, 1861. *Significavit*, once a writ, appears since 57 Geo. III. c. 127 to be merely a notice. It is a part of the proceedings against a person disobeying the order of an ecclesiastical court, and consists in a notification to the crown in Chancery of the disobedience. Thereupon a writ *de contumace capiendo* issues for his arrest. On his subsequent obedience or satisfaction, a writ of *deliverance* is granted. Precedents of these writs are given in the Act named. *Subpœna* is the ordinary means of securing the presence of a witness in court, and is addressed to the person whose attendance is required. It is so called from its containing the words "and this you are not to omit under the penalty of £100 [$486]," etc. The *subpœna* may be either *ad testificandum*, to give evidence, or *duces tecum*, to produce documents, etc., or both combined. By special order of a judge under 17 and 18 Vict. c. 23 a *subpœna* may be issued from any court in England, Scotland, or Ireland to compel the attendance of a witness out of the jurisdiction. *Summons* is the universal means of commencing an action in the High Court. It is addressed to the defendant, and may be either generally or specially endorsed with a statement of the nature of the claim made. The latter form of endorsement is allowed in certain cases of debt or liquidated demand, and gives the plaintiff the great advantage of entitling him to final judgment in default of appearance by the defendant, and even in spite of appearance unless the defendant can satisfy a judge that he has a defence or ought to be allowed to defend. No statement of claim is necessary in case of a specially endorsed writ, the endorsement being deemed to be the statement. The writ may be issued out of the central office or out of a district registry, and the plaintiff may name on his writ the division of the High Court in which he proposes to have the case tried. There are special rules governing the issue of writs in probate and admiralty actions. The writ remains in force for twelve months, but may be renewed for good cause after the expiration of that time. Service must be personal, unless where substituted service is allowed, and in special cases, such as actions to recover land and admiralty actions. Service out of the jurisdiction of a writ or notice of a writ is allowed only by leave of the court or a judge. Notice of the issue of a writ, and not the writ itself, is served on a defendant who is neither a British subject nor in British dominions. The law is contained in the Rules of the Supreme Court, especially Ord. ii.–xi. and xiv. *Supersedeas* commands the stay of proceedings on another writ. It is often combined with *procedendo*, where on a *certiorari* the High Court has decided in favor of the jurisdiction of the inferior court. It is also used for removing from the commission of the peace, and for putting an end to the authority of, any persons acting under commission from the crown. *Venire facias* is the first proceeding in outlawry, calling upon the party to appear. Under the old practice a *venire facias de novo* was the means of obtaining a new trial. *Ventre inspiciendo* appears still to be competent, and is a curious relic of antiquity. It issues on the application of an heir presumptive in order to determine by a jury of matrons whether the widow of a deceased owner of lands be with child or not. Almost exactly the same proceeding was known in Roman law under the name of *interdictum de inspiciendo ventre*, the prætor sending five women to make a report.

The principal writs of a non-judicial nature relate to parliament or some of its constituent elements. Parliament is summoned by the king's writ, issued out of Chancery by advice of the privy council. The period of forty days once necessary between the writ and the assembling is now by 15 and 16 Vict. c. 23 reduced to thirty-five days. Writs of summons are issued to the lords spiritual and temporal before every new parliament. Those to Irish representative peers are regulated by the Act of Union, those to archbishops and bishops by 10 and 11 Vict. c. 108. New peerages are no longer created by writ, but the eldest son of a peer is occasionally summoned to the House of Lords in the name of a barony of his father's. Earl Percy, the eldest son of the duke of Northumberland, was so summoned in 1887, and sits as Baron Lovaine (see PEERAGE). With respect to election of members of the House of Commons, the procedure differs as the election takes place after a dissolution or on a casual vacancy. After a dissolution the writ is issued, as already stated, by order of the crown in council. For a single election the warrant for a new writ is issued during the session by the speaker after an order of the house made upon motion; during the recess by the speaker's authority alone, under the powers given by 24 Geo. III. sess. 2, c. 26, 21 and 22 Vict. c. 110, and 26 Vict. c. 20. The warrant is addressed to the clerk of the crown in Chancery for Great Britain, to the clerk of the crown and hanaper of Ireland. A *supersedeas* to a writ has sometimes been ordered where the writ was improvidently issued. The time allowed to elapse between the receipt of the writ and the election is fixed by the Ballot Act, 1872, sched. 1, at nine days for a county or a district borough, four days for any other borough. The writ is to be returned by the returning officer to the clerk of the crown with the name of the member elected endorsed on the writ. Sched. 2 gives a form of the writ, which is tested, like the writ of error, by the queen herself. The returning officer is the sheriff in counties and counties of cities (such as Chester), generally the mayor in cities and boroughs, and the vice-chancellor in universities (see PARLIAMENT). Other writs for election are those for CONVOCATION (*q.v.*), which is by 25 Hen. VIII. c. 19 summoned by the archbishop of the province on receipt of the king's writ, and for election of coroners, verderers of royal forests, and some other officers whose office is of great antiquity. The writ *de coronatore eligendo*, addressed to the sheriff, is specially preserved by the Coroners Act, 1887.

Non-judicial writs.

Offences relating to writs are dealt with by the Criminal Law Consolidation Acts of 1861; larceny by 24 and 25 Vict. c. 96, s. 30; forgery by 24 and 25 Vict. c. 98, s. 27. The maximum penalty is seven years' penal servitude.

Scotland.—Writ is a more extensive term than in England. Writs are either judicial or extrajudicial, the latter including deeds and other instruments,— as, for instance, in 42 and 43 Vict. c. 44, and in the common use of the phrase "oath or writ" as a means of proof. In the narrower English sense both "writ" and "brieve" are used. The brieve was as indispensable a part of the old procedure as it was in England, and many forms are given in *Regiam Majestatem* and *Quoniam Attachiamenta*. It was a command issued in the king's name, addressed to a judge, and ordering trial of a question stated therein. Its conclusion was the will of the summons (see WILL, SUMMONS). In some cases proceedings which were by writ in England took another form in Scotland. For instance, the writ of attaint was not known in Scotland, but a similar end was reached by trial of the jury for wilful error.[1] The English writ of *ne exeat regno* is represented by the *meditatio fugæ* warrant. Most proceedings by brieve, being addressed to the sheriff, became obsolete after the institution of the Court of Session, when the sheriffs lost much of that judicial power which they had enjoyed to a greater extent than the English sheriff (see SHERIFF). The executive functions of the English sheriff are performed by the messengers-at-arms. An English writ of execution is represented in Scotland by diligence, chiefly by means by warrants to messengers-at-arms under the authority of signet letters in the name of the king. The brieve, however, has not wholly

Scotland.

[1] An example occurring in the reign of James VI. will be found in Pitcairn's *Criminal Trials*, vol. i. p. 216.

TYPEWRITER

PIANO

disappeared. Brieves of tutory, terce, and division are still competent, but not in use. Other kinds of brieve have been superseded by simpler procedure, *e.g.*, the brieve of service of heirs by 10 and 11 Vict. c. 47, for which a petition to the sheriff was substituted by that Act and 31 and 32 Vict. c. 101. The brieve of cognitiou of insane persons is now the only one of practical importance. The old brieves of furiosity and idiotcy were abolished, and this new form was introduced by the Act last named. Writs *eo nomine* have been the subject of much recent legislation. The writs of *capias, habeas, certiorari*, and extent were replaced by other proceediugs by 19 aud 20 Vict. c. 56. The writ of *clare constat* was introduced by 21 and 22 Vict. c. 76. It and the writs of resignation aud confirmation (whether granted by the crown or a subject superior) were regulated by 31 and 32 Vict. c. 101. By the same Act crown writs are to be in the English language, and registered in the register of crown writs. They need not be sealed unless at the instance of the party against whom they are issued. Writs of progress (except crown writs, writs of *clare constat*, and writs of acknowledgment) were abolished by 37 and 38 Vict. c. 94. The *clare constat* writ is one granted by the crown or a subject superior for the purpose of completing title of a vassal's heirs to lands held by the deceased vassal. Where the lands are leasehold the writ of acknowledgment under 20 and 21 Vict. c. 26 is used for the same purpose. By 40 and 41 Vict. c. 40 the form of warrant of execution on certain extracts of registered writs is amended. Extracts of registered writs are to be equivalent to the registered writs themselves. Writs registered in the register of sasines for preservation only may afterwards be registered for preservation and execution. By 22 Geo. II. c. 48, passed for the purpose of assimilating the practice of outlawry for treason in Scotland to that in use in England, the court before which an indictment for treason or misprision of treason is found, is entitled on proper cause to issue writs of *capias*, proclamation, and *exigent*. Many writs are by the Stamp Act, 1870, chargeable with a duty of five shillings [$1.22]. In some respects the proceedings iu parliamentary elections differ from those in use in England. Thus the writ in university elections is directed to the vice-chancellors of Edinburgh and Glasgow respectively, but not to those of St. Andrews and Aberdeen, and there is an extension of the time for the return in elections for Orkney and Shetland, and for the Wick burghs. Representative peers of Scotland were by the Act of Union to be elected after writ issued to the privy council of Scotland. On the abolition of the privy council a proclamation under the great seal was substituted by 6 Anne, c. 23.

United States.—Writs in United States courts are by Act of Congress to be tested in the name of the chief justice of the United States. By State laws writs are generally bound to be in the name of the people of the State, in the English language, and tested in the name of a judge. Writs of error have been the subject of much legislation by the United States and by the States. In New York writs of error and of *ne exeat* have been abolished. Writs as parts of real actions have been generally superseded, but in Massachusetts a writ of entry on disseisin is still a mode of trying title. Writs of dower and of estrepement are still in use in some States. By the law of some States, *e.g.*, New Jersey, writs of election are issued to supply casually occurring vacancies in the legislature.

United States.

Authorities.—The importance of the writ in procedure led to the compilation of a great body of law and precedent at an early date. In addition to the *Registrum Brevium* there were, among other old works, the *Natura Brevium*, first published in 1525; Theloall, *Le Digest des Briefes Originales* (1579); Fitzherbert, *Le Nouvel Natura Brevium* (1588); *Officina Brevium* (1679). See, too, Coke upon Littleton, 158, 159, 2 Coke's *Institutes*. 39. Many precedents will also be found in the collection of Parliamentary Writs and in Stubbs's *Select Charters*. Old books of practice, such as Tidd's *Practice*, Corner's *Crown Practice*, and Booth *On Real Actions*, contained much law on the subject. For the history Spence's *Equitable Jurisdiction*, vol. i. bk. ii. ch. viii., Forsyth's *Hist. of Trial by Jury*, Stephen *On Pleading*, and Bigelow's *Hist. of Procedure*, ch. iv., may be consulted. There appears to be no book dealing with the writ in modern practice, but sufficient information is contained in the ordinary treatises on procedure. (J. W†.)

WRITING MACHINES. Machines and appliances of various kinds are in common use to facilitate the process of writing, and to produce copies of writings already made with the pen. Such facsimile writings are obtained by numerous devices, all of which, however, come under the heads (1) of manifolding, (2) of processes analogous in principle to lithography, and (3) of stencilling. The simplest form of manifold writing is by sheets of paper prepared with lampblack being interleaved between the sheets of white paper on which the impressions are to be taken, and writing over the whole with a style or other sharp-pointed instrument. By this means a considerable number of copies can be made at one time, and the method is in general use among newspaper writers and telegraphists in the production of what is technically known as "flimsy," where several copies of the same matter are required. Of processes analogous to lithography, the best known is the "hektograph" method, in which the writing is done in the first instance on paper with aniline ink, and then a transfer is made to a gelatine composition which gives off a considerable number of impressions. In principle the autocopyist is like the hektograph, but in this apparatus the writing is done with a special ink, which is transferred to a prepared and properly stretched sheet of parchment. From this parchment copies are obtained precisely as from a lithographic stone on which a transfer has been impressed. Of the apparatus worked in the stencil method, the cyclostyle has been most extensively adopted. This machine consists of a frame of sufficient size containing a plate of tin on which the paper from which the impression is to be taken is rested. The paper is prepared in a particular way, and the "pen" with which the writing is done consists of an ordinary wooden holder, at the end of which is fixed on a pivot a minute wheel. The edge of the wheel is studded with fine points, which, as it revolves and turns in the direction of the writing, pierce the paper, thus making a perfect stencil. The ink is passed over the top of this stencil by means of a roller, and the impression is left on a sheet of ordinary paper placed beneath.[1]

The principal substitute for the pen, however, is the machine now generally known as the type-writer, which in its present form dates only from 1873, but it has within that time come into extensive use, especially in America, the country of its origin. Numerous attempts to produce type-writing machines had been previously made both in England and America. So long ago as 1714 one Henry Mill took out a patent for a machine which he described as "an artificial machine or method for the impressing or transcribing of letters, singly or progressively, one after another as in writing, whereby all writings whatsoever may be engrossed in paper or parchment so neat and exact as not to be distinguished from print"; but his instrument is said to have been clumsy and useless, and led to no practical result. In 1867 the idea was taken up by Messrs. C. Latham Sholes and Samuel W. Soulé, printers in Milwaukee, and Mr. Carlos Glidden, and, after many experiments and failures, a practical working machine was elaborated in 1873, which, being originally made by Messrs. E. Remington & Sons, of Ilion, N. Y., is known as the Remington standard type-writer. The success of this machine has induced many inventors to enter the field, and now three principal classes of type-writers are more or less in use. These are (1) type-bar machines, (2) cylinder machines, and (3) wheel machines. The Remington is the type and original of all type-bar machines, which are so called because the steel types are fixed at the extremity of a bar or rod of iron. These bars are in the Remington arranged in a circle around a common centre, and by striking the key of any particular letter, a lever is moved which raises the type-bar, and causes the type at its point to strike on an inked ribbon, and impresses the letter on the paper, which lies against an india-rubber roller. The type-bars are so hinged that all the types as they are struck hit precisely the same spot, so that were the paper to remain stationary the impressions of all the types struck would be superimposed on each other; but, by an automatic mechanism, the cylinder with the paper

[1] The trypograph is also a stencil-using device, in which a simple style is used for writing, but the paper is stretched over a fine and sharply corrugated metallic plate which punctures the paper as the style passes over it.

moves a space to the left after the impression of each type, and the depression of a wooden bar similarly moves the cylinder a space after each word without impressing any sign. In the recent forms of the Remington machine, each type bar carries two types, capital and lower case, or other duplicate signs, the one a little behind the other, and when a capital letter is to be printed the depression of a key shifts the position of the cylinder so as to bring the second type in contact with the ink ribbon. In this way from one set of keys two sets of type can be with facility acted upon. With practice, an average writing speed of forty words per minute can easily be attained on the Remington type-writer, and very expert writers have been able to keep up a speed of from sixty to seventy words for a short time. It is safe to say that type-writing can be ordinarily done at about three times the speed of ordinary handwriting. In the cylindrical machines the letters and signs are all upon a cylinder or "sleeve," and the striking of a key produces a combined lateral and rotary motion for bringing the proper type to the common printing point. Thus, for every separate impression the entire cylinder has ordinarily to make two movements of variable length, and the instrument is noisy in operation, and does not possess the rapid direct action of the type-bar machines. On the other hand, it is a variable spacer, giving more space to such wide letters as m and w than to the narrow letters i, t, and l, a distinct advantage over the type-bar machines, where each letter, wide or narrow, occupies precisely the same space. Of such cylinder machines the newest form is the Crandall type-writer, an apparatus supplied with spare type cylinders or "sleeves," which are easily separated and attached, so that many kinds of type can be brought into actual use. Of wheel machines the Columbia may be taken as one of the most recent examples. It is a simple and cheap apparatus in which the letters and signs are placed on the periphery of a wheel by the rotation of which any desired type is brought into position for printing. The machine is furnished with a dial index and pointer to indicate the type which is in position. The wheel machine has the advantages of variable spacing, and wheels with type of different character can readily be placed on it; on the other hand, it is not capable of being run with a rapidity nearly so great as can be secured with type-bar machines.[1]

WRYNECK (Germ. *Wendehals*, Dutch *Draaihalzen*, French *Torcol*), a bird so called from its wonderful way of writhing its head and neck, especially when captured, as it may easily be, on its nest in a hollow tree. The *Iynx*[2] *torquilla* of ornithology, it is a regular summer-visitant to most parts of Europe, generally arriving a few days before the Cuckow, and it is in many countries known by some name associating it with that well-known bird—as in England "Cuckow's leader" and "Cuckow's mate"—but occasionally it it is called "Snakebird," not only from the undulatory motions just mentioned, but from the violent hissing with which it seeks to repel an intruder from its hole.[3]

The very unmistakable note of the Wryneck, without having any intrinsic merit, is always pleasant to hear as a harbinger of spring. It is merely a repetition of what may be syllabled *que, que, que,* many times in succession, rapidly uttered at first, but gradually slowing and in a continually falling key. This, however, is only heard during a few weeks, and for the rest of the bird's stay in Europe it seems to be mute. It feeds almost exclusively on insects, especially on ants, and may often be seen on the ground, busily engaged at their nests. Somewhat larger than a Sparrow, its plumage is not easily described, being beautifully variegated with black, brown, buff, and gray—the last produced by minute specks of blackish-brown on a light ground—the darker markings disposed in patches, vermiculated bars, freckles, streaks, or arrow-heads—and the whole blended most harmoniously, so as to recall the coloration of a GOATSUCKER (*q.v.*) or of a WOODCOCK (*q.v.*). The Wryneck builds no nest, but commonly lays its translucent white eggs on the bare wood of a hole in a tree, and it is one of the few wild birds that can be induced to go on laying by abstracting its eggs day after day, and thus upwards of forty have been taken from a single hole—but the proper complement is from six to ten. As regards Britain, the bird is most common in the southeast, its numbers decreasing rapidly towards the west and north, so that in Cornwall and Wales and beyond Cheshire and Yorkshire its occurrence is but rare, while it appears only by accident in Scotland and Ireland.

Some writers have been inclined to recognize five other species of the genus *Iynx;* but the so-called *I. japonica* is specifically indistinguishable from *I. torquilla;* while that designated, through a mistake in the locality assigned to it, *I. indica*, has been found to be identical with the *I. pectoralis* of South Africa. Near to this is *I. pulchricollis*, discovered by Emin Pasha in the east of the Bar-el-Djebel (*Ibis*, 1884, p. 28, pl. iii.). Another distinct African species is the *I. æquatorialis*, originally described from Abyssinia. The Wrynecks, as already stated (WOODPECKER, *supra*, p. 687) form a Subfamily *Iynginæ* of the *Picidæ*, from the more normal groups of which they differ but little in internal structure, but much in coloration and in having the tail-quills flexible, or at least not stiffened to serve as props as in the climbing *Picinæ*. (A. N.)

WUHU, or Woo-Hoo, a district city in the province of Gan-hwuy, China, is situated about a mile from the south bank of the Yang-tsze Keang river, with which it is connected by a straggling suburb. By the treaty of 1858 it was marked out as one of the treaty ports, but it was not opened to trade until 1877. At first its commercial progress was very slow, the neighborhood of the older ports of Kew-keang and Chin-keang militating against its success; but of late years there has been a distinct improvement in the trade of the port, the gross value of which was £1,316,863 [$6,399,954.18] in 1885 and £2,011,327 [$9,775,049.22] in 1886. The principal exports are rice and silk piece goods, while next in importance come feathers, hides, nutgalls, and tea. For the production of feathers large quantities of ducks are reared in the surrounding districts. Of imports, opium is by far the most considerable item, amounting in 1886 to 779,728 lb, of the value of £652,223 [$3,169,803.78]. In the same year £126,093 [$612,811.98] worth of cotton goods were imported, and £124,014 [$602,708.04] worth of sugar. Of the minor articles, matches, needles, sandalwood, and window glass form the largest items. During the same period 1088 vessels entered the port (691 British, 362 Chinese). The city, which is one of the largest of its rank in China, was laid desolate during the T'ai-p'ing rebellion, but it is gradually becoming repeopled.

WUN, a British district in the chief commissionership of Berar, lying between 19° 46′ and 20° 42′ N. lat., and between 77° 26′ and 79° 10′ E. long., and containing an area of 3907 square miles. It is bounded on the N. and W. by Amraoti and Basim districts, on the S. by the Nizam's Dominions, and on the E. by Wardhá and Chándá districts of the Central Provinces. Wún is a wild hilly country intersected by offshoots from the Ajanta chain of mountains. For the most part the hills in the district are bare, or clothed only with dwarf teak or small jungle; but on the heights near Wún town the bamboo grows abundantly, and elsewhere small bamboos are found in the ravines. The Wardhá and Paingangá, which bound the district on the east and south, unite at its southeast

[1] [The Caligraph, manufactured at Hartford, Conn., is a well-known type-bar machine, and the Hammond, made in New York city, is one of the best wheel machines for which a speed equal to any bar-machine is claimed. The latter is a most ingenious mechanism.—AM. ED.]

[2] Frequently misspelt, as by Linnæus in his later years, *Yunx*.

[3] The peculiarity was known to Aristotle, and possibly led to the cruel use of the bird as a love-charm, to which several classical writers refer, as Pindar (*Pyth.* iv. 214; *Nem.* iv. 35), Theocritus (iv. 17, 30), and Xenophon (*Memorabilia*, III. xi. 17, 18). In one part at least of China a name, *Shay-ling*, signifying "Snake's neck," is given to it (*Ibis*, 1875, p. 125).

eorner. The Paingangá carries off nearly all the drainage of the district. Wún is rich in coal and iron ores. Of wild animals the tiger, leopard, and hyæna abound; bears, wolves, and jackals are also numerous; while small game is plentiful in all parts. There is a great want of means of communication; during the rains cart traffic is entirely suspended, the only means of transit at this time of the year being that afforded by water from the Wardhá for a short distance. The climate is enervating and unhealthy, and the average annual rainfall is about 41 inches.

Wún district forms part of the territory assigned by the nizam to the British Government under the treaties of 1853 and 1860. It was undisturbed during the mutiny of 1857. In 1886–87 the gross revenue amounted to £86,174 [$418,705.64], of which the land contributed £57,391 [$268,920.26]. The population in 1881 was 392,102 (males 201,491, females 190,611); Hindus numbered 335,787, Mohammedans 17,031, Christians 127, and aboriginals 37,252. Wún, the chief town of the district (population 4207), has some fine temples.

WURTEMBERG,[1] or WURTTEMBERG, a European kingdom, forms a tolerably compact mass in the southwest angle of the German empire, of which it is the third factor in point of area and the fourth in point of population. In the south it is cleft by the long narrow territory of Hohenzollern, belonging to Prussia; and it encloses six small enclaves of Baden and Hohenzollern, while it owns seven small exclaves within the limits of these two states. It lies between 47° 34′ 48″ and 49° 35′ 17″ N. lat., and between 8° 15′ and 10° 30′ E. long. Its greatest length from north to south is 140 miles; its greatest breadth is 100 miles; its boundaries, almost entirely arbitrary, have a circuit of 1116 miles; and its total area is 7531 square miles, or about one twenty-eighth of the entire empire. It is bounded on the E. by Bavaria, and on the other three sides by Baden, with the exception of a short distance on the S., where it touches Hohenzollern and the Lake of Constance. For administrative purposes the country is divided into the four circles ("kreise") of the Neckar in the northwest, the Jagst in the northeast, the Black Forest in the southwest, and the Danube in the southeast.

See sketch map vol. iii. p. 193.

Würtemberg forms part of the South-German tableland, and is hilly rather than mountainous. In fact the undulating fertile terraces of Upper and Lower Swabia may be taken as the characteristic parts of this agricultural country. The usual estimates return one-fourth of the entire surface as "plain," less than one-third as "mountainous," and nearly one-half as "hilly." The average elevation above the sea-level is 1640 feet; the lowest point is at Böttingen (410 feet), where the Neckar quits the country; the highest is the Katzenkopf (3775 feet), on the Hornisgrinde, on the western border.

Mountains.

The chief mountains are the Black Forest on the west, the Swabian Jura or Rauhe Alb, stretching across the middle of the country from southwest to northeast, and the Adelegg Mountains in the extreme southeast, adjoining the Algau Alps in Bavaria. The Rauhe Alb or Alp slopes gradually down into the plateau on its south side, but on the north it is sometimes rugged and steep, and has its line broken by isolated projecting hills. The highest summits are in the southwest, viz., the Lemberg (3326 feet), Ober-Hohenberg (3312 feet), and Plettenberg (3293 feet). In a narrower sense the name Rauhe Alb is reserved for the eastern portion only of the Swabian Jura, lying between Hohenzollern and Bavaria; in the narrowest sense of all it is applied to a single group near Reutlingen. Most of the isolated summits above referred to (none of which are over 2630 feet) project from this eastern section; among them are the hills of Hohenstaufen, Teck, Mossingen, and Hohenzollern.

Black Forest.

The Black Forest (Germ. *Schwarzwald*), a mountain group or sytem deriving its name from the dark foliage of its pine forests, lies partly in Würtemberg and partly in Baden. Its general shape is that of a triangle, its base resting on the Rhine between the Lake of Constance and Basel, and its apex pointing north. It stretches along the east bank of the Rhine from Basel to Durlach, at a distance varying from 4 to 15 miles from the river, and parallel to the Vosges range on the west bank. The south, west, and north faces of the group are rugged and steep, but on the east it loses its mountainous character, and melts so gradually into the bounding plateau that it is difficult to assign it definite limits on that side. The total length of the Black Forest range is 93 miles, its breadth varies from 46 to 13 miles, and its area is 1913 square miles. The average elevation decreases from south to north from 3280 feet to 2296 feet. The hills do not rise in peaks but in rounded summits and plateau-like masses and combs, separated from each other by the deep ravines of the streams.

The south part of the Black Forest was called *Mons Abnoba* by the Romans, and the whole was known to them from the 3d century as *Silva Marciana*. The name *Silva Nigra* appears in mediæval Latin. This retired district, always somewhat overshadowed by the majestic beauties of the neighboring Swiss Alps, was long unvisited and almost unheard of. Within comparatively recent years, however, it has become a favorite resort for summer visitors and tourists. Though not boasting any very striking mountain scenery, the Black Forest includes romantic and wild vales as well as smiling and picturesque valleys; and the beauty of its streams and waterfalls, its fragrant and shady forests, the quaintness of its sequestered villages and the primitive simplicity of its inhabitants, who still retain their peculiar costume, are all objects of interest.

About two-thirds of the Black Forest belongs to Baden and the remaining third to Würtemberg; but it is convenient to disregard the political boundaries, and to consider it as formed of the Southern or Upper and the Northern or Lower Black Forest, separated from each other by the deep and romantic gorge of the Kinzig. The principal rocks are stratified gneiss and eruptive granite, though some of the summits are porphyritic. In the north and east those rocks are covered with a tolerably thick layer of variegated and red sandstone, which also appears, though not so abundantly, in the south and west. The kernel of the Southern Black Forest is the Feldberg (4803 feet), the highest point in the range, round which the other summits and masses are grouped. Among the chief summits are the Belchen (4640 feet), the Erzkasten (4218 feet), the Hochkopf (4150 feet), and the Kandelberg (4077 feet). The average height of the crest in this division of the forest is about 3300 feet. The chief streams are the Wutach, Alb, Wehra, Wiese, Neumagen, and Dreisam, all tributaries of the Rhine, and the Brege and Bregach, regarded as the head-waters of the Danube. On the eastern slopes lie the Feldsee, Titisee, Schuchsee, and numerous other small lakes, most of them in bleak and solitary situations among the extensive moors. The waterfall on the Gutach, at Triberg, is 170 feet high. The central height of the Northern Black Forest is the Hornisgrinde (3825 feet), on the border between Würtemberg and Baden. Other heights are the Hohe Ochsenskopf (3460 feet), the Hohloh (3225 feet), and the Kniebishohen (3180 feet), with the Kniebis Pass. The average height of the crest is 2470 feet. The principal streams are the Kinzig and Murg, which join the Rhine, and the Glatt, Enz, and Nagold, which fall into the Neckar. The eastern slopes of this division also are sprinkled with lakes, the chief of which are the gloomy Mummelsee and the Wildesee.

As the name implies, the Schwarzwald is largely covered with forests, chiefly of pines and firs. Oaks, beeches, etc., also flourish, especially in the valleys and towards the west. The timber trade and its cognate industries are thus the chief resources of the inhabitants. The felled timber is floated in the form of rafts down the numerous streams to the Neckar or Rhine, where larger rafts are formed, sometimes requiring a crew of several hundred men, for the voyage to Holland, the principal market. The increase of railways has, however, considerably diminished the quantity of wood thus exported by water; and numerous sawmills within the limits of the forest are engaged in cutting timber into planks for export by rail. Perhaps, however, the most characteristic industry of the Black Forest is the

[1] The origin of the name is disputed, though the once popular derivation from "Wirth am Berg" is universally rejected. Some authorities derive it from an old proper name Wirnto or Wirtino, others from a Celtic place-name Virodunum or Verdunum. Wirtenberc, Wirtenberg, Wirtemberc are early forms. Wirtemberg was long current, and in the latter half of the 16th century Würtemberg and Württemberg appear. The last was adopted in 1806 as the official spelling, though Würtemberg, the ordinary English spelling, is also common, and occurs sometimes in official documents and even on coins issued after that date.

manufacture of wooden clocks (often spoken of as "Dutch clocks"). This industry has long flourished in the district, and has recently been organized and extended, while considerable factories have been established at Furtwangen, Triberg, and other chief centres. Clocks to the value of about £2,000,000 [$9,720,000] are said to be annually produced, and 1400 persons are engaged in their manufacture. Musical-boxes are also extensively made here. Straw-plaiting occupies a large number of girls and women, especially in winter; and glass-blowing, charcoal-burning, and potash-boiling are also carried on. Agriculture is of no great importance, as the soil is poor, and the crops scanty. Cattle are kept in considerable numbers; they are driven up to the mountains in summer, and return to the valleys in autumn. The mining industry is quite insignificant; coal is worked to a small extent in and near Rotliegenden. In spite of their industrial resources, aided by the wealth introduced by tourists and visitors to the numerous mineral springs, the population of the Black Forest is too numerous to find support at home, and large numbers go abroad as peddlers, merchants, servants, etc.

The climate of the Schwarzwald is severe, but healthy. The forests cease at 4250 feet, and are succeeded by scanty grass and herbs. On many of the summits snow lies for ten months in the year, yet in some of the valleys vines, almonds, and chestnuts ripen. Wild boars, deer, hares, foxes, and various kinds of game are found. The carriage-roads follow the valleys, but innumerable footpaths lead in all directions through the magnificent woods. The Black Forest railway, opened in 1873, ascends the picturesque valleys of the Kinzig and Gutach by means of bridges, viaducts, and tunnels, often of the boldest construction.

To the south of the Rauhe Alb the plateau of Upper Swabia stretches to the Lake of Constance and eastwards across the Iller into Bavaria. Between the Alb and the Black Forest in the northwest are the fertile terraces of Lower Swabia, continued on the northeast by those of Franconia.

Rivers.

About 70 per cent. of Württemberg belongs to the basin of the Rhine, and about 30 per cent. to that of the Danube. The principal river is the Neckar, which flows northward for 186 miles through the country to join the Rhine, and with its tributaries drains 57 per cent. of the kingdom. On the west it receives the Enz, swelled by the Nagold, and on the east the Fils, Rems, Murr, Kocher, and Jagst. The Danube flows from east to west across the south half of Württemberg, a distance of 65 miles, a small section of which is in Hohenzollern. Just above Ulm it is joined by the Iller, which forms the boundary between Bavaria and Württemberg for about 35 miles. The Tauber in the northeast joins the Main; the Argen and Schussen in the south enter the Lake of Constance. The lakes of Württemberg, with the exception of those in the Black Forest, all lie south of the Danube. The largest is the Federsee (640 acres) near Buchau. About one-fifth of the Lake of Constance is reckoned to belong to Württemberg. Mineral springs are abundant; the most famous spa is Wildbad, in the Black Forest.

Climate and soil.

The climate is temperate,—colder among the mountains in the south than in the north. The mean temperature varies at different points from 43° to 50° F. The abundant forests induce much rain, most of which falls in summer. The soil is on the whole fertile and well-cultivated; and for many centuries agriculture was almost the only resource of the inhabitants. Middle and Lower Swabia are the most fertile districts. The removal of burdens and restrictions in 1848 and 1849, and intelligent state-aid, combined with the formation of agricultural societies, have encouraged farming, but the practice of parcelling the land in minute patches among the members of the communities still retards progress. According to returns made in 1878, 45.2 per cent. of the land was under agriculture, 30.7 under forest, 19.4 in pasture, 1.2 in vineyard, and the remainder unproductive. Grain is produced in excess of the home demand.

Agriculture.

The following table shows the average annual extent (in acres) of the chief crops in 1878–1880, and the value:

Spelt.....	492,000	£3,001,410	Barley	225,000	£1,288,200
Oats.....	334,400	1,475,470	Potatoes...	194,900	718,600
Rye.....	96,800	493,475	Beetroot...	49,242	340,200

Pease, maize, rape, hemp, flax, hops, and chicory are also produced in considerable quantity; tobacco is grown in the valley of the Neckar. Württemberg is very rich in fruit trees of various kinds, and market-gardening flourishes near the larger towns and in the Remsthal. In 1880 there were 35,000 acres under vegetables. The cultivation of the vine is a highly important industry in the valleys of the Neckar and some of the other streams. In the period 1827-1882 the average annual area under vines was 63,327 acres, yielding 5,701,454 gallons of wine, worth £411,700 [$2,000,862]. The best year was 1835, when 22,303,006 gallons were produced, the worst was 1854, with 1,696,376 gallons. Among the best Württemberg wines are those known as Rothenberger, Türkheimer, Lämmler, Brodwasser, Käsberger, Elpinger, Schalksteiner, Weinsberger, Markelsheimer, Verrenberger, and Lindelberger. About one-third of the entire country is under forest, the greater proportion of which consists of deciduous trees (oaks, beeches, etc.). Coniferous trees are most numerous in the Black Forest, in Upper Swabia, and in the circle of Jagst. Most of the forests belong to the state or to public companies, and are carefully and skilfully managed. Large tracts in the Black Forest are in the hands of the "Schiffergesellschaft," a very ancient guild of timber merchants.

Live stock.

In 1883 Württemberg contained 96,885 horses, 904,139 cattle, 550,104 sheep, 292,206 swine, and 54,876 goats. The breeding of horses commands a good deal of attention from Government, which maintains several stud-farms. Cattle, bred for export, are reared mainly in the Jagst and Danube divisions, sheep on and near the Alb.

Minerals.

Salt and iron are the only minerals of industrial importance found in Württemberg, and both are worked almost entirely by Government. There are five Government salt-works (the chief of which are Friedrichshall and Wilhelmsglück), employing together 425 hands. In 1879–80 970,084 tons of salt were produced, two-thirds by mining. The salt industry only began to be of importance at the beginning of the present century. The iron industry on the other hand is of great antiquity, though it is much hampered by the entire absence of coal mines in Württemberg. The chief fuel used in smelting the iron is wood or charcoal. Iron is mined at Neuenbürg, Freudenstetten, and, to a very limited extent, in the Black Forest. In 1877–1880 15,546 tons of ore were raised by 110 miners, yielding about 33 per cent. of raw metal. Cement, gypsum, grindstones, millstones, building-stones, etc., are also found. The annual value of the minerals of all kinds raised in Württemberg has been roughly estimated at about £350,000 [$1,701,000].

Manufactures.

Until the close of the Napoleonic wars, Württemberg was almost exclusively an agricultural and bucolic country; but since that period it has turned its attention to trade and manufactures, and perhaps now stands second only to Saxony among the German states in commercial and industrial activity. The want of coal is naturally a serious drawback, but it is to a certain extent compensated by the abundant water-power. The textile industry is carried on in most of its branches. Wool, from both domestic and foreign sources, is woven at Esslingen, Göppingen, and other towns in Lower Swabia; cotton is manufactured in Göppingen and Esslingen, and linen in Upper Swabia. Lace-making also flourishes in the last-named district, as a rural house-industry. The silk industry of Württemberg, which employs about 1100 hands, though not very extensive in itself, is the most important silk industry in Germany. Ravensburg claims to have possessed the earliest paper-mill in Germany: paper-making is still important in that town and at Heidenheim, Heilbronn, Göppingen, and other places in Lower Swabia. Government owns six iron foundries and puddling works, the most important of which is at Wasseralfingen, where over 1000 hands are employed. The locomotive engines of Esslingen enjoy a wide reputation; and agricultural and other machinery, boilers, and tools of various kinds are also manufactured and exported by various towns. The organs of Ludwigsburg are well known; bell-founding is carried on at Stuttgart, Reutlingen, and Cannstatt; beetroot sugar and beer are considerable items in the list of annual produce; wine has been already mentioned. The manufacture of chemicals at Stuttgart, Heilbronn, etc., is important.

Trade has prospered since Württemberg joined the North

German Customs Union in 1834. The leading trading towns are Heilbronn, Stuttgart, Ulm, and Friedrichshafen. Cattle, horses, sheep, agricultural produce, timber, salt, and various manufactured goods are the chief exports; coal, hops, steel goods of various kinds, eggs, and poultry are among the chief imports. The book trade of Stuttgart is very extensive; that town has been called the Leipsic of southern Germany.

Trade.

In 1887 991 miles of railway were open for traffic in Würtemberg. With the insignificant exception of two private lines, together no more than 31 miles long, all the railways are in the hands of the state. The Neckar, the Schussen, and the Lake of Constance are all navigable for boats; the Danube begins to be navigable at Ulm. The roads of Würtemberg are fairly good; the oldest are Roman. Würtemberg, like Bavaria, retained the control of its own postal and telegraph system on the foundation of the new German empire. In 1885 there were 1750 miles of telegraph wires in the kingdom.

Communication.

In 1885 the population of Würtemberg was 1,995,168, or one twenty-third of the total population of Germany on one twenty-eighth of its area. The average per square mile is 264.9. The following table shows the distribution of the population among the administrative districts, and their religion. The Neckar division contains most large towns.

Population.

Division.	Population.	Area in Sq. Miles.	Inhabitants per Sq. Mile.	Protestants in 1880.	Roman Catholics in 1880.
Neckar	639,470	1285	497.6	562,700	53,026
Black Forest	475,299	1843	257.8	351,144	119,750
Jagst	405,034	1984	204.1	280,374	122,987
Danube	475,365	2419	196.5	170,362	294,527

The people of the northwest belong to the Alemannic stock, those of the northeast to the Franconian, and those of the centre and south to the Swabian. According to the occupation census of 1882, the following were the numbers of those (including their families and dependants) engaged in the various departments of work: in agriculture, forestry, etc., 942,924; in mining and industrial pursuits, 674,081; in trade and commerce, 143,258; in domestic and other service, 11,254; in professions, 95,712; "no returns," 90,240. In 1886 there were 3717 emigrants; in 1881 there were 11,470.

In 1885 there were 15 towns with more than 10,000 inhabitants, viz., Stuttgart (125,906), Ulm (33,610), Heilbronn (27,758), Esslingen (20,864), Cannstatt or Canstatt (18,031), Reutlingen (17,319), Ludwigsburg (16,201), Gmünd (15,321), Tübingen (12,551), Göppingen (12,102), and Ravensburg (11,482).

About two-thirds of the population are Protestants. In 1880, when the total population was 1,971,118, there were 1,364,580 Protestants, 590,290 Roman Catholics, 13,331 Jews, 2817 of other Christian sects, and 98 "others." The Protestant church is controlled (under the minister of religion and education) by a consistory and a synod,—the latter being made up of the consistory and six general superintendents or "prelates" from six principal towns. But no laws are made or altered without the consent of a representative council, including both lay and clerical members. The Roman Catholic church is subject to the bishop of Rottenburg, in the archdiocese of Freiburg. Politically it is under a Roman Catholic council, appointed by Government. The Jews also since 1828 have been subject to a state-appointed council.

Religion.

Würtemberg is one of the best educated countries of Europe. School attendance is compulsory on children from seven to fourteen years of age, and young people from fourteen to eighteen must either attend the schools on Sunday or some other educational establishment. Every community of at least 30 families must have a school. The different churches attend to the schools of their own confession. There is a university at Tübingen, and a polytechnic school at Stuttgart. Technical schools of various kinds are established in many of the towns, in addition to a thorough equipment of gymnasia, commercial schools, seminaries, etc. The conservatory of music at Stuttgart enjoys a high reputation.

Education.

Würtemberg is a constitutional monarchy and a member of the German empire, with 4 votes in the federal council and 17 in the imperial diet. The constitution rests on a law of 1819, amended in 1868 and 1874. The crown is hereditary, and conveys the simple title of king of Würtemberg. The king receives a civil list of £90,670 [$440,656.20], and the "apanages" of the crown amount to £14,900 [$72,414] more. The legislature is bi-cameral. The upper chamber (Standesherren) is composed of adult princes of the blood, heads of noble families from the rank of count (Graf) upwards, representatives of territories (Staudesherrschaften) which possessed votes in the old German diet, and of life members nominated by the king. The number of this last class must not exceed one-third of the house. The lower house (Abgeordneten-Haus) has 93 members, viz., 13 noble landowners, elected by their peers (Ritterschaft), the 6 Protestant "prelates," the Roman Catholic bishop, and 2 other official Roman Catholic members, the chancellor of the university of Tübingen, 7 representatives from the chief towns, and 63 representatives from country districts. The king appoints the president of the upper chamber; since 1874 the lower chamber has elected its own chairman. Members are elected for six years by ballot; the suffrage is enjoyed by all male citizens. With the exception of the royal princes and the life-members of the upper house that reside in Stüttgart, the members of both houses receive a daily payment of 9m. 41pf. (9s. 5d.) [$2.29] each.

Constitution.

The highest executive is in the hands of a ministry of state (Staatsministerium), consisting of six ministers and the privy council, the members of which are nominated by the king. There are ministers of justice, war, finance, home affairs, religion and education, and foreign affairs, railways, and the royal household. The legal system is framed in imitation of that of the German empire. The judges of the supreme court for impeachments of ministers, etc., named the Staatsgerichtshof, are partly elected by the chambers and partly appointed by the king. The country is divided into four administrative "circles," subdivided into 64 "Oberämter," each of which is under an "Oberamtmann," assisted by an "Amtsversammlung" or local council. At the head of each of the four large divisions is a "Regierung."

The official finance period of Würtemberg embraces two years. For 1885–1887 the budget showed an annual income of £2,811,921 [$13,665,936.06], balanced by the expenditure, which included a payment of £2500 [$12,150] to a reserve fund. The chief sources of income were taxes (£1,392,893 [$6,769,459.98], including £691,773 [$3,362,016.78] of direct taxes), and public domains and monopolies (£1,095,336 [$5,323,332.96], including £662,385 [$3,219,191.10] from railways and £72,741 [$353,521.26] from post and telegraphs). The chief expenditure was on the interest (£875,525 [$4,255,051.50]) and sinking fund (£122,873 [$597,162.78]) of the public debt. This debt amounted in 1887 to £21,202,570 [$103,044,490.20], of which by far the greater proportion (£18,966,700 [$92,178,162]) was incurred for constructing and buying railways. Most of it bears interest at 4 per cent.

Finance.

In terms of the convention of 1870 the troops of Würtemberg form the 13th army corps in the imperial German army. They include 8 regiments of infantry, 4 of cavalry, and 2 of field artillery, etc. By the army law of March 11, 1887, the peace strength of the army was fixed at 773 officers, 18,815 men, and 64 cannon. The town of Ulm is one of the strongest fortresses in Germany.

Army.

The earliest known inhabitants of the country now called Würtemberg seem to have been Snevi. The Romans, who appeared first about 15 B.C., added the south part of the land to the province of Gaul in 84 A.D., and defended their positions there by a wall or rampart. About the beginning of the 3d century the Alemanni drove the Romans beyond the Rhine and the Danube; but they in their turn were conquered by the Franks under Clovis (496), and the land was divided between Rhenish Franconia and the duchy of Alemannia. The latter, however, disappears about 760, and its territories were administered for the Frankish monarchs by "grafs" or counts, until they were finally absorbed in the duchy of Swabia. The last duke of Swabia died in 1268, and a large share of his power and possessions fell into the hands of the "grafs" of Würtemberg, whose ancestral castle crowned a hill between Esslingen and Cannstatt. Tradition mentions a Conradus de Wirtemberc in 1090, but the earliest authentic count seems to have been Ulrich (1241–1265), who had large possessions in the valleys of the Neckar and the Rems. The power of this family grew steadily under successive counts; and in 1482 their possessions were declared indivisible. This early adoption of the principle of primogeniture saved Würtemberg from the wasting effects of those family feuds and jealousies which interfered so seriously with the development of some of the other German states. Eberhard V., surnamed "im Bart" (1482–1496),

History.

was one of the most energetic and illustrious rulers that Würtemberg ever had, and in 1495 his possessions were raised by the emperor to the dignity of an immediate imperial duchy. The reigu of Ulrich I. (1498–1550), who succeeded to the duchy while still a child, was a most eventful period for the country, and many stories and traditions cluster round the name of this gifted and vigorous but unscrupulous and ambitious man. The extortions by which he sought to raise money for his extravagant pleasures excited a rising known as the "arme Konrad" (poor Conrad)—not unlike the rising of Wat Tyler in England; and by the treaty of Tübingen in 1514 his people undertook to pay his debts in exchange for various political privileges, which in effect laid the foundation of the constitutional liberties of the country. A few years later, however, Ulrich quarrelled with the Swabian league of imperial towns, and their army headed by the duke of Bavaria, who was incensed by Ulrich's ill-treatment of his wife, a Bavarian princess, invaded Würtemberg, expelled the duke, and in 1520 sold the duchy to Austria for 220,000 florins [$558,800]. Ulrich, however, found his opportunity in the discontent caused in Würtemberg by the military and religious oppression of Austria, and in the disturbed state of the empire during the Peasants' War, and the commotions excited by the Reformation. Aided by Philip of Hesse and other Protestant princes, he fought a victorious battle at Lauffen in 1534; and by the treaty of Kadan he was recognized once more as duke, though forced to acknowledge his duchy a fief of Austria. One of his first acts was to introduce the Reformation, and to endow Protestant churches and schools throughout his land. His connection with the Schmalkaldian League once more cost him a temporary expulsion from his throne, but Charles V. reinstated him in 1547, though under severe conditions. Ulrich's son Christopher (1550–1568) introduced systems of law and church government (Grosse Kirchenordnung) which have endured in part to the present day. The establishment in this reign of a kind of standing committee to superintend the finances was the beginning of popular representation in the government, though its members belonged exclusively, of course, to the higher ranks. Frederick I. (1593–1608), an energetic and ambitious prince, induced the emperor Rudolph II. in 1599 to raise the duchy once more to the dignity of an immediate fief of the empire. In the reign of his successor, John Frederick (1608–1628), Würtemberg suffered severely from the Thirty Years' War, though the duke took no active share in that struggle. His son and successor, however, Eberhard III. (1628–1674), eagerly joined in it, but with disastrous effects. Würtemberg was occupied by imperial troops, the duke was driven into exile, and when the peace of Westphalia once more reinstated him he found but 50,000 subjects where he had left 400,000. In the reign of Eberhard IV. (1677–1733), who was but one year old when his father William died, Würtemberg made acquaintance with another destructive enemy. In 1688, 1692, 1703, and 1707 the French entered the country with fire and sword, annihilating whole villages in their ruthless brutality, and leaving deserts in their track. The depopulated country eagerly afforded a welcome and a home to the Waldensians, who had been driven from their valleys by the duke of Savoy in 1699. Charles Alexander, who became duke in 1733, had embraced the Roman Catholic faith when an officer in the Austrian service, while his favorite minister was the unscrupulous Jew Süss Oppenheimer. The duke, instigated by his minister, was believed to aim at the suppression of the diet, and at the introduction of the Romish faith, but Charles's sudden death in 1737 put an abrupt end to these plans. Süss Oppenheimer was hanged by the regent, before the next duke, Charles Eugene (1737–1793) came of age in 1744. The prince was gifted but vicious, and he soon fell into the hands of unworthy favorites. His whole reign was disturbed by dissensions betwixt the ruler and the ruled, in which the intervention of foreign powers (Prussia and England) was invoked, though in vain, by the unhappy people. Alarmed by the gathering discontent, Charles made a few concessions in his old age. Frederick Eugene (1795–1797), a brother of Charles Eugene, had been brought up at the court of Frederick the Great, whose niece he married. His children were, through this influence, educated as Protestants, and the royal family of Würtemberg have been Protestants since his death.

Frederick II. (1797–1816) resembled the first of his name in becoming embroiled with the diet. He declared war against France in defiance of the wishes of his people, and when the French invaded the country he retired to Erlangen, till after the peace of Lunéville (1801). By a private treaty at the same date, he exchanged Montbéliard (which had belonged to Würtemberg since 1418) and his Alsatian possessions for nine imperial towns and other territories, amounting in all to 850 square miles, with 124,000 inhabitants. He accepted also the title of elector from Napoleon. The newly acquired districts were not incorporated with his former possessions, but remained separate under the name "New Würtemberg." The new district had no diet. This was the first of a series of transactions with the national enemy, which swelled Frederick's territory, though they added but little to his credit. In 1805 Würtemberg took up arms on the side of France, and the elector was rewarded at the peace of Pressburg by various Austrian possessions in Swabia, and the title of king. On January 1, 1806, Frederick assumed the royal style, abrogated the constitution, and united old and new Würtemberg. He subsequently united church and state, and proclaimed religious equality. In 1806 King Frederick I. joined the Confederation of the Rhine, and received fresh territories, with 160,000 inhabitants; and the peace of Vienna brought 110,000 new subjects under his sceptre. But he had to perform his part of the bargain by joining Napoleon in his campaigns against Prussia, Austria, and Russia. Of 16,000 Würtembergers who marched to Moscow, only a few hundred returned. When fortune turned, Frederick with ready adroitness changed sides, and managed to preserve his royal title and most of his new-won lands by joining the allies immediately after the battle of Leipsic.

Würtemberg had been promised a constitution by Frederick before he died in 1816, but a good deal of discussion took place before it was granted in 1819 by William I. (1816–1864). A period of quiet now set in, and the educational condition of the kingdom, its agriculture, and its trade and manufactures began to receive earnest attention. The desire for political freedom had by no means been satisfied by the constitution of 1819, and a "liberal opposition" began to make itself felt about 1830. The agitation of 1848 did not leave Würtemberg undisturbed, though no scenes of actual violence took place in the kingdom. The conservative ministry granted freedom of the press and other privileges, too late, however, to avert their fall. The king was compelled to call the liberals to power in March, 1848, and a new liberal constitution was granted. But as soon as the stress was over the "March ministry" was dismissed, and the reactionary party were again in the ascendant. By a high-handed interference with recently granted popular rights on the part of the king and his ministers a servile diet was assembled in 1851, which yielded up without hesitation all that had been gained since 1848. The constitution of 1819 was reinstituted, and it has remained, with only a few modifications, ever since. In 1864 Charles ascended the throne. In the duel between Prussia and Austria for supremacy in Germany, the sympathies of the rulers of Würtemberg were always on the side of the latter, although the country entered the Customs Union under Prussia's protection in 1864. In 1866 Würtemberg took up arms on behalf of Austria; but the Würtemberg troops were defeated at Tauberbischofsheim, three weeks after Sadowa, and its ministers sued for peace. Prussia exacted an indemnity of 8 million florins [$3,224,000], and Würtemberg struck a secret offensive and defensive treaty with its conqueror. In 1870 this kingdom shared in the national enthusiasm which swept over Germany when France declared war; and its troops had a creditable share in the memorable campaign of 1870–71. Since the foundation of the present German empire, the separate history of Würtemberg has been of almost exclusively local interest. The tendency of legislation has been, on the whole, liberal.

A very full and minute description of Würtemberg together with copious lists of authorities on all subjects connecte with it, will be found in *Das Königreich Württemberg*, Stuttgart, 1882 *sq.*, officially published by the Königliches Statistisch-Topographisches Bureau. (F. MU.)

WURTZ, Charles Adolphe (1817–1884), chemist, was born at Strasburg on November 26, 1817. His father, Jean Jacques Wurtz, was then Lutheran pastor at the small village of Wolfisheim near Strasburg. His mother, Sophie Kreiss, was the sister of Theodore Kreiss, professor of Greek at the Protestant gymnasium of Strasburg, and of Adolphe Kreiss, a Lutheran pastor. When Wurtz was nine years old his father was translated to the church of St. Pierre le Jeune in Strasburg, and died there in 1845. Madame Wurtz, after the death of her husband, remained at Strasburg with her brother Theodore, and after his death lived with her son Adolphe in Paris till her own death in 1878.

Wurtz was educated first at Wolfisheim and afterwards at the Protestant gymnasium of Strasburg. There he obtained several prizes, but seems rather to

have disappointed his father, who said he would never turn out anything extraordinary. He took special interest in those studies which bore upon nature; in 1828 he took part in a botanical class with excursions, which developed his taste for natural science.

His education owed more perhaps to his home circle than to the school. His learned and pious father, his more generally cultured uncles, and the circle of friends attracted by them opened to him a wide view of what there is for a man to know. His holidays were mostly spent at the house of a grand-aunt at Rothau, where he learned to know the hills and woods of Alsace, and amused himself in the spinning, weaving, bleaching, and printing works in the neighborhood. In 1834 he left the gymnasium with the degree of bachelier-ès-lettres. His father seems to have wished him to devote himself to the church. But he had already made his choice. For some time he had fitted up a sort of laboratory in the washing-house, and had there repeated the experiments he had seen performed in the class-rooms of the gymnasium. His father took no interest in science, but consented to his study of medicine as next best to theology. He went through his studies conscientiously, and passed all his examinations with credit, but of course devoted himself specially to the chemical side of his profession. In 1839 he was appointed superintendent of practical chemistry in the faculty of medicine under Professor Cailliot. He graduated as M.D. 13th August, 1843, the title of his thesis being "On Albumin and Fibrin." He then went for a year to Giessen, to study under Liebig. There he made the acquaintance of Hofmann, Strecker, and Kopp. On leaving Giessen he went to Paris, where he worked in Dumas's private laboratory, and in 1845 was appointed assistant to Dumas in the École de Médecine. In 1847, on his presentation of a thesis "On Pyrogenic Bodies," he was appointed "professor aggrégé," and in 1849 he gave the lectures on organic chemistry in place of Dumas. His laboratory in the Ecole Pratique de la Faculté de Médecine was very inconvenient and ill fitted up; he therefore, in 1850, along with Dollfus and Verdeil, who had just returned to Paris from Giessen, opened a private laboratory in the Rue Garancière. The adventure was successful in a scientific sense as long as it lasted; but, unfortunately the three chemists had neglected to secure fixity of tenure, the house was sold, and they had to retire and sell their furnishings. The same year Wurtz was appointed professor of chemistry in the Institut Agronomique, then founded at Versailles. But here also the want of fixity was felt. Louis Napoleon abolished the Institut in 1852. In 1853 Dumas resigned the chair of organic chemistry in the faculty of medicine; at the same time the chair of mineral chemistry and toxicology became vacant by the death of Orfila; the two chairs were united, and Wurtz was appointed to the post thus constituted. In 1866 he was made dean of the faculty of medicine, and used his influence for the rearrangement and reconstruction of the buildings devoted to scientific teaching. In 1874 he persuaded the Government to found a chair of organic chemistry at the Sorbonne, and resigned his office of dean, retaining the title of honorary dean. At the Sorbonne he had a smaller but better prepared audience than at the École de Médecine. But he had great difficulty in persuading the Government to build him a suitable laboratory, and indeed did not live to see the new laboratory opened. He was appointed senator in 1881. He was one of the founders of the Chemical Society of Paris, of which he was the first secretary, and was three times president. He was elected member of the Academy of Sciences in 1867, in succession to Pelouze. He was vice-president in 1880 and president in the following year. He died, after a short illness, May 12, 1884. Wurtz was an honorary member of nearly every scientific society in Europe. In 1878 he gave the Faraday lecture of the Chemical Society of London, and in 1881 was awarded the Copley medal by the Royal Society of London. Through life he remained warmly attached to the church of his fathers, and took a practical interest in its affairs.

Wurtz's work is chiefly to be found in the *Annales de Chimie et de Physique*, in the *Comptes Rendus*, and in the *Bulletin de la Société Chimique*. The following is a short outline of his most important discoveries. First, with respect to the constitution of hypophosphorous and phosphorous acids, he showed that the salts of these acids all contain the elements of water, and proposed formulæ for them, in which the salt radical is represented as containing hydrogen. These formulæ, translated, of course, into the modern language, which Wurtz did so much to introduce, are still used as the best representations of the constitution of these salts. In the course of this investigation he discovered the curious and interesting compound cuprous hydride. He also discovered sulphophosphoric acid and the oxychloride of phosphorus. His next great work was on cyanuric acid. He discovered the cyanic ethers ($R-N=C=O$), and from them obtained the mono-alkyl ureas. From the cyanic ethers he produced a class of substances which opened the way into a new field of organic chemistry. On treating these ethers with caustic potash he obtained potassium carbonate and ammoniacal vapor. These vapors he soon recognized as ammonia, in which an equivalent of hydrogen had been replaced by methylium, CH_3, or ethylium, C_2H_5. By acting on the cyanic ethers with his new bases he obtained the dialkyl ureas. In 1855 he reviewed the various substances that had been obtained from glycerin, and came to the conclusion that glycerin is a body of alcoholic nature formed on the type of three molecules of water, as common alcohol is on that of one. This speculation led him in 1856 to the discovery of the glycols, alcoholic bodies similarly related to the type of two molecules of water. This discovery he worked out very thoroughly, in investigations on oxide of ethylene and the polyethylenic alcohols. The oxidation of the glycols led him to homologues of lactic acid, and to a discussion of the constitution of the latter. On this question a controversy arose with Kolbe, in the course of which many important facts were discovered, and valuable additions were made to chemical theory. In 1867 Wurtz obtained neurine synthetically, by the action of trimethylamine on glycol-chlorhydrine. In 1873 he discovered aldol, $CH_3-CH(OH)-CH_2-CHO$, and pointed out its double character as at once an alcohol and an aldehyde.

His investigations on the olefines had led him to the discovery of the peculiar behavior of the substance called by him chlorhydrate of amylene and of its analogues, when the temperature of their vapor is raised. The gradual passage from a gas of approximately normal vapor density to one of half the normal density was used by him as a powerful argument in favor of the opinion that abnormal vapor densities, such as those of sal-ammoniac and pentachloride of phosphorus, are to be explained by dissociation. By experiments at low temperatures and pressures he obtained nearly the normal density in the case of the pentachloride of phosphorus, and showed how the dissociation depends on the temperature and pressure. He took an active part in the discussion as to the dissociation of the vapor of hydrate of chloral, in which H. Sainte-Claire Deville and M. Berthelot were his chief opponents. By well-chosen experiments he brought to light the facts involved, and stated the case for dissociation in a very clear and to most minds very convincing way.

Wurtz for twenty years, from 1852 to 1872, published in the *Annales de Chimie et de Physique* abstracts of chemical work done out of France. In 1868 he began, with the assistance of many French chemists, the publication of the *Dictionnaire de Chimie Pure et Appliquée*. This great work, many important articles in which were written by himself, was finished in 1878. (Two volumes of appendix have since been added.) In 1864 he published a book in two volumes entitled *Chimie Médicale*, and in 1867 *Leçons Élémentaires de Chimie Moderne*, an excellent little text-book which has gone through five editions in French, and has been translated into English by Prof. Greene. In 1879 appeared his *Théorie Atomique*, and in 1885 *Traité de Chimie Biologique*. This was his last work; he corrected the last proof-sheets himself, and the last part of the book was published a few weeks after his death.

A full account of the life and work of Wurtz, with a list of his published books and papers, will be found in the obituary notice by M. Friedel in the *Bulletin de la Société Chimique*, vol. xliii., i.-lxxx., 1885. (A. C. B.)

WÜRZBURG, or WIRZBERG, the fourth largest town in Bavaria, and the chief town of the district of Lower Franconia in the northwest of that kingdom, is

situated on both sides of the Main, 60 miles southeast of Frankfort. An ancient stone bridge (1474–1607), 650 feet long, and adorned with statues of saints, connects the two parts of the town. Würzburg is quaintly and irregularly built; many of the houses are interesting specimens of mediæval antiquity; and the numerous old churches recall the fact that it was long the capital of an ecclesiastical principality. The principal church is the imposing Romanesque cathedral, a basilica with transepts, begun in 1042 and consecrated in 1189. The four towers, however, date from 1240, the (rococo) façade from 1711–19, and the dome from 1731. The spacious transepts terminate in apses. The beautiful Marienkapelle, a Gothic edifice of 1377–1441, was restored in 1856; it is embellished with fourteen statues by Tilman Riemenschneider, who died at Würzburg in 1531. The Stifthaug church, with two towers and a lofty dome, was built in the Italian Renaissance style in 1670–91. The bones of St. Kilian, patron saint of Würzburg, are preserved in the Neumünster church, which dates from the 11th century; Walther von der Vogelweide is buried in the adjoining cloisters. The church of St. Burkhard is externally one of the best preserved architectural monuments in the city. It was built in 1033–42, in the Romanesque style, and was restored in 1168. The Late Gothic choir dates from 1494–97. The Neubaukirche, or university church, curiously unites a Gothic exterior with a Classical interior. The Protestant church of St. Stephen (1782–89) originally belonged to a Benedictine abbey. Of the secular buildings in Würzburg the most conspicuous is the royal (formerly episcopal) palace, a huge and magnificent edifice built in 1720–44 in imitation of Versailles. The Julius hospital, a large and richly endowed institution affording food and lodging to 600 persons daily, was founded in 1576 by Bishop Julius Echter von Mespelbrunn. The quaint townhouse dates in part from 1456. Among the other chief buildings are the Government offices, the theatre, the Maxschule, the observatory, and the various university buildings. A university was founded at Würzburg in 1403, but only existed for a few years. The present university was founded by Bishop Julius in 1582. Owing to its connection with the large hospital, its laboratories, and its rich anatomical collections, the medical faculty speedily became famous, and has remained the most important faculty at Würzburg ever since. The university library contains 200,000 volumes, and there are numerous scientific institutes connected with the main institution. In 1886 it was attended by 800 students (600 medical), and had a teaching staff of 70 professors and lecturers. The other educational establishments of Würzburg are numerous; among them is a music institute, which gives instruction gratis in vocal and instrumental music.

Würzburg is surrounded by vineyards, which yield some of the best wines in Germany; it also carries on the manufacture of beer, leather, tobacco, and railway carriages. The environs are highly picturesque as well as fertile; the most interesting point is the Leistenburg, on which stands the fortress of Marienburg, the residence of the bishops until 1720. This position was occupied by a Roman fort, and seems to have been fortified by Bishop Conrad, who died in 1203. The population of Würzburg in 1885 was 55,100, of whom 9000 were Protestants.

Würzburg is one of the most ancient and interesting towns of Germany, and as the capital of an immediate episcopal principality long played an important part in the history of the empire. The first bishop was Burkard, consecrated in 741, though the town seems to have existed in the previous century. The bishops soon acquired a considerable share of temporal power, and in the 15th century enjoyed the title of dukes of East Franconia. The citizens of Würzburg espoused the cause of Henry IV. against their bishop, and in 1086 the town was twice taken by the contending armies. Various imperial diets were held in Würzburg, the chief being those of 1180, when Henry the Lion was placed under the ban, and of 1209, when Otto IV. was betrothed. In 1525 the rebellious peasants under Götz von Berlichingen took the town, but were repulsed from the Marienburg, and were defeated with great slaughter by the Swabian forces. The bishopric, which at one time embraced an area of 190 square miles, with 250,000 inhabitants, was secularized at the peace of Lunéville, and passed to Bavaria in 1803. The peace of Pressburg (1805) transferred it, under the name of an electorate, to the grand-duke of Tuscany, who joined the Confederation of the Rhine, assuming the title grand-duke of Würzburg. The congress of Vienna restored it to Bavaria. Archduke Charles defeated Marshal Jourdan near Würzburg in 1796; and in 1866 the bombarding of the citadel was the last warlike act of the Prussian army of the Main. The Würzburg conference is the name given to the meeting of the representatives of the smaller German states in November, 1859, to devise some means of mutual support in the imperial diet. *Wircebirgum* is the old Latin form of the name of the town; *Herbipolis* (herb-town; Wurz is the German for root or herb) appears in the 12th century.

WYANDOTTE, formerly a city and the county seat of Wyandotte county, Kansas, United States, had in 1886 a population of 13,840. In that year Armourdale (2634) and Kansas City, Kansas (4755), were consolidated with Wyandotte under the name of Kansas City, Kansas. The city is situated upon the west bank of the Missouri river and north bank of the Kansas river, in eastern Kansas, immediately adjoining the State line, and separated by it from Kansas City, Missouri. The surrounding country is a fertile and highly cultivated prairie. The city is intersected by several railroads, most of which are branches of the Missouri Pacific system. It is rather irregularly laid out, being an aggregation of independent settlements, and its municipal improvements are in a formative stage. The population in 1886 was 21,229 (about 16 per cent. of foreign birth and 20 per cent. colored). Kansas City is the third in the State in point of population.

WYAT, Sir Thomas (1503–1542), is an important figure historically in English literature, although his poetry does not rank very high in intrinsic value. He was undoubtedly the leader, the first in point of time, and the acknowledged master of "the company of courtly makers" who in the reign of Henry VIII., under Italian influence, transformed the character of English poetry. Surrey (*q.v.*) is usually associated with Wyat in this leadership, and his influence was probably greater, as his verse was superior in fluency, dexterity, and force. But the priority, the actual lead, undoubtedly belongs to Wyat, who was Surrey's senior by fourteen years, and was celebrated by the younger poet with all the homage of an enthusiastic disciple. That there should ever have been any doubt upon the point arises from the fact that their poems were not printed till several years after both were dead, that they were then printed together in the same collection (*Tottel's Miscellany*, 1557), and that Surrey's name was placed first on the title-page by the publisher, while his poems preceded Wyat's in the *Miscellany*. It is to Wyat that the praise rightfully belongs of being the first writer of sonnets in English. He is also our first writer of satires in the classical form. Apart from the question of their services as pioneers of new metres and a new vein of love sentiment, there is a wide difference in character between Surrey and Wyat. Their poetry strongly corroborates the evidence of their portraits by Holbein. Wyat is much less bright and radiant, of a grave, sedate cast, with a vein of humorous melancholy and satiric observation. It is not known for certain that Wyat ever travelled in Italy, but the probability that he did so is strong. Wyat's father, Sir Henry, the owner of Allington castle in Kent, was a prominent figure at the court of Henry VII., and a residence at one of the Italian courts was then a usual part of the education of a young man of rank. Wyat was born in 1503, and we have no record of him between his taking his bachelor's degree at Cambridge at the age

of fifteen and his being sworn a member of the privy council at the age of thirty, except that he took part in the tournament at a great feast held by the king at Greenwich in 1525. He was knighted in 1536, and twice sent as ambassador to the emperor, a strong proof of his repute as a statesman and diplomatist. He died in 1542, in the course of a hurried journey to Falmouth to meet and convoy an ambassador from the emperor. Wyat is commonly known as Sir Thomas Wyat the elder, to distinguish him from his son of the same name, who headed an insurrection against Mary in 1554, and paid the penalty of failure.

WYATT, James (1743–1813), a popular architect, born in Staffordshire in 1743,[1] who lived at a time when architectural taste was at its lowest ebb. He spent some time in Rome making measured drawings of the classical remains, and on his return to England became one of the most successful architects of his time, and eventually was elected president of the Royal Academy. On the death of Sir William Chambers in 1796, Wyatt was appointed surveyor to the Board of Works. His chief works were a number of buildings at Kew, for George III., all in the worst taste, and Fonthill Abbey for the rich and eccentric Mr. Beckford, author of *Vathek*. This enormous and costly mansion, a sort of theatrical parody of a Gothic abbey, was erected in an incredibly short space of time by relays of workmen laboring day and night. The massive and lofty tower collapsed soon after it was finished, and a great part of this extravagant architectural freak has since been pulled down. James Wyatt was killed by a fall from his carriage in 1813.

WYCHERLEY, William (*c.* 1640–1715), the typical "Restoration dramatist," and one of the greatest masters of the comedy of repartee, was born about 1640 at Clive, near Shrewsbury, where for several generations his family had been settled on a moderate estate of about £600 [$3309] a year. Like Vanbrugh, Wycherley spent his early years in France, whither, at the age of fifteen, he was sent to be educated in the very heart of the "precious" circle who disported on the banks of the Charente. Wycherley's friend, Major Pack, tells us that his hero "improved, with the greatest refinements," the "extraordinary talents," for which he was "obliged to nature." Although the harmless affectations of the Rambouillets and Montausiers, among whom he was thrown, are certainly not chargeable with the "refinements" of Wycherley's comedies—comedies which caused even his great admirer Voltaire to say afterwards of them, "Il semble que les Anglais prennent trop de liberté et que les Françaises n'en prennent pas assez"—these same affectations seem to have been much more potent in regard to the "refinements" of Wycherley's religion.

Wycherley, though a man of far more intellectual power than is generally supposed, was a fine gentleman first, a responsible being afterwards. Hence under the manipulations of the heroine of the "Garland" he turned from the Protestantism of his fathers to Romanism—turned at once, and with the same easy alacrity as afterwards, at Oxford, he turned back to Protestantism under the manipulations of such an accomplished master in the art of turning as Bishop Barlow. And if, as Macaulay hints, Wycherley's turning back to Romanism once more had something to do with the patronage and unwonted liberality of James II., this merely proves that the deity he worshipped was the deity of the "polite world" of his time—gentility. Moreover as a professional fine gentleman, at a period when, as the genial Major Pack says, "the amours of Britain would furnish as diverting memoirs, if well related, as those of France published by Rabutin, or those of Nero's court writ by Petronius," Wycherley was obliged to be a loose liver. But, for all that, Wycherley's sobriquet of "Manly Wycherley" seems to have been fairly earned by him, earned by that frank and straightforward way of confronting life which, according to Pope and Swift, characterized also his brilliant successor Vanbrugh.

That effort of Wycherley's to bring to Buckingham's notice the case of Samuel Butler (so shamefully neglected by the court Butler had served) shows that the writer of even such heartless plays as *The Country Wife* may be familiar with generous impulses, while his uncompromising lines in defence of Buckingham, when the duke in his turn fell into trouble, show that the inventor of so shameless a fraud as that which forms the pivot of *The Plain Dealer* may in actual life possess that passion for fair play which is believed to be a specially English quality. But among the "ninety-nine" religions with which Voltaire accredited England there is one whose permanency has never been shaken—the worship of gentility. To this Wycherley remained as faithful to the day of his death as Congreve himself. And, if his relations to that "other world beyond this," which the Puritans had adopted, were liable to change with his environments, it was because that "other world" was really out of fashion altogether.

Wycherley's university career seems also to have been influenced by the same causes. Although Puritanism had certainly not contaminated the universities, yet English "quality and politeness" (to use Major Pack's words) have always since the great rebellion, been rather ashamed of possessing too much learning. As a fellow commoner of Queen's College, Oxford, Wycherley only lived (according to Wood) in the provost's lodgings, being entered in the public library under the title of "Philosophiæ Studiosus" in July, 1660. And he does not seem to have matriculated or to have taken a degree.

Nor when on quitting Oxford, he entered himself of the Middle Temple, did he give any more attention to the dry study of the law than was proper to one so warmly caressed "by the persons most eminent for their quality or politeness." Pleasure and the stage were alone open to him, and in 1672 was produced at the Theatre Royal, *Love in a Wood*. With regard to this comedy Wycherley told Pope—told him "over and over" till Pope believed him—believed him, at least, until they quarrelled about Wycherley's verses—that he wrote it the year before he went to Oxford. But we need not believe him: the worst witness against a man is mostly himself. To pose as the wicked boy of genius has been the foolish ambition of many writers, but on inquiry it will generally be found that these inkhorn Lotharios are not nearly so wicked as they would have us believe. When Wycherley charges himself with having written as a boy of nineteen, scenes so callous and so depraved that even Barbara Palmer's appetite for profligacy was, if not satisfied, appeased, there is, we repeat, no need to believe him. Indeed there is every reason to disbelieve him,—not for the reasons advanced by Macaulay, however, who in challenging Wycherley's date does not go nearly deep enough. Macaulay points to the allusions in the play to gentlemen's periwigs, to guineas, to the vests which Charles ordered to be worn at court, to the great fire, etc., as showing that the comedy could not have been written the year before the author went to Oxford. We must, remember, however, that even if the play had been written in that year, and delayed in its production till 1672, it is exactly this kind of allusion to recent events which any dramatist with an eye to freshness of color would be certain to weave into his dialogue. It is not that "the whole air and spirit of the piece belong to a period subsequent to that mentioned by Wycherley," but that "the whole air and spirit of the piece" belong to a man,—an experienced and hardened young man of the world,—and not to a boy who would fain pose as an experienced and hardened young man of the world. The real defence of Wycherley against his foolish impeachment of himself is this, that *Love in a Wood*, howsoever inferior in struc-

[1] [This date is usually given as 1746.—Am. Ed.]

ture and in all the artistic economies to *The Country Wife* and *The Plain Dealer*, contains scenes which no inexperienced boy could have written—scenes which, not for moral hardness merely, but often for real dramatic ripeness, are almost the strongest to be found amongst his four plays. With regard to dramatic ripeness, indeed, if we were asked to indicate the finest touch in all Wycherley, we should very likely select a speech in the third scene of the third act of this very play, where the vain, foolish, and boastful rake, Dapperwit, having taken his friend to see his mistress for the express purpose of advertising his lordship over her, is coolly denied by her and insolently repulsed. "I think," says Dapperwit, "women take inconstancy from me worse than from any man breathing."

Now, does the subsequent development of Wycherley's dramatic genius lead us to believe that, at nineteen, he could have given this touch, worthy of the hand that drew Malvolio? Is there anything in his two masterpieces—*The Country Wife* or *The Plain Dealer*—that makes it credible that Wycherley, the boy, could have thus delineated by a single quiet touch vanity as a chain-armor which no shaft can pierce—vanity, that is to say, in its perfect development? However, Macaulay (forgetting that, among the myriad vanities of the writing fraternity, this of pretending to an early development of intellectual powers that ought not to be, even if they could be, developed early is at once the most comic and the most common) is rather too severe upon Wycherley's disingenuousness in regard to the dates of his plays. That the writer of a play far more daring than Etheredge's *She Would if She Could*—and far more brilliant too—should at once become the talk of Charles's court was inevitable; equally inevitable was it that the author of the song at the end of the first act, in praise of harlots and their offspring, should touch to its depths the soul of the duchess of Cleveland. Possibly Wycherley intended this famous song as a glorification of Her Grace and her profession, for he seems to have been more delighted than surprised when, as he passed in his coach through Pall Mall, he heard the duchess address him from her coach window as a "rascal," a "villain," and as a son of the very kind of lady his song had lauded. For his answer was perfect in its readiness: "Madam, you have been pleased to bestow a title on me which belongs only to the fortunate." Perceiving that Her Grace received the compliment in the spirit in which it was meant, he lost no time in calling upon her, and was from that moment the recipient of those "favors" to which he alludes with pride in the dedication of the play to her. Voltaire's story (in his *Letters on the English Nation*) that Her Grace used to go to Wycherley's chambers in the Temple disguised as a country wench, in a straw hat, with pattens on and a basket in her hand, may be apocryphal,—very likely it is,—for disguise was quite superfluous in the case of the mistress of Charles II. and Jacob Hall,—but it at least shows how general was the opinion that, under such patronage as this, Wycherley's fortune as poet and dramatist, "eminent for his quality and politeness," was now made.

Charles, who had determined to bring up his son, the duke of Richmond, like a prince, was desirous of securing for tutor a man so entirely qualified as was Wycherley to impart what was then recognized as the princely education, and it seems pretty clear that, but for the accident, to which we shall have to recur, of his meeting the countess of Drogheda at Bath and secretly marrying her, the education of the young man would actually have been entrusted by his father to Wycherley as a reward for the dramatist's having written *Love in a Wood*.

Whether Wycherley's experiences as a naval officer, which he alludes to in his lines "On a Sea Fight which the author was in betwixt the English and the Dutch," occurred before or after the production of *Love in a Wood* is a point upon which opinions differ, but on the whole we are inclined to agree with Macaulay, against Leigh Hunt, that these experiences took place not only after the production of *Love in a Wood* but after the production of *The Gentleman Dancing Master*, in 1673. We also think, with Macaulay, that he went to sea simply because it was the "polite" thing to do so—simply because, as he himself in the epilogue to *The Gentleman Dancing Master* says, "all gentlemen must pack to sea."

This second comedy is inferior to *Love in a Wood*, and for the reasons already discussed in connection with the works of another dramatist (see VANBRUGH). In *The Relapse*, however, the artistic mistake of blending comedy and farce damages a splendid play, but leaves it a splendid play still. In *The Gentleman Dancing Master* this mingling of discordant elements destroys a play that would never under any circumstances have been strong,—a play nevertheless which abounds in animal spirits, and is luminous here and there with true dramatic points.

It is, however, on his two last comedies—*The Country Wife* and *The Plain Dealer*—that must rest Wycherley's fame as a master of that comedy of repartee which, inaugurated by Etheredge, and afterwards brought to perfection by Congreve and Vanbrugh, supplanted the humoristic comedy of the Elizabethans. *The Country Wife*, produced in 1675, is so full of wit, ingenuity, animal spirits, and conventional humor that, had it not been for its motive—a motive which in any healthy state of society must always be as repulsive to the most lax as to the most moral reader—it would probably have survived as long as the acted drama remained a literary form in England. So strong, indeed, is the hand that could draw such a character as Marjory Pinchwife (the undoubted original not only of Congreve's Miss Prue but of Vanbrugh's Hoyden), such a character as Sparkish (the undoubted original of Congreve's Tattle), such a character as Horner (the undoubted original of all those cool impudent rakes with whom our stage has since been familiar), that Wycherley is certainly entitled to a place alongside Congreve and Vanbrugh. And, indeed, if priority of date is to have its fair and full weight, it seems difficult to challenge Prof. Spalding's dictum that Wycherley is "the most vigorous of the set."

In order to do justice to the life and brilliance of *The Country Wife* we have only to compare it with *The Country Girl*, afterwards made famous by the acting of Mrs. Jordan, that Bowdlerized form of *The Country Wife* in which Garrick, with an object more praiseworthy than his success, endeavored to free it of its load of unparelleled licentiousness by disturbing and sweetening the motive,—even as Voltaire afterwards (with an object also more praiseworthy than his success) endeavored to disturb and sweeten the motive of *The Plain Dealer* in *La Prude*. While the two Bowdlerized forms of Garrick and Voltaire are as dull as the *Æsop* of Boursault, the texture of Wycherley's scandalous dialogue would seem to scintillate with the changing hues of shot silk or of the neck of a pigeon or of a shaken prism, were it not that the many-colored lights rather suggest the miasmatic radiance of a foul ditch shimmering in the sun. It is easy to share Macaulay's indignation at Wycherley's satyr-like defilement of art, and yet, at the same time, to protest against that disparagement of their literary riches which nullifies the value of Macaulay's criticism. And scarcely inferior to *The Country Wife* is *The Plain Dealer*, produced in 1677,—a play of which Voltaire said, "Je ne connais point de comédie chez les anciens ni chez les moderns ou il y ait autant d'esprit." Strong language, no doubt; but Voltaire has prevented it from seeming too strong by turning the play into *La Prude*, and offering us in that a subject for comparison. No one has pointed out the immense influence of this comedy, as regards manipulation of dialogue, upon all our subsequent comedies of repartee, from those of Congreve and Vanbrugh to those of Douglas Jerrold

and T. W. Robertson ; and, as to characters, he who wants to trace the ancestry of Tony Lumpkin and Mrs. Hardcastle has only to turn to Jerry Blackacre and his mother, while Manly (for whom Wycherley's early patron, the duke of Montausier, sat), though he is perhaps overdone, has dominated this kind of stage character ever since. If but few readers know how constantly the blunt sententious utterances of this character are reappearing, not on the stage alone, but in the novel and even in poetry, it is because a play whose motive is monstrous and intolerable can only live in a monstrous and intolerable state of society ; it is because Wycherley s genius was followed by Nemesis, who always dogs the footsteps of the defiler of literary art. When Burns said—

> "The rank is but the guinea stamp
> The man's the gowd for a' that,"

when Sterne, in *Tristram Shandy*, said, "Honors, like impressions upon coin, may give an ideal and local value to a bit of base metal, but gold and silver will pass all the world over without any other recommendation than their own weight," what did these writers do but adopt—adopt without improving—Manly's fine saying to Freeman, in the first act : "I weigh the man, not his title ; 'tis not the king's stamp can make the metal better or heavier"? And yet it is in the fourth and fifth acts that the coruscations of Wycherley's comic genius are the most dazzling ; also, it is there that the licentiousness is the most astonishing. Not that the worst scenes in this play are really more wicked than the worst scenes in Vanbrugh's *Relapse*, but they are more seriously imagined. Being less humorous than Vanbrugh's scenes, they are more terribly and earnestly realistic ; therefore they seem more wicked. They form indeed a striking instance of the folly of the artist who selects a story which cannot be actualized without hurting the finer instincts of human nature. When Menander declared that, having selected his plot, he looked upon his comedy as three parts finished, he touched upon a subject which all workers in drama—all workers in imaginative literature of every kind—would do well to consider. In all literature—ancient and modern—an infinite wealth of material has been wasted upon subjects that are unworthy, or else incapable, of artistic realization ; and yet Wycherley's case is, in our literature at least, without a parallel. No doubt it may be right to say, with Aristotle, that comedy is an imitation of bad characters, but this does not mean that in comedy art may imitate bad characters as earnestly as she may imitate good ones,—a fact which Thackeray forgot when he made Becky Sharp a murderess, thereby destroying at once what would otherwise have been the finest specimen of the comedy of convention in the world. And perhaps it was because Vanbrugh was conscious of this law of art that he blended comedy with farce. Perhaps he felt that the colossal depravity of intrigue in which the English comedians indulged needs to be not only warmed by a superabundance of humor but softened by the playful mockery of farce before a dramatic circle such as that of the Restoration drama can be really brought within human sympathy. Plutarch's impeachment of Aristophanes, which affirms that the master of the Old Comedy wrote less for honest men than for men sunk in baseness and debauchery, was no doubt unjust to the Greek poet, one side of whose humor, and one alone, could thus be impeached. But does it not touch all sides of a comedy like Wycherley's—a Comedy which strikes at the very root of the social compact upon which civilization is built? As to comparing such a Comedy as that of the Restoration with the Comedy of the Elizabethans, Jeremy Collier did but a poor service to the cause he undertook to advocate when he set the occasional coarseness of Shakespeare alongside the wickedness of Congreve and Vanbrugh. And yet, ever since Macaulay's essay, it has been the fashion to speak of Collier's attack as being levelled against the immorality of the "Restoration dramatists." It is nothing of the kind. It is (as was pointed out so long ago as 1699 by Dr. Drake in his little-known vigorous reply to Collier) an attack upon the English drama generally, with a special reference to the case of Shakespeare. While dwelling upon that noxious and highly immoral play *Hamlet*, Collier actually leaves unscathed the author of *The Country Wife*, but fastens on Congreve and Vanbrugh, whose plays—profligate enough in all conscience—seem almost decent beside a comedy whose incredible *vis motrix* is "the modish distemper."

That a stage, indeed, upon which was given with applause *A Woman Killed with Kindness* (where a wife dies of a broken heart for doing what any one of Wycherley's married women would have gloried in doing) should, in seventy years, have given with applause *The Country Wife* shows that in historic and social evolution, as in the evolution of organisms, "change" and "progress" are very far from being convertible terms. For the barbarism of the society depicted in these plays was, in the true sense of the word, far deeper and more brutal than any barbarism that has ever existed in these islands within the historic period. If civilization has any meaning at all for the soul of man, the Englishmen of Chaucer's time, the Anglo-Saxons of the Heptarchy, nay, those half-naked heroes, who in the dawn of English history clustered along the southern coast to defend it from the invasion of Cæsar, were far more civilized than that "race gangrenée"—the treacherous rakes, mercenary slaves, and brazen strumpets of the court of Charles II., who did their best to substitute for the human passion of love (a passion which was known perhaps even to palæolithic man) the promiscuous intercourse of the beasts of the field. Yet Collier leaves Wycherley unassailed, and classes Vanbrugh and Congreve with Shakespeare!

It was after the success of *The Plain Dealer* that the turning-point came in Wycherley's career. The great dream of all the men about town in Charles's time, as Wycherley's plays all show, was to marry a widow, young and handsome, a peer's daughter if possible,—but in any event rich, and spend her money upon wine and women. While talking to a friend in a bookseller's shop at Tunbridge, Wycherley heard *The Plain Dealer* asked for by a lady who, in the person of the countess of Drogheda, answered all the requirements. An introduction ensued, then love-making, then marriage—a secret marriage, for, fearing to lose the king's patronage and the income therefrom, Wycherley still thought it politic to pass as a bachelor. He had not seen enough of life to learn that in the long run nothing is politic but "straightforwardness." Whether because his countenance wore a pensive and subdued expression, suggestive of a poet who had married a dowager countess and awakened to the situation, or whether because treacherous confidants divulged his secret, does not appear, but the news of his marriage oozed out,—it reached the royal ears, and deeply wounded the father anxious about the education of his son. Wycherley lost the appointment that was so nearly within his grasp,—lost indeed the royal favor forever. He never had an opportunity of regaining it, for the countess seems to have really loved him, and *Love in a Wood* had proclaimed the writer to be the kind of husband whose virtue prospers best when closely guarded at the domestic hearth. Wherever he went the countess followed him, and when she did allow him to meet his boon companions it was in a tavern in Bow Street opposite to his own house, and even there under certain protective conditions. In summer or in winter he was obliged to sit with the window open and the blinds up, so that his wife might see that the party included no member of a sex for which her husband's plays had advertised his partiality. She died at last, however, and left him the whole

of her fortune. But the title to the property was disputed; the costs of the litigation were heavy—so heavy that his father was unable (or else he was unwilling) to come to his aid; and the result of his marrying the rich, beautiful, and titled widow was that the poet was thrown into the Fleet prison. There he languished for seven years, being finally released by the liberality of James II.,—a liberality which, incredible as it seems, is too well authenticated to be challenged. James had been so much gratified by seeing *The Plain Dealer* acted that, finding a parallel between Manly's "manliness" and his own, such as no spectator had before discovered, he paid off Wycherley's execution creditor. Other debts still troubled Wycherley, however, and he never was released from his embarrassments, not even after succeeding to a life estate in the family property. In coming to Wycherley's death, we come to the worst allegation that has ever been made against him as a man and as a gentleman. At the age of seventy-five he married a young girl, and is said to have done so in order to spite his nephew, the next in succession, knowing that he himself must shortly die and that the jointure would impoverish the estate. No doubt it is true enough that he did marry the girl and did die eleven days afterwards; but, if we consider that the lady he married was young and an heiress (or was supposed to be an heiress), and if we further consider how difficult it was for an old gallant of Wycherley's extraordinary personal vanity to realize his true physicial condition, we may well suppose that, even if he talked about "marrying to spite his nephew," he did so as a cloak for other impulses, such as senile desire or senile cupidity, or a blending of these impulses.

Wycherley wrote verses, and, when quite an old man, prepared them for the press by the aid of Alexander Pope, then not much more than a boy. But, notwithstanding all Pope's tinkering, they remain contemptible. He died in December, 1715, and was buried in the vault of the church in Covent Garden.

(T. W.)

WYCLIFFE,[1] or WYCLIF, JOHN (*c.* 1320–1384), was born, according to Leland,[2] our single authority on the point, at Ipreswel (evidently the place now called Hipswell), a mile from Richmond, in Yorkshire. The date may have been somewhere about 1320. Leland elsewhere mentions that he "drew his origin" from Wycliffe-on-Tees (*Collectanea*, ii. 329), so that his lineage was of the ancient family which is celebrated by Scott in *Marmion*. The Wycliffes had a natural connection with the college at Oxford which had been founded in the latter part of the previous century by their neighbors, the Balliols of Barnard Castle; and to Balliol College, then distinctively an "arts" college,[3] John Wycliffe in due time proceeded. It has been generally believed, and was in fact believed not many years after his death, that he was a fellow of Merton College in 1356; but in all probability this identification rests upon a confusion with another and contemporary John Wycliffe. That the future reformer was a fellow of Balliol College is implied in the fact that some time after 1356, but before the summer of 1360, he was elected master of the college. This office he held but a short time. So soon as 1361 he accepted a college living, that of Fillingham in Lincolnshire, and probably left Oxford for some time. In 1363, however, he was back again, this time resident in Queen's College, where he seems to have rented rooms at various dates from this year onwards;[4] on the 13th April, 1378, he obtained from his bishop leave of absence "insistendo literarum studio in universitate Oxon. per biennium," and in the following November he exchanged his benefice for one more conveniently situate, at Ludgarshall, in Buckinghamshire. A certain amount of residence at Oxford was necessary if he was now proceeding to a degree in divinity, and still more if, as is generally understood, he is the same person with the John Wycliffe who was appointed, December, 1365, to the wardenship of Canterbury Hall, a house which Archbishop Islip had lately founded for a mixed body of monks and secular clergymen, and then, changing his mind, had filled exclusively with the latter. His successor, Archbishop Langham, in 1367 reversed the arrangement, expelled Wycliffe and his colleagues, and substituted monks. Wycliffe appealed to Rome and lost his case, 1370. There seems no reason to dispute the legality of the action either of Archbishop Langham or of the cardinal who tried the appeal at Viterbo; but Wycliffe no doubt felt himself hardly used, and (if he be rightly identified with the reformer) the experience may have confirmed him in some of the opinions which are characteristic of his subsequent career, and which have been attributed, but only on the authority of a bitter opponent, Thomas Netter of Walden, to disappointment at not receiving the bishopric of Worcester (perhaps at its voidance in 1368). But the doubt as to the identification in the one case, and the suspicion attaching to the evidence in the other, may disincline us to reason about the motives which directed Wycliffe on to the path of reform.

Some years indeed before this time he had thrown himself publicly into the defence of what had become the national resistance to the papacy at Avignon, closely associated as the latter was with the interests of France. He had entered the service of the royal court, and apparently as king's chaplain ("peculiaris regis clericus") had published a tract, *Determinatio quædam de Dominio*, in support of the action of parliament in 1366, when it repudiated the tribute due to the pope. The tract is of interest, not only because it contains the first trace of the writer's special doctrine of "dominium" or *lordship* (adjusting the spiritual relation to a feudal framework), but also because it shows the line of thought by which Wycliffe's position became determined in a sense hostile to the papal system. It was not at the outset dogmatic but political elements in it which provoked his censure. He disputed the right of the spiritual power to interfere in temporal matters, and was gradually led on to deny the lawfulness of any temporal possessions of the church, and thus to become the common enemy of the beneficed clergy and of the endowed monks; with the friars he was at present on friendly terms. Wycliffe thus drew from Richard FitzRalph, archbishop of Armagh, whose instruction he may have personally followed in his youth,[5] his doctrine of "dominium,"

[1] A note is necessary as to the spelling of Wycliffe's name. Out of thirteen contemporary entries in *documents*, twelve give "y" in the first syllable; the seven entries in the Queen's College accounts show four with "y" to three with "i," but these do not certainly refer to the reformer. In not one of these is there a "ck" (though once a "ke") (see Mr. F. D. Matthew, in the *Academy*, June 7, 1884). The chroniclers, etc., offer every imaginable variety of spelling, and it is possible that our favorite form in more recent times, "Wickliffe," derived its popularity from the old play on the name, "nequam vita," which we find in Gascoigne. Our choice must be decided by usage, and the spelling adopted in the present article is that of the village from which Wycliffe derived his name; it is also preferred by the editors of the Wycliffe Bible, by Milman, and by Bishop Stubbs. Among the rest "Wyclif" has the support of Shirley, of Mr. T. Arnold, and of the Wyclif Society; while "Wiclif" is the popular form in Germany.

[2] *Itinerary*, Stow's transcript, Bodleian Library, Tanner MS., p. 464, f 45 (Leland's original being mutilated at this place). Hearne misprinted the name "Spreswel," and thus set all Wycliffe's biographers on a search after a vox nihili.

[3] See a document of 1325 printed in the appendix to the *Fourth Report* of the Historical Manuscripts Commission, p. 442 *sq.* Provision for theological study was made by the benefaction of Sir Philip Somerville in 1340 (Lyte, *Hist. of the Univ. of Oxford*, p. 154, 1886).

[4] Hence arose the common mistake, which was repeated so lately as in Milman's *Hist. of Latin Christianity*, bk. xiii. ch. vi., that Wycliffe *began* his university career at Queen's College. It is indeed open to question whether this be not yet another John Wycliffe: see Mr. H. T. Riley's remarks in the *Second Report* of the Historical Manuscripts Commission, appendix, p. 141 *sq.*

[5] Archbishop FitzRalph had been a fellow of Balliol College, and was vice-chancellor of the university in or about 1333 (A. à Wood, *Fasti Oxon.*, p. 21, ed. Gutch, 1790). His work, on which Wycliffe mainly based his theory, is entitled *De Pauperie Salva-*

which the latter had employed against the friars and in favor of the endowed clergy; while at the same time he combined it with the doctrine of the excellence of "evangelical poverty" which he derived from William of Ockham and the tradition of the Spiritual Franciscans nearly half a century earlier. Wycliffe's position may appear paradoxical; but in truth he made a selection from the discordant views, and built up a consistent theory of his own, of which the salient principles were (1) that sin deprived a man of all right to possess anything; (2) that all property should be held in common; (3) that the spiritual power is entirely separate from the civil, and thus (4) that, should it overstep its bounds and come into contact with temporal concerns, it becomes thereby subject to civil jurisdiction; (5) that the church should hold no property; (6) that excommunication is of no effect unless justified by the sin of him against whom it is directed; and (7) that in no case should it be pronounced for any offence connected with temporal affairs. These views are expounded in Wycliffe's several treatises *De Dominio*, which were written some time before 1377 and probably not long after 1370, though their precise date has not yet been established.[1]

Plainly such a writer was likely to be useful to the court, where John of Gaunt was now supreme,—especially since Wycliffe enjoyed the reputation of an unmatched proficiency in the scholastic learning of his day. On the 7th April, 1374, he was presented by the crown to the rectory of Lutterworth, in Leicestershire, which he held until his death; and on the following July 26th he was nominated one of the royal ambassadors to proceed to Bruges to confer with the papal representatives on the long-vexed question of "provisions." The rank he took is shown by the facts that his name stands second, next after that of the bishop of Bangor, on the commission, and that he received pay at the princely rate of twenty shillings [$15.62] per diem. The commission itself was appointed in consequence of urgent and repeated complaints on the part of the Commons, but the negotiations were practically fruitless; the king had an interest in keeping up the system of papal provisions and reservations, and it could hardly be expected that any concessions that might be gained by his commissioners would imply more than a temporary compromise or an illusory advantage. Yet it is possible that the real result of the negotiations is to be found, not in the formal stipulations, but in certain articles not then committed to writing which were laid before the English parliament in February, 1377.

Some time after his return Wycliffe was given the prebend of Aust in the collegiate church of Westbury-on-Trim, which he held but a short time, the confirmation of his appointment (November 6, 1375) being followed within a fortnight by the grant of the benefice to another person. Henceforth he lived mainly at Lutterworth and Oxford, making, however, frequent and, as it seems, prolonged visits to London from time to time. He assumed the position of a popular preacher there, and delighted an audience already sufficiently disaffected towards the rich and powerful clergy. He was also closely allied with John of Gaunt, who welcomed him as an instrument towards his design of humbling the church. Wycliffe indeed expressly refused to affirm that it was in such a condition as to deserve spoliation; but when to this he added that the decision was the affair of statesmen, "politicorum qui intendunt praxi et statui regnorum" (*De Civili Dominio*, i. 37, p. 269), it is plain that his theory might readily commend itself to the duke, while the proviso could only increase the hostility towards him of the endowed clergy. For some years he was suffered to spread his doctrines without hindrance. The archbishop of Canterbury, Simon Sudbury, had no mind to proceed against him until at length the pressure of the bishops compelled him to summon the dangerous preacher to appear before the bishop of London and answer certain charges laid against him. The nature of these accusations is not stated, but their purport can hardly be doubtful. On the 19th February, 1377, Wycliffe made his appearance at St. Paul's. He was accompanied by the duke of Lancaster, by Lord Percy, the marshal of England, and by four doctors of the four mendicant orders. The trial, however, came to nothing; for, before Wycliffe could open his mouth, the court was broken up by a rude brawl between his protectors and Bishop Courtenay, ending in a general riot of the citizens of London, who were so much enraged by the insult to their bishop in his own cathedral church—coming as this did at the same time as a serious attempt at an invasion by the duke in parliament of their civic liberties (*Chron. Angl.*, p. 120)—that they would have sacked his palace of the Savoy had not Courtenay himself intervened.

Wycliffe had escaped for the time, but his enemies did not rely solely on their own weapons. Probably before this they had set their case before the pope; and towards the end of May five bulls were issued by Gregory XI., who had just returned to Rome from Avignon, condemning eighteen (or in other copies nineteen) "conclusions" drawn from Wycliffe's writings. All the articles but one are taken from his first book *De Civili Dominio*, the recent publication of which shows the charges to be honestly made and the quotations to be entirely free from any suspicion of unfairness. The bulls truly stated Wycliffe's intellectual lineage; he was following in the error of Marsiglio of Padua; and the articles laid against him are concerned entirely with questions agitated between church and state—how far ecclesiastical censures could lawfully affect a man's civil position, and whether the church had a right to receive and hold temporal endowments. The bulls were addressed (May 22) to the archbishop of Canterbury and the bishop of London, the university of Oxford, and the king. The university was to take Wycliffe and send him to the prelates; the latter were then to examine the truth of the charges and to report to the pope, Wycliffe being meanwhile kept in confinement. The execution of the papal bulls was impeded by three separate causes,—the king's death on the 21st June; the tardy action of the bishops, who enjoined the university to make a report, instead of simply sending Wycliffe to them; and the unwillingness of the university to admit external authority, and, above all, the pope's right to order the imprisonment of any man in England. The convocation, indeed, as the St. Albans chronicler[2] states with lamentation, made serious objections to receiving the bull at all; and in the end it merely directed Wycliffe to keep within his lodgings at Black Hall for a time.

If the university was disposed to favor the reformer, the Government was not less so. John of Gaunt was for the moment in retirement; but the mother of the young king appears to have adopted his policy in church affairs, and she naturally occupied a chief position in the new council. As soon as parliament met, in the autumn of 1377, Wycliffe was consulted by it as to the lawfulness of prohibiting that

toris, and exists only in manuscript; but Mr. R. L. Poole is preparing the greater part of it for publication. An old legend makes Wycliffe take part in the archbishop's controversy with the friars so early as 1360. It was suspected by Robert Vaughan, and then denied by Shirley. The further researches of Dr. Lechler have placed the late date at which Wycliffe began his opposition to the friars on a sure foundation: and the fact has been confirmed decisively by the publication of the St. Albans *Chronicon Angliæ*, by Mr. E. M. Thompson, in 1874 (see pp. 116, 118), and more recently by that of the reformer's earlier Latin works.

[1] It is uniformly asserted that Wycliffe fell into heresy after his admission to the degree of doctor (*Fasc. Ziz.*, p. 2). The process about Canterbury Hall makes the warden B.D. in 1367 or 1368 (Lytc, p. 252, n. 5),—so that if he be the reformer we have an approximate *terminus a quo* for his inception.

[2] When he says that the bull was only received at Oxford shortly before Christmas, he is apparently confounding it with the prelates' mandate, which is dated December 18 (Lewis, appendix xvii.)—*Chron. Angl.*, p. 173.

treasure should pass out of the country in obedience to the pope's demand. Wycliffe's affirmative judgment is contained in a state paper still extant; and its tone is plain proof enough of his confidence that his views on the main question of church and state had the support of the nation.[1] Indeed he had laid before this same parliament his answer to the pope's bulls, with a defence of the soundness of his opinions. His university, moreover, confirmed his argument; his tenets, it said, were true (*i.e.*, orthodox), though their expression was such as to admit of an incorrect interpretation. But Wycliffe was still bound to clear himself before the prelates who had summoned him, and early in 1378 he appeared for this purpose in the chapel of Lambeth Palace. His written defence, expressed in some respects in more cautious language than he had previously used, was laid before the council; but its session was rudely interrupted, not only by an inroad of the London citizens with a crowd of the rabble, but also by a messenger from the princess of Wales enjoining them not to pass judgment against Wycliffe; and thus a second time he escaped, either without sentence, or at most with a gentle *request* that he would avoid discussing the matters in question. Meanwhile his "protestatio" was sent on to Rome.

In the autumn of this year Wycliffe was once more called upon to prove his loyalty to John of Gaunt. The duke had violated the sanctuary of Westminster by sending a band of armed men to seize two knights who had taken refuge there. They resisted, and one of them was killed. After a while the bishop of London excommunicated all concerned in the crime (excepting only the king, his mother, and his uncle), and preached against the culprits publicly at St. Paul's Cross. The duke, fearing the anger of the Londoners, arranged that the ensuing parliament should be held at a safe distance, at Gloucester, and, it was rumored, proposed to bring before it a sweeping scheme of spoliation of church property. Wycliffe was required to write an apology for the duke's actions at Westminster. His paper, which is still preserved, and forms part of the *De Ecclesia*, seeks, without excusing the homicide, to lay down the limits within which the privilege of asylum is permissible, and maintains that the duke was right in invading the sanctuary in order to bring escaped prisoners to justice. But the duke's whole behavior seems to have been high-handed, and Wycliffe can with difficulty be excused from a charge of subserviency to his patron.

The year 1378 forms a turning point in Wycliffe's career. The schism in the papacy caused by the election in September of Clement VII. in opposition to Urban VI. slowly decided Wycliffe towards a more revolutionary attitude with respect to the Roman see, a power which he now convinced himself was at the root of the disorders of the church. He set on foot an active propaganda, choosing the two special means of sending forth his "poor" or "simple priests" to preach pure doctrine throughout the country, and of making the first complete English version of the Bible. This latter work was mainly executed by Wycliffe himself, but his friend Nicholas Hereford did part of the Old Testament. Afterwards the whole was revised by John Purvey, who assisted Wycliffe in his parish duty at Lutterworth, and finished his edition probably not long after the reformer's death. Most existing copies are of the latter redaction, which is printed in parallel columns with the older one in the great edition of the version edited by J. Forshall and Sir F. Madden (Oxford, 1851). Wycliffe's translation of the Bible, and still more his numerous English sermons and tracts, establish his now undisputed position as the founder of English prose writing.

Wycliffe's itinerant preachers were not necessarily intended to work as rivals to the beneficed clergy. The idea that underlay their mission was rather analogous to that which animated Wesley four centuries later. Wycliffe aimed at supplementing the services of the church by regular religious instruction in the vernacular; and his organization included a good number of men who held or had held respectable positions in their colleges at Oxford. The influence of their teaching was soon felt throughout the country. The common people were rejoiced by the plain and homely doctrine which dwelt chiefly on the simple "law" of the gospel, while they no doubt relished the denunciation of existing evils in the church which formed, as it were, the burthen of such discourses. The feeling of disaffection against the rich and careless clergy, monks, and friars was widespread but undefined. Wycliffe turned it into a definite channel (he was now persuaded that the friars were as bad as the monks); he insensibly passed from an assailant of the papal to an assailant of the sacerdotal power; and in this way he was led to reject the distinctive symbol of that power, the doctrine of transubstantiation. It was in the summer of 1381[2] that Wycliffe propounded at Oxford a set of theses, substituting for the accredited doctrine of the church one which allowed the real presence of Christ in the consecrated elements, but denied any change of substance, a doctrine practically undistinguishable (unless by its scholastic form) from the modern Lutheran doctrine. The theologians of the university were at once roused. The chancellor, William Berton, sat with twelve doctors (half of whom were friars), and solemnly condemned the theses; Wycliffe appealed to the king, and John of Gaunt hastily sent down a messenger enjoining the reformer to keep silence on the subject.

The condemnation at Oxford was almost immediately followed by the Peasants' Revolt, with which it has been supposed that Wycliffe had something to do. The only positive fact implicating him is the confession of one of its leaders, John Ball, that he learned his subversive doctrines from Wycliffe. But the confession of a condemned man can seldom be accepted without reserve; and we have not only the precise and repeated testimony of Knyghton that he was a "precursor" of Wycliffe, but also documentary evidence that he was excommunicated as early as 1366, long before Wycliffe exposed himself to ecclesiastical censure. Wycliffe in truth was always careful to state his communistic views in a theoretical way; they are confined to his Latin scholastic writings, and thus could not reach the people from him directly. At the same time it is very possible that his less scrupulous followers translated them in their popular discourses, and thus fed the flame that burst forth in the rebellion. Perhaps it was a consciousness of a share of responsibility for it that led them to cast the blame on the friars. In any case Wycliffe's advocates must regret that in all his known works there is only one trace of any reprobation of the excesses that accompanied the outbreak.

In the following spring his old enemy William Courtenay, now archbishop of Canterbury, resolved to take measures for stamping out Wycliffe's crowning heresy. He called a provincial council at the Blackfriars in London, which assembled on the 21st May, 1382, and sat with intervals until July. The council was met by a hardly expected manifestation of university feeling on Wycliffe's side. The chancellor and both the proctors stood by him. They allowed a Wycliffite sermon to be preached before the university on Ascension Day. The archbishop's commissary complained that his life

[1] In one text of this document a note is appended, to the effect that the council enjoined silence on the writer as touching the matter therein contained (*Fasciculi Zizaniorum*, p. 271). This, if true, was apparently a measure of precaution.

[2] This is the date given in the *Fasciculi Zizaniorum*. Wood, however, makes Berton chancellor in 1380 and 1382. But if Wycliffe's heresy was first put forth in the latter year there seems to be hardly time for the condemnation and then for the archbishop's summons to the London council in May. It is safest therefore to leave the date of the *Fasciculi Zizaniorum* undisturbed. The Peasants' Revolt in June, 1381, and the murder of Archbishop Sudbury, may sufficiently account for the interval between the Oxford and the London proceedings.

was not safe at Oxford. Still no steps were taken to bring Wycliffe to judgment. Twenty-four articles extracted from his works were condemned; some of his prominent adherents were imprisoned until they recanted; the university officers were soon brought to submission, but Wycliffe himself remained at large and unmolested. It is said indeed by Knyghton that at a council held by Courtenay at Oxford in the following November Wycliffe was brought forward and made a recantation; but our authority fortunately gives the text of the recantation, which proves to be nothing more nor less than a plain English statement of the condemned doctrine. It is therefore lawful to doubt whether Wycliffe appeared before the council at all, and even whether he was ever summoned before it. Probably after the overthrow of his party at Oxford by the action of the Blackfriars council Wycliffe found it advisable to withdraw permanently to Lutterworth. That his strength among the laity was undiminished is shown by the fact that an ordinance passed by the House of Lords alone, in May, 1382, against the itinerant preachers was annulled on the petition of the Commons in the following autumn. In London, Leicester, and elsewhere there is abundant evidence of his popularity. The reformer, however, was growing old. There was work, he probably felt, for him to do, more lasting than personal controversy. So in his retirement he occupied himself, with restless activity, in writing numerous tracts, Latin and English, as well as one of his most important books, the *Trialogus*. In spite of a paralytic seizure which came upon him in 1382 or early in 1383, he continued his labors. In 1384 it is stated that he was cited by pope Urban VI. to appear before him at Rome; but to Rome he never went. On the 28th of December of this year, while he was hearing mass in his own church, he received a final stroke, from the effects of which he died on the New Year's eve.[1] He was buried at Lutterworth; but by a decree of the council of Constance, May 4, 1415, his remains were ordered to be dug up and burned, an order which was carried out by Bishop Fleming in 1428.

At this distance of time Wycliffe's reputation is still a battle-ground of parties. By those who uphold the indefeasible sanctity of church property, the exemption of the church from all control or oversight on the part of the state, or yet more the apostolic prerogative of the Roman see, his political doctrine is judged as revolutionary, sacrilegious, and heretical. His denial of transubstantiation is conceived to imply a base hypocrisy in his continued discharge of priestly functions; but they who maintain this argument should bear in mind that the office of the mass is older than the doctrine of transubstantiation, and a man cannot be fairly accused of dishonesty in using words in a sense at all events nearer that in which they were originally written. A sober study of Wycliffe's life and works justifies a conviction of his complete sincerity and earnest striving after what he believed to be right. If he cannot be credited (as he has been by most of his biographers) with all the Protestant virtues, he may at least claim to have discovered the secret of the immediate dependence of the individual Christian upon God, a relation which needs no mediation of any priest, and to which the very sacraments of the church, however desirable, are not essentially necessary. When he divorces the idea of the church from any connection with its official or formal constitution, and conceives it as consisting exclusively of the righteous, he may seem to have gone the whole length of the most radical reformers of the 16th century. And yet, powerful as was his influence in England, it was but transient, and within forty years it was nearly extinct. His true tradition is to be found not in his own country but in Bohemia, where his works were eagerly read and multiplied, and where his disciple John Huss, with less originality but greater simplicity of character and greater spiritual force raised Wycliffism to the dignity of national religion. To Huss, whose works are to a great extent a cento of extracts from Wycliffe, Luther owed much; and thus the spirit of the English teacher had its influence on the reformed churches of Europe.

The documentary materials for Wycliffe's biography are to be found in John Lewis's *Life and Sufferings of J. Wiclif* (new ed., Oxford, 1820), which contains a valuable appendix of illustrative papers and records; Foxe's *Acts and Monuments*, vol. iii., ed. 1855, with app.; Forshall and Madden's preface to the Wycliffe Bible, p. vii. note, Oxford, 1851; W. W. Shirley's edition of the *Fasciculi Zizaniorum* (probably the work of Thomas Netter of Walden), 1858; and H. T. Riley's notices in the appendices to the *Second* and *Fourth Reports* of the Historical Manuscripts Commission. Among contemporary records the recently discovered narrative of a monk of St. Albans—a bitter opponent of John of Gaunt—is of conspicuous value; it was published under the title of *Chronicon Angliæ*, by Mr. E. M. Thompson, 1874. Of this the account in Walsingham's *Historia Anglicana* (ed. H. T. Riley, 1863, 1864) is mainly a modified version. Knyghton, who wrote *De Eventibus Angliæ* at Leicester in the heart of what may be called the Wycliffe country, is very well informed as to certain passages in the reformer's history, though his chronology is extremely faulty (printed in Twysden's *Hist. Anglic. Scriptores Decem*, 1652). There are valuable notices also in the continuation of the *Eulogium Historiarum* (vol. iii., ed. F. S. Haydon, 1863), in the *Chronicle* of Adam of Usk (ed. E. M. Thompson, 1876), and in more than one of the continuations of Higden. For the study of Wycliffe's theology the controversial works of Wodeford and Walden are important, but must necessarily be used with caution.

Of modern biographies that by Dr. G. V. Lechler (*Johann von Wiclif und die Vorgeschichte der Reformation*, 2 vols., Leipsic, 1873; partial Engl. trans., by P. Lorimer, 1878, 1881, and 1884) is by far the most comprehensive; it includes a detailed exposition of the reformer's system, based to a considerable extent on works which were then unpublished. Shirley's masterly introduction to the *Fasciculi Zizaniorum*, and Mr. F. D. Matthew's to his edition of *English Works of Wyclif hitherto unprinted* (1880), as well as Mr. Creighton's *History of the Papacy during the Period of the Reformation*, vol. i., 1882, and Mr. H. C. Maxwell Lyte's account in his *History of the University of Oxford* (1886), add to or correct our stock of biographical materials, and contain much valuable criticism. Wycliffe's political doctrine is discussed by Mr. R. L. Poole (*Illustrations of the History of Mediæval Thought*, 1884); and his relation to Huss is elaborately demonstrated by Dr. J. Loserth (*Hus und Wiclif*, Prague, 1884; also Engl. trans.).

Wycliffe's works are enumerated in a *Catalogue* by Shirley (Oxford, 1865). The following are published: *A. Latin.—De Officio Pastorali*, ed. G. V. Lechler, Leipsic, 1863; *Trialogus*, ed. G. V. Lechler, Oxford, 1869; portions of the *Summa in Theologia*, viz., *De Civili Dominio*, i., ed. R. L. Poole, 1885, and *De Ecclesia*, ed. J. Loserth, 1886; *De Benedicta Incarnatione*, ed. E. Harris, 1886; *Dialogus sive Speculum Ecclesiæ Militantis*, ed. A. W. Pollard, 1886; *Sermones*, ed. J. Loserth, 2 vols., 1887–88; *Polemical Tracts*, ed. R. Buddensieg, 2 vols., 1883; *De Compositione Hominis*, an early work, ed. R. Beer, 1884. All but the first two of these are issued by the Wyclif Society, which was founded in 1882 for the purpose of publishing all the reformer's unedited works.

B. English.—Select English Works, ed. T. Arnold, 3 vols., 1869–71, and *English Works hitherto unprinted*, ed. F. D. Matthew, 1880, chiefly sermons and short tracts, of many of which the authenticity is uncertain. *The Wicket* (Nuremberg, 1546; reprinted Oxford, 1828) is not included in either of these collections.

(R. L. P.)

WYCOMBE, High Wycombe, or Chipping Wycombe, a municipal borough and market-town of Bucks, is situated in the valley of the Wyck and on a branch of the Great Western Railway, 29 miles west-north-west of London, 25 southeast of Oxford, and 10 north of Maidenhead. Notwithstanding many additions to the town within recent years, it still retains many evidences of antiquity, including several mediæval buildings. The parish church of All Saints, the largest in the county, was rebuilt in 1273 by the abbess and nuns of Godstowe, Oxfordshire, on the site of an earlier Norman structure, and underwent extensive reconstruction in the beginning of the 15th century. The present western tower, 108 feet in height, was completed in 1522, and adorned with pinnacles in 1753. The style of the building is now Early English with Decorated and Perpendicular additions. The interior underwent extensive restoration in 1874, under the direction of the late G. E. Street, and the restoration of the exterior is at present (1888) in progress. For the grammar school, founded in 1555 by the mayor and burgesses of Wycombe, and now under the direction of the charity commissioners, a handsome new building was erected in 1883. The remains of the Norman hall of St. John the Baptist, incorporated in the old school building, with its chapel in the Early English style, adjoins the new building. The other principal public buildings are the guild-hall, originally erected by the earl of Shelburne in 1757, and altered and improved in 1859; the literary institute, 1854; the free library, permanently endowed by a subscription of the townspeople after the premises had been presented by J. O. Griffiths; the High Wycombe hospital, established in 1875; the shambles, erected in 1761 on the site of the old hog market; and the South Bucks auction mart, 1887.

[1] Of Wycliffe's personal appearance we know hardly more than that he was a spare man with frail health. None of the existing portraits of him is contemporary.

Some remains still exist of Desborough Castle, supposed to have been erected for defence against the Danes. There are a number of almshouses, including those of Queen Elizabeth, endowed in 1562 out of the revenues of the dissolved fraternity of St. Mary. In 1797 a military college was established at Wycombe, which was transferred to Farnham and the junior department to Sandhurst in 1812 and 1813. The Frogmore gardens were presented to the town by J. O. Griffiths in 1877 as public pleasure grounds. There is a common pasturage, 30 acres in extent, called the Rye. Formerly lace and strawplait making were the staple industries, but they have been superseded by chair-making, which of late years has greatly increased, the number of chairs made annually now amounting to over 1½ millions. The rise of the industry was due to the beech-woods in the neighborhood; but, in addition to the cane and rush-bottomed chairs, for which these woods supply the frames, chairs of a finer kind are now also made from walnut, cherry, and other more valuable woods. There are also flour and paper mills. The borough, which is divided into three wards, is governed by a mayor, six aldermen, and eighteen councillors. The population of the municipal borough in 1871 (area then 122 acres) was 4811; in 1880 the area was extended to 400 acres, and the population in 1881 was 10,618. The population of the parliamentary borough (area 6395 acres), which existed till 1885, was 10,492 in 1871 and 13,154 in 1881.

From the character of Roman remains found at Wycombe it seems to have been an important Roman station. By the Saxons a fortress called Desborough castle was erected for its defence. At the Conquest it was a borough town, and was then held by Robert Doily or Doyley. In the 9th year of Edward I. it reverted to the crown. The incorporation of the borough is ascribed to Henry I. From the 28th of Edward I. it returned two members to parliament, but in 1867 the number was reduced to one, and in 1885 it was merged in the South or Wycombe Division of the county. Camden, writing in the beginning of the 17th century, says of it, "This town for largeness and beauty compares with the best in the county, and as it is governed by a mayor is justly preferrred to the rest." During the Civil War it was the scene of a skirmish between Prince Rupert and the Parliamentarian forces, in which the latter were defeated.

See Parker's *Antiquities of Wycombe*, 1878.

WYNTOUN, Andrew of, a Scottish monk who flourished at the beginning of the 15th century, was the author of the *Orygynale Cronykil of Scotland*. The chronicle, which is in verse and has some historical value from the use made in it of the St. Andrews registers, is called "original" because it begins with the beginning of the world, the second chapter giving an account of the creation of man. The history of Scotland is brought down to the death of Robert III. in 1406. Of the chronicler himself nothing is known except what he tells us in his prologue, namely, that he was a canon regular of St. Andrews, and prior of Serf's Inch in Lochleven. The chronicle has been twice carefully edited and annotated,—by Macpherson in 1795, and by David Laing in 1872–79.

WYOMING, a Territory[1] of the United States, is nearly rectangular in shape, having as its boundaries the 41st and 45th parallels of N. latitude and the 27th and 34th meridians west of Washington. South of it are Colorado and Utah; on the west, Utah, Idaho, and Montana; on the north, Montana; and on the east, Dakota and Nebraska. The area is 97,890 square miles. Plate XVII.

The surface is greatly diversified. Its mean elevation is great, being probably not less than 6400 feet. The lowest portions of the Territory are along the northern and eastern borders, where in several places the surface is less than 500 feet above sea-level, while its highest points exceed 13,000 feet. By far the greater part consists of high plains, which are broken by numerous mountain ranges and ridges, which form parts of the Rocky Mountain system. This system enters the Territory in the southeastern part, and traverses it in a northwest direction. On the south it consists of three members, the Laramie range, which is crossed by the Union Pacific Railroad at Sherman, and the Medicine Bow and Park ranges, which separate branches of the North Platte river. These ranges run out and fall down into the plain in the southern part of the Territory, leaving for 150 miles a broad flat plateau to represent the Rocky Mountain system. The ill-defined summit of this plateau forms the parting between the waters of the Missouri and Colorado. Eastward this plateau slopes to the Great Plains, and westward to the Green river basin. The Union Pacific Railroad traverses it, and therefore the traveller upon this road sees little of the Rocky Mountains except at a distance. Farther north the mountains rise again from this plateau in several ranges. The principal of these is that known as the Wind River range, which in a sense is continued northward beyond the northern boundary of the Territory by the Absaroka range. The former contains the most elevated land in the Territory, its highest peak being Fremont's, with an elevation of 13,790 feet.[1] The latter range is in its southern part a great volcanic plateau, elevated 10,000 to 11,000 feet above the sea, while farther north it is eroded into very rugged mountain forms. About the point where these ranges join, there is a confused mass of mountains of great breadth and considerable height. In this elevated mass rise streams flowing to the Atlantic, the Gulf of California, and the Pacific. The highest peaks of these mountains are those known as the Three Têtons, the most elevated of which, Mount Hayden, has an altitude of 13,691 feet.[2] East of the Wind River and Absaroka ranges, and separated from them by the valley of the Wind River and the Big Horn basin, is the range known as the Big Horn Mountains, which is reputed to contain peaks having an altitude of 12,000 feet. These ranges form the backbone of the Territory. Eastward from the Big Horn and Laramie ranges stretch the plains in an almost unbroken expanse, gently sloping to the eastward from an altitude of about 6000 feet at the base of the mountains, while southwest of the Wind River range is spread the expanse of the Green river basin, through which flows the principal fork of the Colorado. Mountains.

The drainage system of Wyoming is somewhat complex. While the mountainous regions are well watered by numerous streams, the broad valleys and the plains are poorly supplied with streams. Many of those which flow full in the mountains during the entire year run dry in summer upon the plains. None of the streams are navigable. The eastern three-fourths of the Territory is drained by the tributaries of the Missouri to the Atlantic. Of this area the North Platte drains the southern portion of the Rocky Mountain system, together with a large part of the plains lying north and east of it. Farther northward and eastward the plains are drained by the Cheyenne river. The eastern face of the Big Horn mountains is drained by the Powder and Tongue rivers, while from its western slopes, and from the eastern slopes of the Wind River and Absaroka ranges, the Wind River, known lower down in its course as the Big Horn, collects the waters. The Yellowstone, heading in the confused mass of mountains about the north end of the Wind River range, flows northward through a beautiful lake, draining the west slope of the Absaroka range. The Snake or "Mad" river of the early explorers, heading in the same mass of mountains, flows southwestwards to seek an exit from them, while the Green, whose sources are in the same elevated country, drains the west slope of the Wind River range, and flows southward through the broad sage-covered expanse known as the Green river basin. In the southwest corner of the Rivers.

[2] [In the Governor's *Annual Report* for 1883 Fremont Peak is given as 13,570 and Hayden as 13,858 feet in height.—Am. Ed.]

Territory is a small area drained by means of Bear river into Great Salt Lake.

Geology. The geological structure of Wyoming is even more complicated than its surface features. In the northwestern corner is an area in which volcanic action, as represented in hot springs and geysers, is still alive, while the evidences of volcanic action upon a tremendous scale, in recent geological time, are seen in the form of sheets of lava and volcanic breccia, which are spread over the land, and from which mountain ranges have been carved. Most of this region is comprised in the YELLOWSTONE NATIONAL PARK (*q.v.*), which has been set apart from settlement by the general Government. Many of the mountain slopes show a succession of the stratified formations, from the Triassic downwards through the series. The plains region is mainly floored by Tertiary and Cretaceous formations, as is also the case with the higher plateaus and with the Green river basin.

Fauna. The native fauna of Wyoming resembles that of the other northwest Territories. The larger quadrupeds which were formerly very abundant, and which are now not unfrequently to be met with, are the grizzly, black, and cinnamon bears, the North American panther, the elk, the moose, two or three species of deer, and the antelope. Upon the plains are seen the gray wolf and the coyote, the jack rabbit, the prairie dog, and the gopher. The buffalo, which was formerly extremely abundant upon the plains, is now practically extinct.

Flora. The eastern plains are mainly grass-covered, but as one goes westward the grass gradually disappears, and gives place to artemisia and greasewood. Forests are confined almost entirely to the mountains, although the high plains in the Yellowstone Park, in the northwestern corner of the Territory, are covered with timber. The forests are composed of quaking aspen upon the lower slopes, succeeded at greater elevations by pines and spruces, the upper limit of timber in the Territory being about 10,000 feet above the sea.

Climate. Wyoming has, in common with most of the western States, an arid climate. In the arable regions the rainfall is nowhere sufficient for the needs of agriculture, and irrigation is universally practiced. The rainfall ranges in this part of the Territory from 8 to 15 inches, being greater in the eastern part and diminishing westward. Upon the mountains it probably reaches, if it does not exceed, 30 inches annually.

The temperature ranges with the elevation. Upon the plains and plateaus and in the valleys (this comprising nearly all the habitable parts of Wyoming) the annual temperature is between 40° and 50° F. Upon the mountains it diminishes until at an altitude of 10,000 feet it reaches approximately the freezing point.

Population. At the last census (1880) the Territory contained 20,789 inhabitants.[1] In 1870 there were only 9118, showing an increase of 128 per cent. The population is now (1888) estimated at not far from 40,000. As in all frontier communities, a large proportion consists of adult males. In 1880 there were 14,152 males to 6637 females. The proportion of the foreign born was large there being 5850 of this class to 14,939 natives.

The Territory contains eight counties: Albany (population 4626), Carbon (3438), Crook (239), Johnson (637), Laramie (6409), Sweetwater (2561), Uinta (2879), and Fremont (formed since 1880). The principal cities are Cheyenne, the capital, which is situated upon the plains, near the east base of the Laramie range (population in 1880, 3456); Laramie City, near the west base of the same range (2696); Rawlins, upon the high plateau forming the continental watershed (1451); and Evanston in the southwest corner of the Territory (1277).

Cattle raising. The industries of Wyoming mainly relate to the raising of cattle and to mining. The former industry is in proportion to the number of inhabitants very large, and has been until recently extremely profitable. The raising of cattle is carried on at slight expense, the cattle being allowed to range freely over the plains, and little provision is made for feeding and shelter, even in winter, as the loss from exposure and starvation is not sufficiently great to warrant the additional expense. In 1880 the number of cattle was returned as 521,213 and sheep as 450,225. In 1887 the report of the governor states that the number of cattle has increased to 753,648, while that of sheep has slightly diminished, being 421,688.

Mining. Mines of gold and silver have been worked to a limited extent near the east base of the Wind River range and in the northwestern part of the Territory and also at the extreme south, in the Park range, but the production is insignificant. On the other hand, the coal mines of Wyoming are very valuable; they are mainly situated in the southern part of the Territory, at Carbon, Rock Spring, Almy, and Twin Creek, on or near the Union Pacific Railroad. The production in 1886 was 829,355 tons, valued at $2,488,065.

Government. As in other Territories, the Government of Wyoming is under the immediate jurisdiction of the United States, the executive and judicial officers being appointed by the president. The treasurer is appointed by the governor. The Territory has a legislature consisting of two houses, the members of which are elected by the people.

History. The area of Wyoming was in the main included in the Territory of Louisiana, acquired by the United States by purchase from France. The western part was acquired by prior settlement, as was the case with Washington, Oregon and Idaho. It was organized as a Territory in 1868. The progress of settlement has until recent years been very slow, owing to the inhospitable character of the country along its southern border, traversed by the Union Pacific Railroad, and to the occupation by Indians of the more fertile districts. Latterly, as the Indians have been removed, settlement has progressed more rapidly. (H. G.*)

WYON, THOMAS (1792–1817), medallist, was born at Birmingham in 1792. He was apprenticed to his father, the chief engraver of His Majesty's seals, and studied in the schools of the Royal Academy, London, where he gained silver medals in both the antique and the life class; he also obtained a gold medal from the Society of Arts. He was appointed probationary engraver to the mint in 1811, and soon after engraved his medal commemorative of the peace, and his Manchester Pitt medal. In 1815 he was appointed chief engraver to the mint; but he sank into ill-health and died at Hastings on September 22, 1817, at the age of twenty-five.

A memoir of Wyon, with a list of his works, appeared in the *Gentleman's Magazine* for February, 1818. His younger brother, Benjamin Wyon (1802–1858), and his nephews, Joseph Shepherd Wyon (1836–1873) and Alfred Benjamin Wyon (1837–1884), were also well-known medallists. They successively held the appointment of chief engraver of Her Majesty's seals.

WYON, WILLIAM (1795–1851), medallist, cousin of Thomas Wyon, was born at Birmingham in 1795. In 1809 he was apprenticed to his father, a die-sinker. Removing to London, he studied the works of Flaxman, attended the schools of the Royal Academy, and gained a gold medal from the Society of Arts for a copy of the head of Ceres, and a second for an original group. In 1816 he was appointed assistant engraver to the mint, and in 1828 chief engraver; in 1831 he was elected associate and in 1838 full member of the Royal Academy. He executed coinages for George IV., William IV., and Queen Victoria, the Peninsular, Trafalgar, and Cabul medals, the William IV. coronation medal, and those of many learned societies. He died at Brighton on October 29, 1851. A memoir with a list of his works, by Nicholas Carlisle, was privately issued in 1837.

WYTTENBACH, DANIEL ALBERT (1746–1820), a famous classical scholar, was born at Bern, of a family whose nobility and distinction he loved to recall. In particular, he was proud of his descent from Thomas Wyttenbach, professor of theology in Basel at the end of the 15th and beginning of the 16th centuries, who numbered the Reformer Zwingli and other distinguished men among his pupils. Wyttenbach's own father was also a theological professor of considerable note, first at Bern, and then at Marburg. His removal to Marburg, which took place in 1756, was partly due to

[1] [The territorial Secretary of State estimated the population at 65,000 in 1885, an increase especially felt in Cheyenne and Laramie City. Copper, graphite, sulphur and petroleum are among the mineral resources of the Territory, and its railway mileage in 1887 was 721.—AM. ED.]

old associations, for the elder Wyttenbach had studied there under the famous Christian Wolff, and embodied the philosophical principles of his master in his own theological teaching. Soon after the Wyttenbachs settled in Germany the great war broke out, and the region round Marburg suffered severely, so that the scenes and excitement of military life must have powerfully affected the growth of the boy's somewhat sensitive character. After a careful preliminary education, partly in the schools of Bern and Marburg, partly by private tutors, and always under the eye of a severe but conscientious and affectionate father, young Wyttenbach entered at the age of fourteen the university of Marburg, and passed through a four years' course there. His parents intended that he should become a Lutheran pastor. The first two years were given up to general education, principally to mathematics, "philology," and history. The professor of mathematics, Spangenberg, acquired great influence over young Wyttenbach. He is said to have taught his subject with great clearness, and with equal seriousness and piety, often referring to God as the supreme mathematician, who had constructed all things by number, measure, and weight. "Philology" in the German universities of that age meant Hebrew and Greek. These two languages were generally handled by the same professor, and were taught almost solely to theological students. Wyttenbach's university course at Marburg was troubled about the middle of the time by mental unrest, due to the fascination exercised over him by Bunyan's *Pilgrim's Progress*. Like Bunyan himself, he believed that he was doomed to perdition, and that he had committed the inexpiable sin against the Holy Ghost. The disorder was cured by Spangenberg. The principal study of the third year was metaphysics, which took Wyttenbach entirely captive. The fourth and last year was to be devoted to theology and Christian dogma. Wyttenbach had hitherto submitted passively to his father's wishes concerning his career, in the hope that some unexpected occurrence might set him free. But he now turned away from theological lectures, and privately devoted his time to the task of deepening and extending his knowledge of Greek literature. His father was wise enough to leave him to follow his own bent. To use Wyttenbach's own words, he looked up to every Greek book as a temple of wisdom. But the struggle for knowledge was hard, and taxed all his powers. He possessed at the time, as he tells us, no more acquaintance with Greek than his own pupils at a later time could acquire from him during four months' study. He was almost entirely without equipment beyond the bare texts of the authors. Each author only yielded after a protracted siege. But Wyttenbach was undaunted, and four years' persistent study gave him a knowledge of Greek such as few Germans of that time possessed. His love for philosophy carried him towards the Greek philosophers, especially Plato. He describes himself as walking about the meadows near Marburg, conning portions of his text of Plato, which he had taken to pieces for easier carriage. During this period Ruhnken's notes on the Platonic lexicon of *Timæus* fell into his hands. Ruhnken was for him almost a superhuman being, whom he worshipped day and night, and with whom he imagined himself as holding converse in the spirit. Taking up the works of Julian, he emended them on the principles of Ruhnken. When Wyttenbach was twenty-two he determined to seek elsewhere the aids to study which Marburg could not afford. His father, fully realizing the strength of his son's pure passion for scholarship, permitted and even advised him to seek Heyne at Göttingen. From this teacher he received the utmost kindness and encouragement, and he was urged by him to dedicate to Ruhnken the first fruits of his scholarship. Wyttenbach therefore set to work on some notes to Julian, Eunapius, and Aristænetus, and Heyne wrote to Ruhnken to bespeak his favorable consideration for the work. Before it reached him Ruhnken wrote a kind letter to Wyttenbach, which the recipient "read, re-read, and kissed," and another on receipt of the tract, in which the great scholar declared that he had not looked to find in Germany such knowledge of Greek, such power of criticism, and such mature judgment, especially in one so young. Wyttenbach was now able with boldness to devote himself to the career of a scholar. He studied with ardor the works of the great scholars of the Netherlands, and in his morning and evening petitions prayed that it might be given him to see Valckenaer and Ruhnken in the flesh. By Heyne's advice, he now worked hard at Latin, which he knew far less thoroughly than Greek, and we soon find Heyne praising his progress in Latin style to both Ruhnken and Valckenaer. He now wrote to ask their advice about his scheme of coming to the Netherlands to follow the profession of a scholar. Ruhnken strongly exhorted Wyttenbach to follow his own example, for he too had been designed by his parents for the Christian ministry in Germany, but had settled at Leyden on the invitation of Hemsterhuis. Valckenaer's answer was to the same effect, but he added that Wyttenbach's letter would have been pleasanter to him had it been free from excessive compliments. These letters were forwarded to the elder Wyttenbach, with a strong recommendation from Heyne. The old man had been himself in Leyden in his youth, and entertained an admiration for the scholarship of the Netherlands; so his consent was easily won. Young Wyttenbach reached Leyden in 1770. According to his own description, he approached the gates of the city with a feeling of religious awe such as might have passed over an ancient visitant to Athens and the Acropolis. As he neared Ruhnken's door, the words of Homer "surely there is some god within" were in his mind. He was delighted to find the great man entirely free from the pomposity and assumption which had made many of the German professors disagreeable to him. A year was spent with great contentment, in learning the language of the people, in attending the lectures of the great "duumviri" of Leyden, and in collating MSS. of Plutarch. At the end of 1771 a professor was wanted at Amsterdam for the College of the Remonstrants. By the recommendation of Ruhnken, Wyttenbach obtained the chair, which he filled with great success for eight years. His lectures took a wide range. Those on Greek were repeated also to the students of the university of Amsterdam (the "Athenæum"). In 1775 a visit was made to Paris, which was fruitful both of new friendships and of progress in study. About this time, on the advice of Ruhnken, Wyttenbach began the issue of his *Bibliotheca Critica*, which appeared at intervals for the next thirty years. The object professed in the preface was to help in rescuing classical studies from the neglect into which they had fallen, by creating an interest in new works of merit, through critical notices, embodying the results of original research by the writer himself. It was in fact a kind of critical review written by one man. The methods of criticism employed were in the main those established by Hemsterhuis, and carried on by Valckenaer and Ruhnken, and the publication met with acceptance from the learned all over Europe. In 1777 the younger Burmann ("Burmannus Secundus") retired from his professorship at the Athenæum, and Wyttenbach hoped to succeed him. When another received the appointment, he was sorely discouraged. Only his regard for Ruhnken and for Dutch freedom (in his own words "Ruhnkeni et Batavæ libertatis cogitatio") kept him in Holland. For fear of losing him the authorities at Amsterdam nominated him in 1779 professor of philosophy. Some of his lectures given in this capacity were worked up for publication; in particular a treatise on logic belongs to this period. In philosophy Wyttenbach never shook off the influence of Wolff, and the Kantians were irate because he failed to appreciate their master. In 1785 Toll, Burmann's successor, resigned,

and Wyttenbach was at once appointed to succeed him. His full title was "professor of history and eloquence and Greek and Latin literature." He had hardly got to work in his new office when Valckenaer died, and he received a call to Leyden. Greatly to Ruhnken's disappointment, he declined to abandon the duties he had so recently undertaken. In 1787 began the internal commotions in Holland, afterwards to be aggravated by foreign interference. Scarcely during the remaining thirty-three years of Wyttenbach's life was there a moment of peace in the land. He held entirely aloof from factions, and yearned continually after quiet and reconciliation. About this time two requests were made to him for an edition of the *Moralia* of Plutarch, for which a recension of the tract "De sera numinis vindicta" had marked him out in the eyes of scholars. One request came from the famous "Societas Bipontina," the other from the delegates of the Clarendon Press at Oxford. Wyttenbach, influenced at once by the reputation of the university, and by the liberality of the Oxonians in tendering him assistance of different kinds, declined the offer of the Bipontine Society,—very fortunately, since their press was soon destroyed by the French. The fortunes of Wyttenbach's edition curiously illustrate the text "habent sua fata libelli." The first portion was safely conveyed to Oxford in 1794. Then war broke out between Holland and Great Britain. Randolph, Wyttenbach's Oxford correspondent, advised that the next portion should be sent through the British ambassador at Hamburg, and the MS. was duly consigned to him "in a little chest well protected by pitch." After sending Randolph a number of letters without getting any answer, Wyttenbach in disgust put all thought of the edition from him, and a shudder ran through his frame whenever Plutarch was mentioned. At last, after simultaneous letters had been despatched to a good many delegates of the Clarendon Press, the missing box was discovered in a forgotten corner at Hamburg, where it had lain for two years and a half. The work was finally completed in 1805. Meanwhile Wyttenbach received repeated invitations to leave Amsterdam, which were refused. One came from his native city Bern, another from Leyden, where vacancies had been created by the refusal of professors to swear allegiance to the new Dutch republic set up in 1795, in which Wyttenbach had acquiesced. But he only left Amsterdam in 1799, when on Ruhnken's death he succeeded him at Leyden. Even then his chief object in removing was to facilitate an arrangement by which the necessities of his old master's family might be relieved. His removal came too late in life, and he was never so happy at Leyden as he had been at Amsterdam. Before long appeared the ever-delightful *Life of David Ruhnken*. Though written in Latin, this biography deserves to rank high in the modern literature of its class. It is composed in a style that is lucid, flowing, and graceful, not imitated from any one ancient author, but (a few grammatical matters apart) such as we can imagine that some gifted Roman of the classical time might well have struck out for himself. One of Ruhnken's friends called it "a Milesian tale," partly from the fascination of the style, and partly because the book often took such a wide range that Ruhnken was lost amid extended observations springing out of his relation to the classical studies of his age. Of Wyttenbach's life at Leyden there is little to tell. The continual changes in state affairs greatly disorganized the universities of Holland, and Wyttenbach had to work in face of much detraction; still his success as a teacher was very great. In 1805 he narrowly escaped with his life from the great gunpowder explosion, which killed 150 people, among them the Greek scholar Luzac, Wyttenbach's colleague in the university. One of Wyttenbach's letters gives a vivid account of the disaster. During the last years of his life he suffered severely from illness and became nearly blind. After the conclusion of his edition of Plutarch's *Moralia* in 1805, the only important work he was able to publish was his well-known edition of Plato's *Phædo*. Many honors were conferred upon him both at home and abroad, and in particular he was made a member of the French Institute. Shortly before his death, he obtained the license of the king of Holland to marry his sister's daughter, Johanna Gallien, who had for twenty years devoted herself to him as housekeeper, secretary, and aider in his studies. The sole object of the marriage was to secure for her a better provision after her husband's death, because as the widow of a professor she would be entitled to a pension. Johanna Gallien was a woman of remarkable culture and ability, and wrote works held in great repute at that time. On the festival of the tercentenary of the foundation of the university of Marburg, celebrated in 1827, the degree of doctor was conferred upon her. Wyttenbach died of apoplexy in 1820, and he was buried in the garden of his country house near Amsterdam, within sight, as he noted, of the dwellings of Descartes and Boerhaave.

Although his work can hardly be set on the same level as that of Hemsterhuis, Valckenaer, and Ruhnken, yet he was a very eminent exponent of the sound methods of criticism which they established. These four men, more than any others after Bentley, laid the foundations of Greek scholarship as it exists to-day. The precise study of grammar, syntax, and style, and the careful criticism of texts by the light of the best manuscript evidence, were upheld by these scholars in the Netherlands when they were almost entirely neglected elsewhere on the Continent, and were only pursued with partial success in England. Wyttenbach may fairly be regarded as closing a great period in the history of scholarship. He lived indeed to see the new birth of German classical learning, but his work was done, and he was unaffected by it. Wyttenbach's criticism was less rigorous, precise, and masterly, but perhaps more sensitive and sympathetic than that of his great predecessors in the Netherlands. In actual acquaintance with the philosophical writings of the ancients, he has probably never been surpassed. In character he was upright and simple-minded, but shy and retiring, and often failed to make himself appreciated. His life was not passed without strife, but his few friends were warmly attached to him, and his many pupils were for the most part his enthusiastic admirers. Wyttenbach's biography was written in a somewhat dry and lifeless manner by Mahne, one of his pupils, who also published some of his letters. His *Opuscula*, other than those published in the *Bibliotheca Critica*, were collected in two volumes (Leyden, 1823). (J. S. R.)

X.

X represents the Phœnician letter Samekh, to which the old Ionian Ξ is singularly close in form. This form is familiar to Greek students, because it belongs to the alphabet that superseded the alphabet of the Eubœan type which was first in use at Athens. But the Eubœan form of the letter was + (see Roehl, *I.G.A.*, No. 372); and this form went with the Eubœan alphabet of Chalcis to the western Hellenic world, and passed in Italy into the form X, which survives with us. The history of the symbol in Italy is not, however, perfectly clear, because in the extremely archaic alphabets of Cære and Formello we find not only + but also a symbol ⊞, and this has the place of *Xi* in the Ionian alphabet, whereas + stands after U, instead of in its proper place, which has been thus usurped by this huge and otherwise unknown in-

truder. There would be no difficulty in supposing that + is only a curtailed portion of the fuller form, and that the two survived for a time side by side in the alphabet, perhaps with some differentiation of value, were it not that this is inconsistent with the ultimate derivation of the Italic alphabet from Chalcis, where the large form certainly does not appear. The name *Xi* (ksi) is clearly Greek, not, like the names of the letters in general, borrowed from the Phœnician. It is obviously modelled upon Psi, just as Psi was itself modelled upon Pi. The value of the sound in Phœnician was probably a strong sibilant, with a weak guttural preceding. In the old inscriptions of the Ægean Islands —Thera, Naxos, etc.—we find a double symbol ΚΜ (*i.e.*, *ks*); in Naxos we find also ΧΣ and ΒΣ (*i.e.*, *hs*), which indicates a guttural breathing before the *s;* and in old Attic inscriptions also we find ΧΣ.

But this same symbol X had another very different value in Greece from *ks*, and by this value, *i.e.*, a guttural aspirate, *kh* or *ch*, it is familiar to Greek students under the name Chi. This value is confined to alphabets of the Ionian type. In the islands we find ΚΒ or ΚΗ, also ΦΒ at Thera, digraphs being employed in the same manner as for *ks* and *ps*. This same guttural sound is represented in alphabets of the Eubœan type under the form Ψ or Ψ, which appears naturally in the Cære alphabet, but in the derived Italian alphabets was retained by the Etruscan only. In Greece it was found in Bœotia and the Peloponnesus: *e.g.*, it appears on the tripod at Delphi set up by the Lacedæmonians to commemorate the victory of Platææ. But in the Ionic alphabet alone this same symbol has a totally different value, to wit, *ps*, and to this value the Greeks gave the name Psi. It is noteworthy that the old Attic way of writing this double sound was ΦΣ. The origin of this second X and that of its companion Ψ is very uncertain. The Attic writings above mentioned, and the ΦΒ of Thera, give color to the idea that X and Φ may be survivals of a ruder alphabet, superseded by the Phœnician, with the values *k* and *p*. On the other hand, it does not seem impossible that Ψ, with the value *ch*, may be a descendant of the useless Ϙ (koppa), obtained by opening out the circle (Taylor, *Alphabet*, ii. 93); but the same writer maintains that X is a variation of K, which seems very improbable. It is at least as credible that it is a variant of Samekh, in which the guttural element of the original complex sound superseded the sibilant.

There is nothing noteworthy in the history of *x* in English. In French, when medial, it has generally passed into *ss*, as in *laisser* (from *laxare*); and it has the same sound, even when written, as in *soixante*. It is frequently found at the end of words owing to a miswriting, the contraction for final *us* having been confounded with it, as in plurals, *yeux*, *animaux*, etc., where the *u* has been added again, also in *époux* (esponsus), *faux* (falsus), *roux* (russus), etc. Not unnaturally the *x* has been substituted still further, as in *prix;* in other cases, like *croix*, we have probably a learned imitation of the Latin. Italian also substitutes *ss* for *x*, as in *massimo* for *maximus*, *lussuria*, etc. On *x* in Spanish, see vol. xxii. p. 364.

XALAPA. See JALAPA.

XANTHUS, an ancient city of LYCIA (*q.v.*), on the river Xanthus, about 8 miles above its mouth. It is chiefly memorable in history for its two sieges, and the desperate but unavailing resistance made on both occasions. The first siege was by the Persian general Harpagus (see vol. xviii. p. 578), when the acropolis was burned and the inhabitants, with all their possessions, perished (Herod., i. 176). The city was afterwards rebuilt; and in 42 B.C. it was besieged by the Romans under Brutus. It was taken by storm and set on fire; and the inhabitants, refusing to surrender, all perished in the flames. During its prosperity, Xanthus contained many fine temples and other buildings, extensive remains of which, in excellent preservation, were discovered by Sir C. Fellows (*Excursion in Asia Minor*, 1839). A large collection of marbles, chiefly sepulchral, from Xanthus is now in the British Museum.

XAVIER, FRANCISCO (1506–1552), surnamed the "Apostle of the Indies," was the youngest son of Juan de Jasso, privy councillor to Jean d'Albret, king of Navarre, and his wife Maria Azpilcueta Xavier, sole heiress of two noble Navarrese families. He was born at his mother's castle of Xavero or Xavier, at the foot of the Pyrenees and close to the little town of Sanguesa, on 7th April, 1506, according to a family register, though his earlier biographers fix his birth in 1497. Following a Spanish custom of the time, which left the surname of either parent optional with children, he was called by his mother's family name, and grew up tall, strong, healthy, and active both in mind and body, with a lively, cheerful disposition. He showed no taste, however, for the career of arms, and early disclosed a preference for literary pursuits. His father accordingly strained his slender resources to send him, in 1524, to the university of Paris, then much frequented by Spaniards, where he entered the College of St. Barbara, and made such rapid progress that he was appointed in 1528 lecturer in Aristotelian philosophy at the Collége de Beauvais. In 1530 he took his degree as master of arts. The same year which saw his nomination as lecturer at the university saw also the arrival there of the man who was to mould his destiny and that of his chamber-mate Pierre le Fèvre, namely, Ignatius Loyola, even then meditating the foundation of his celebrated institute (see JESUITS, vol. xiii. pp. 657–8), Ignatius speedily recognized in Xavier the qualities which made him the first missionary of his time,—and set himself to win him as an associate in his vast enterprise. Xavier, after a protracted resistance, yielded to the spell, and was one of the little band of seven persons, including Loyola himself, who took the original Jesuit vows and founded the company, on 15th August, 1534, in the crypt of Notre Dame de Montmartre. They continued in Paris for two years longer, though there is some uncertainty whether Xavier retained his chair; but on 15th November, 1536, they started for Italy, to concert with Ignatius (then in Spain, but purposing to join them) plans for a mission to convert the Moslems of Palestine. About Epiphany-tide, 1537, after a journey attended with much fatigue and some danger, owing to the disturbed posture of political affairs, they arrived in Venice, where they found Ignatius awaiting them. As some months must needs elapse before they could sail for the Holy Land, Ignatius determined that the time should be spent partly in hospital work at Venice and later in the journey to Rome, there to obtain their credentials. Accordingly, Xavier devoted himself for nine weeks to the care of the patients in the hospital for incurables, at the end of which time he set out with eight companions for Rome, where Pope Paul III. received them favorably, sanctioned their enterprise, and gave them facilities for obtaining ordination. Returning to Venice, Xavier was ordained priest on Midsummer Day, 1537; but the outbreak of war between Venice and Turkey put an end to the Palestine expedition. Hereupon the companions agreed to disperse for a twelve-month's home mission work in the Italian cities, and Bobadilla and Xavier betook themselves, first to Monselice, thence to Bologna, where they remained till summoned to Rome by Ignatius at the close of 1538, to consider his plans for erecting the company into a religious order, with a formal constitution under papal sanction. The draft rules were signed by the whole number on 15th April, 1539, though it was not till 1540 that the pope's confirmation was given, nor was it published till 1541. While the remaining members dispersed anew for work in various parts of Italy, Ignatius retained Xavier at Rome as secretary to the new institute. Meanwhile John III., king of Portugal, had resolved on sending a mission to his East Indian dominions, and, at the instance of his

minister Govea, applied through his envoy Pedro de Mascarenhas to the pope for six Jesuits to undertake the task. Ignatius could spare but two, and chose Rodriguez and Bobadilla for the purpose; and the former set out at once for Lisbon to confer with the king. Bobadilla, sent for to Rome, arrived there just before Mascarenhas was about to depart, but fell too ill to respond to the call made on him. Hereupon Ignatius on 15th March, 1540, told Xavier to leave Rome the next day with Mascarenhas, in order to join Rodriguez in the Indian mission. Xavier complied, merely waiting long enough to obtain the pope's benediction, and set out for Lisbon, where he was presented to the king, and soon won his entire confidence, attested notably by procuring for him from the pope four briefs, one of them appointing him papal nuncio in the Indies. On 7th April, 1541, his thirty-fifth birthday, he sailed from Lisbon with Martin Alphonso de Souza, governor of India, and refusing all accommodations for the voyage offered him, except a few books and some clothing, lived amongst the common sailors on board, ministering to their religious and temporal needs, especially during an outbreak of scurvy. After five months' voyage the ship reached Mozambique, where the captain resolved to winter, and Xavier was prostrated with a severe attack of fever. When the voyage was resumed, the ship touched at the Mohammedan town of Melinde, whose sultan told Xavier of the marked decline of Islam. But neither there nor at the island of Socotra, the next point of arrival, where Christianity was equally declining, was the missionary able to remain long enough to attempt any work; and he finally reached Goa on 6th May, 1542. Exhibiting his brief to João d' Albuquerque, bishop of Goa, he asked his permission to officiate in the diocese, and at once began a mission, walking through the streets ringing a small bell, and telling all those attracted by its sound to come themselves, and send their children and servants, to the "Christian doctrine" or catechetical instruction in the principal church. He spent five months actively employed in Goa, where he is stated to have effected much reformation in morals, and then turned his attention to the fishery coast, extending from Cape Comorin to the Paumbum Pass, where he had heard that the Paravas, a tribe engaged in the pearl-fishery, had relapsed into heathenism after having professed Christianity. He labored assiduously amongst them for fifteen months, and at the end of 1543 returned to Goa to procure colleagues for the mission. Travancore was his next field of action, and there he is said to have succeeded in founding no fewer than forty-five Christian settlements, each with numerous converts. It is to be noted that his own letters contain, both at this time and later on, express disproof of his possession of that miraculous gift of tongues with which he was credited even in his lifetime, and which is attributed to him in the *Breviary* office for his festival. Not only was he obliged to employ interpreters, but he relates that in their absence he was compelled to use signs only, and he never appears to have displayed any special aptitude for acquiring new languages. He sent a missionary to the isle of Manaar, and himself visited Ceylon, where he proved unsuccessful in an effort to invoke Portuguese interference in a dynastic dispute, and betook himself thence to Meliapur, the traditionary tomb of St. Thomas the apostle, which he reached in April, 1544, continuing there four months. His next sphere of active work was Malacca, which he reached on 25th September, 1545, and where he remained another four months, but had comparatively little success, and abandoned it at last as wholly intractable. While there he addressed a letter to King John of Portugal, urging him to set up the Inquisition in Goa to repress Judaism, and was readily listened to, although the actual erection of the tribunal did not take place till 1560, some years after his own death. After a missionary expedition to Amboyna and other isles of the Molucca group, he returned to Malacca in July, 1547, and found three Jesuit recruits from Europe awaiting him. An attack upon Malacca by the sultan of Acheen, which the governor was disinclined to punish, aroused the warlike temper which slumbered in Xavier's breast, and he compelled the organization of an expedition to chastise the invaders, which proved a triumph and much increased his local influence. While in Malacca he met one Han-Siro, a Japanese exile (known to the biographies as Anger), whose conversation fired him with zeal for the conversion of Japan. But he first paid a series of visits to the scenes of his former labors, and then, returning to Malacca, took ship for Japan, accompanied by Han-Siro, now known as Paul of the Holy Faith. After a perilous voyage they reached Kagoshima, at the south of Kiusiu, the southernmost of the larger Japanese islands, and in the territory of the daimio of Satsuma. Kagoshima was Han-Siro's birthplace, and he was himself heartily welcomed by his friends, whom he induced to extend their good-will to his companions. The daimio, who desired to secure the Portuguese trade, was friendly at first; but, finding that the merchant vessels preferred the safer anchorage of Firando (or Hirado) far to the north of his fief, he withdrew his permission to preach and threatened converts with the penalty of death. Xavier judged it well to move elsewhither, and travelled on foot to Firando, making some converts on the road, and proving far more successful at Firando itself than in Kagoshima. Thence he proceeded to the capital of the empire, the city then known as Miako, subsequently as Kioto, and now as Saikio or "western capital." But the mikados or emperors had been little more than puppets under the control of the shoguns or hereditary commanders-in-chief for some centuries before this time, so that Xavier judged that he could work more effectually at the courts of the great daimios than at that of their nominal sovereign. He also noticed that asceticism and poverty had no such attractive power in Japan as they had exercised in India, and determined to try the effect of some measure of pomp and display on his return from Miako. Making but a brief stay at Firando, he went to Amanguchi (Yamaguchi), capital of Suwo, and there presented himself to the daimio in some state, bringing him valuable presents. He was allowed to preach, and had some success, which encouraged him to proceed to Fucheo, capital of the fief of Bungo (Bugo), where his mission prospered more than anywhere else in Japan; and, feeling that he could now safely leave the work in other hands, he quitted that empire in 1551, intending to attempt next the conversion of China. On board the "Santa Cruz," the vessel in which he sailed to Malacca, he discussed this project with Diego Pereira, the captain, and devised the plan of persuading the viceroy of Portuguese India to despatch an embassy to China, in whose train he might enter, in spite of the law which then excluded foreigners from that empire. He reached Goa in February, 1552, and after settling some disputes which had arisen in his absence obtained from the viceroy consent to the plan of a Chinese embassy and to the nomination of Pereira as envoy. Large sums for the necessary expenses were contributed by the treasury, by Pereira himself, and by subscriptions from private persons interested in the missionary part of the scheme. Xavier left India on 25th April, 1552, and betook himself to Malacca, there to meet Pereira and to re-embark on the "Santa Cruz." But Alvaro d'Ataide, governor of Malacca, had a private grudge against Pereira, and besides desired the Chinese embassy for himself, and therefore threw difficulties in the way of the expedition, though Xavier, anticipating something of the kind, had procured for him the high office of captaincy of the neighboring seas, and had also provided himself with stringent orders from the viceroy for the furtherance of his object, with threats of punishment for disobedience. Ataide, however, paid no attention to

them, and laid an embargo on the "Santa Cruz." Xavier, who with characteristic modesty had kept his dignity as papal nuncio private (save for exhibiting the brief to the bishop at Goa on his first arrival in India), determined to avail himself of it now, and desired the vicar-general of Malacca to inform the governor, and to remind him that such as impeded a nuncio in the discharge of his office were subject to excommunication by the pope himself. Ataide paid no more regard to the papal brief than he had done to the viceroy's letter, and even charged Xavier with having forged it,—if not both documents,—while the people of Malacca sided with him against Xavier and Pereira. At last, however, he agreed to a compromise. The embassy was stopped and Pereira detained, while some of the governor's people were substituted for as many of the crew of the "Santa Cruz," in which Xavier and two companions were allowed to proceed. The vicar-general asked him to take formal leave of the governor; but he refused, saying that they would meet no more till the day of judgment, when Ataide must give account for his resistance to the spread of the gospel, and, shaking the dust of Malacca from his shoes, he embarked 16th July, 1552. After a short stay at Singapore, whence he despatched several letters to India and Europe, the ship at the end of August, 1552, reached San-chan (Chang-chuang), an island at no great distance from Canton, which served as port and rendezvous for Europeans, not then admitted to trade directly with China. Xavier was seized with fever soon after his arrival, and was, in addition, delayed by the failure of the interpreter he had engaged, as well as by the reluctance of the Portuguese to attempt the voyage to Canton for the purpose of landing him. He arranged for his passage in a Chinese junk and had made all other preparations for starting, when he was again attacked by fever, and died on 2d December, 1552. He was buried close to the cabin where he had died, but his body was later transferred to Malacca, and thence to Goa, where it still lies. He was beatified by Paul V. in 1619 and canonized by Gregory XV. in 1621.

The chief authorities for the life of St. Francis Xavier are *De Vita Sancti Francisci Xaverii Libri VI.*, by the Jesuit Torsellino (Tursellinus), Rome, 1596, of which there is a vigorous English version, Paris, 1632; another biography by Lucena, Lisbon, 1600; his *Letters*, published in seven books by the Jesuit Poussines (Possinus), Rome, 1667; a fuller collection of the *Letters* by another Jesuit, Menchacha, Bologna, 1795, translated into French by Léon Pagès, Paris, 1854; Faria y Souza, *Asia Portuguesa*, Lisbon, 1655; Bouhours, *Vie de St. François Xavier*, Paris, 1684; Bartoli, *Asia*, part i., Rome, 1653; H. J. Coleridge, *Life and Letters of St. Francis Xavier*, London, 1872; while a graphic sketch of the more striking episodes is to be found in Sir James Stephen's article on the "Founders of Jesuitism," reprinted in his *Essays in Ecclesiastical Biography*, London, 1849. (R. F. L.)

XENIA, a city of the United States, the county seat of Greene county, Ohio, is situated in the midst of a rich agricultural region, and on the Pittsburgh, Cincinnati, and St. Louis and the Dayton, Fort Wayne, and Chicago Railways. It is one of the oldest cities of Ohio, having been laid out in 1803. It is the seat of the Methodist Episcopal Xenia college (1850), a Presbyterian theological seminary (1794), and Wilberforce university (1863), this last designed for the education of colored youth of both sexes. The population in 1880 was 7026.

XENOCRATES of Chalcedon, scholarch or rector of the Academy from 339 to 314 B.C., was born in 396. Removing to Athens in early youth, he became the pupil of the Socratic Æschines, but presently joined himself to Plato, whom he attended to Sicily in 361. Upon his master's death (347 B.C.), in company with Aristotle he paid a visit to Hermias at Atarneus. In 339, Aristotle being then in Macedonia, Xenocrates succeeded Speusippus in the presidency of the school, defeating his competitors Menedemus and Heracleides by a few votes. On three occasions he was member of an Athenian legation, once to Philip, twice to Antipater. Soon after the death of Demosthenes in 322, resenting the Macedonian influence then dominant at Athens, Xenocrates declined the citizenship offered to him at the instance of Phocion, and, being unable to pay the tax levied upon resident aliens, was, it is said, sold, or on the point of being sold, into slavery. He died in 314, and was succeeded as scholarch by Polemon, whom he had reclaimed from a life of profligacy. Besides Polemon, the statesman Phocion, Chæron tyrant of Pellene, the Academic Crantor, the Stoic Zeno, and Epicurus are alleged to have frequented his lectures.

Xenocrates's earnestness and strength of character won for him universal respect, and stories were remembered in proof of his purity, integrity, and benevolence. Wanting in quickness of apprehension and in native grace, he made up for these deficiencies by a conscientious love of truth and an untiring industry. Less original than Speusippus, he adhered more closely to the letter of Platonic doctrine, and is accounted the typical representative of the Old Academy. In his writings, which were numerous, he seems to have covered nearly the whole of the Academic programme; but metaphysics and ethics were the subjects which principally engaged his thoughts. He is said to have invented, or at least to have emphasized, the tripartition of philosophy under the heads of physic, dialectic, and ethic.

In his ontology Xenocrates built upon Plato's foundations: that is to say, with Plato he postulated ideas or numbers to be the causes of nature's organic products, and derived these ideas or numbers from unity (which is active) and plurality (which is passive). But he put upon this fundamental dogma a new interpretation. According to Plato, existence is mind pluralized: mind as a unity, *i.e.*, universal mind, apprehends its own plurality as eternal, immutable, intelligible ideas; and mind as a plurality, *i.e.*, particular mind, perceives its own plurality as transitory, mutable, sensible things. The idea, inasmuch as it is a law of universal mind, which in particular minds produces aggregates of sensations called things, is a "determinant" (*πέρας ἔχον*), and as such is styled "quantity" (*ποσόν*) and perhaps "number" (*ἀριθμός*); but the ideal numbers are distinct from arithmetical numbers, and the elements of ideal numbers from the elements of arithmetical numbers. Xenocrates, however, failing, as it would seem, to grasp the idealism which was the metaphysical foundation of Plato's theory of natural kinds, took for his principles arithmetical unity and plurality, and accordingly identified ideal numbers with arithmetical numbers. In thus reverting to the crudities of certain Pythagoreans he laid himself open to the criticisms of Aristotle, who, in his *Metaphysics*, recognizing amongst contemporary Platonists three principal groups—(1) those who, like Plato, distinguished mathematical and ideal numbers; (2) those who, like Xenocrates, identified them; and (3) those who, like Speusippus, postulated mathematical numbers only—has much to say against the Xenocratean interpretation of the theory, and in particular points out that, if the ideas are numbers made up of arithmetical units, they not only cease to be principles but also become subject to arithmetical operations. Xenocrates's theory of inorganic nature was substantially identical with the theory of the elements which is propounded in the *Timæus*, 53 C *sq.* Nevertheless, holding that every dimension has a principle of its own, he rejected the derivation of the elemental solids—pyramid, octahedron, icosahedron, and cube—from triangular surfaces, and in so far approximated to atomism. Moreover, to the tetrad of simple elements—namely, fire, air, water, earth—he added the *πέμπτη οὐσία*, ether.

His cosmology, which is drawn almost entirely from the *Timæus*, and, as he intimated, is not to be regarded as a cosmogony, should be studied in connection with its psychology. Soul is a self-moving number, derived from the two fundamental principles, unity (*ἕν*) and plurality (*δυὰς ἀόριστος*), whence it obtains its powers of rest and motion. It is incorporeal, and may exist apart from body. The irrational soul, as well as the rational soul, is immortal. The universe, the heavenly bodies, man, animals, and presumably plants, are each of them endowed with a soul, which is more or less perfect according to the position which it occupies in the descending scale of creation. With this Platonic philosopheme Xenocrates combines the current theology, identifying the universe and the heavenly bodies with the greater gods, and reserving a place between them and mortals for the lesser divinities.

If the extant authorities are to be trusted, Xenocrates

recognized three grades of cognition, each appropriated to a region of its own,—namely, knowledge, opinion, and sensation, having for their respective objects supra-celestials or ideals, celestials or stars, and infra-celestials or things. Even here the mythological tendency displays itself,—*νοητά*, *δοξαστά*, and *αἰσθητά* being severally committed to Atropos, Lachesis, and Clotho. Of Xenocrates's logic we know only that with Plato he distinguished *τὸ καθ' αὑτό* and *τὸ πρός τι*, rejecting the Aristotelian list of ten categories as a superfluity.

Valuing philosophy chiefly for its influence upon conduct, Xenocrates bestowed especial attention upon ethics. The catalogue of his works shows that he had written largely upon this subject; but the indications of doctrine which have survived are scanty, and may be summed up in a few sentences. Things are goods, ills, or neutrals. Goods are of three sorts—mental, bodily, external; but of all goods virtue is incomparably the greatest. Happiness consists in the practice of virtue, the requisite powers and opportunities being presupposed. Hence the virtuous man is always happy, though his happiness cannot be perfect unless he is adequately provided with personal and extraneous advantages. The virtuous man is pure, not in act only, but also in heart. To the attainment of virtue the best help is philosophy; for the philosopher does of his own accord what others do under the compulsion of law. Speculative wisdom and practical wisdom are to be distinguished. Meagre as these statements are, they suffice to show that in ethics, as elsewhere, Xenocrates worked upon Platonic lines, and that in his theory of the relations of external advantages to happiness, as well as in the technicalities of his exposition, he closely resembled Aristotle.

Xenocrates was not in any sense a great thinker. His metaphysic was a travesty rather than a reproduction of that of his master. His ethic had little which was distinctive. But his austere life and commanding personality made him an effective teacher, and his influence, kept alive by his pupils Polemon and Crates, ceased only when Arcesilaus, the founder of the so-called Second Academy, gave a new direction to the studies of the school.

Griechen*, Leipsic, 1875, ii., 1, 840–842, 862–883; F. W. A. Mullach, *Fragmenta Philosophorum Græcorum*, Paris, 1881, iii. 100–130. (H. JA.)

XENOPHANES of Colophon, the reputed founder of the Eleatic school of philosophy, is supposed to have been born in the third or fourth decade of the 6th century B.C. An exile from his Ionian home, he resided for a time in Sicily, at Zancle and at Catana, and afterwards established himself in southern Italy, at Elea, a Phocæan colony founded in the sixty-first Olympiad (536–533). In one of the extant fragments he speaks of himself as having begun his wanderings sixty-seven years before, when he was twenty-five years of age, so that he was not less than ninety-two when he died. His teaching found expression in poems, which he recited rhapsodically in the course of his travels. In the more considerable of the elegiac fragments which have survived he ridicules the doctrine of the migration of souls (xviii.), asserts the claims of wisdom against the prevalent athleticism, which seemed to him to conduce neither to the good government of states nor to their material prosperity (xix.), reprobates the introduction of Lydian luxury into Colophon (xx.), and recommends the reasonable enjoyment of social pleasures (xxi.). Of the epic fragments the more important are those in which he attacks the "anthropomorphic and anthropopathic polytheism" of his contemporaries. According to Aristotle, "this first of Eleatic unitarians was not careful to say whether the unity which he postulated was finite or infinite, but, contemplating the whole firmament," (or perhaps "the whole world," for the word *οὐρανός* is ambiguous) "declared that the One is God." Whether Xenophanes was a monotheist, whose assertion of the unity of God *suggested* to Parmenides the doctrine of the unity of Being, or a pantheist, whose assertion of the unity of God was also a declaration of the unity of Being, so that he *anticipated* Parmenides,—in other words, whether Xenophanes's teaching was purely theological or had also a philosophical significance,—is a question about which authorities have differed and will probably continue to differ. The silence of the extant fragments, which have not one word about the unity of Being, favors the one view; the voice of antiquity, which proclaims Xenophanes the founder of Eleaticism, has been thought to favor the other.

Of Xenophanes's utterances about (1) God, (2) the world, (3) knowledge, the following survive. (1) There is one God, greatest among gods and men, neither in shape nor in thought like unto mortals. . . . He is all sight, all mind, all ear (*i.e.*, not a composite organism). . . . Without an effort ruleth he all things by thought. . . . He abideth ever in the same place motionless, and it befitteth him not to wander hither and thither. . . . Yet men imagine gods to be born, and to have senses, and voice, and body, like themselves. . . . Even so the gods of the Ethiopians are swarthy and flat-nosed, the gods of the Thracians are fair-haired and blue-eyed. . . . Even so Homer and Hesiod attributed to the gods all that is a shame and a reproach among men—theft, adultery, deceit, and other lawless acts. . . . Even so lions and horses and oxen, if they had hands wherewith to grave images, would fashion gods after their own shapes and make them bodies like to their own. (2) From earth all things are and to earth all things return. . . . From earth and water come all of us. . . . The sea is the well whence water springeth. . . . Here at our feet is the end of the earth where it reacheth unto air, but, below, its foundations are without end. . . . The rainbow, which men call Iris, is a cloud that is purple and red and yellow. (3) No man hath certainly known, nor shall certainly know, aught of that which I say about the gods and about all things; for, be that which he saith ever so perfect, yet doth he not know it; all things are matters of opinion. . . . That which I say is opinion like unto truth. . . . The gods did not reveal all things to mortals in the beginning; long is the search ere man findeth that which is better."

There is very little secondary evidence to record. "The Eleatic school," says the Stranger in Plato's *Sophist*, 242 D, "beginning with Xenophanes, and even earlier, starts from the principle of the unity of all things." Aristotle, in a passage already cited, *Metaphysics*, A5, speaks of Xenophanes as the first of the Eleatic unitarians, adding that his monotheism was reached through the contemplation of the *οὐρανός*. Theophrastus (in Simplicius's *Ad Physica*, 5) sums up Xenophanes's teaching in the propositions "The All is One and the One is God." Timon (in Sext. Empir., *Pyrrh.*, i. 224), ignoring Xenophanes's theology, makes him resolve all things into one and the same unity. The demonstrations of the unity and the attributes of God, with which the treatise *De Melisso, Xenophane, et Gorgia* (now no longer ascribed to Aristotle or Theophrastus) accredits Xenophanes, are plainly framed on the model of Eleatic proofs of the unity and the attributes of the Ent, and must therefore be set aside. The epitomators of a later time add nothing to the testimonies already enumerated.

Thus, whereas in his writings, so far as they are known to us, Xenophanes appears as a theologian protesting against an anthropomorphic polytheism, the ancients seem to have regarded him as a philosopher asserting the unity of Being. How are we to understand these conflicting, though not irreconcilable, testimonies? According to Zeller, the discrepancy is only apparent. The Greek gods being the powers of nature personified, pantheism lay nearer to hand than monotheism. Xenophanes was then a pantheist. Accordingly his assertion of the unity of God was at the same time a declaration of the unity of Being, and in virtue of this declaration he is entitled to rank as the founder of Eleaticism, inasmuch as the philosophy of Parmenides was his forerunner's pantheism divested of its theistic element. This reconciliation of the internal and the external evidence, countenanced as it is by Theophrastus, one of the best-informed of the ancient historians, and approved by Zeller, one of the most acute of the modern critics, is more than plausible; but there is something to be said on the contrary part. In the first place, it may be doubted whether to a Greek of the 6th century pantheism was nearer than monotheism. Secondly, the external evidence does not bear examination. The Platonic testimony, if it proved anything, would prove too much, namely, that the doctrine of the unity of Being originated, not with Xenophanes, but before him; and, in fact, the passage from the *Sophist* no more proves that Plato attributed to Xenophanes the philosophy of Parmenides than *Theætetus*, 160 D, proves that Plato attributed to Homer the philosophy of Heraclitus. Again, Aristotle's description of Xenophanes as the first of the Eleatic unitarians does not necessarily imply that the unity asserted by Xenophanes was the unity asserted by Parmenides; the phrase, "contemplating the firmament (or the world), he declared that the One is God," leaves it doubtful whether Aristotle attributed to Xenophanes any philosophical theory whatever; and the epithet *ἀγροικότερος* discourages

the belief that Aristotle regarded Xenophanes as the author of a new and important departure. Thirdly, when Xenophanes himself says that his theories about gods and about things are not knowledge, that his utterances are not verities but verisimilitudes, and that, so far from learning things by revelation, man must laboriously seek a better opinion, he plainly renounces the "disinterested pursuit of truth." If then he was indifferent to the problem, he can hardly be credited with the Eleatic solution. In the judgment of the present writer, Xenophanes was neither a philosopher nor a skeptic. He was not a philosopher, for he despaired of knowledge. He was not a skeptic, if by "skeptic" is meant the misologist whose despair of knowledge is the consequence of disappointed endeavor, for he had never hoped. Rather he was a theologian who arrived at his theory of the unity of God by the rejection of the contemporary mythology. But, while he thus stood aloof from philosophy, Xenophanes influenced its development in two ways; first, his theological monism led the way to the philosophical monism of Parmenides and Zeno; secondly, his assertion that so-called knowledge was in reality no more than opinion taught his successors to distinguish knowledge and opinion, and to assign to each a separate province.

Apart from the old controversy about Xenophanes's relations to philosophy, doubts have recently arisen about his theological position. In fragments i., xiv., xvi., xxi., etc., he recognizes, thinks Freudenthal, a plurality of deities; whence it is inferred that, besides the One God, most high, perfect, eternal, who, as immanent intelligent cause, unifies the plurality of things, there were also lesser divinities, who govern portions of the universe, being themselves eternal parts of the one all-embracing Godhead. Whilst it can hardly be allowed that Xenophanes, so far from denying, actually affirms a plurality of gods, it must be conceded to Freudenthal that Xenophanes's polemic was directed against the anthropomorphic tendencies and the mythological details of the contemporary polytheism rather than against the polytheistic principle, and that, apart from the treatise *De Melisso, Xenophane, et Gorgia*, now generally discredited, there is no direct evidence to prove him a consistent monotheist. The wisdom of Xenophanes, like the wisdom of the Hebrew Preacher, showed itself, not in a theory of the universe, but in a sorrowful recognition of the nothingness of things and the futility of endeavor. His theism was a declaration not so much of the greatness of God as rather of the littleness of man. His cosmology was an assertion not so much of the immutability of the One as rather of the mutability of the Many. Like Socrates, he was not a philosopher, and did not pretend to be one; but, as the reasoned skepticism of Socrates cleared the way for the philosophy of Plato, so did Xenophanes's "abnormis sapientia" for the philosophy of Parmenides.

Philos.*, Berlin, 1871, i. § 17. See also art. PARMENIDES. (H. JA.)

XENOPHON, Greek historian and essayist, was born at Athens about 430 B.C.[1] He was a citizen of good position, belonging to the order of the knights. Early in life he came under the influence of Socrates. In 401 B. C., being invited by his friend Proxenus to join the expedition of the younger Cyrus against his brother, Artaxerxes II. of Persia, he jumped at the offer, for he was a needy man, and his prospects at home may not have been very good, as the knights were at this time out of favor from having supported the Thirty Tyrants. At the suggestion of Socrates Xenophon went to Delphi to consult the oracle; but his mind was already made up, and he at once crossed to Asia, to Sardis, the place of rendezvous. He joined neither as officer nor as soldier; he went simply to see new countries and peoples out of a spirit of curiosity and love of excitement. Of the expedition itself he has given a full and detailed account in his *Anabasis*, or the "Up-Country March." (See PERSIA, vol. xviii. p. 588). After the battle of Cunaxa the officers in command of the Greeks were treacherously murdered by the Persian satrap Tissaphernes, with whom they were negotiating an armistice with a view to a safe return. The army was now in the heart of an unknown country, more than a thousand miles from home, and in the presence of a troublesome enemy. It was decided to march northwards up the Tigris valley and make for the shores of the Euxine, on which there were several Greek colonies. Xenophon became the leading spirit of the army; he was elected an officer, and he it was who mainly directed the retreat. To his skill, good temper, and firmness the Greeks seem to have largely owed their safety. He seems indeed to have been an Athenian of the best type, having tact and sympathy, with a singular readiness of resource and a straightforward business-like eloquence which could both persuade and convince. All through the perils and hardships of the retreat he shared the men's privations. Part of the way lay through the wilds of Kurdistan, where they had to encounter the harassing guerilla attacks of savage mountain tribes, and part through the highlands of Armenia and Georgia. After a five months' march they reached Trapezus (Trebizond) on the Black Sea (February, 400 B.C.), having given splendid proof of what Greek discipline and spirit could accomplish. When they reached the Euxine a tendency to demoralization began to show itself, and even Xenophon almost lost his control over the soldiery. At Cotyora he aspired to found a new colony; but the idea, not being unanimously accepted, was abandoned, and ultimately Xenophon with his Greeks arrived at Chrysopolis (Scutari) on the Bosphorus, opposite Byzantium. After a brief period of service under a Thracian chief, Seuthes, they were finally incorporated in a Lacedæmonian army which had crossed over into Asia to wage war against the Persian satraps Tissaphernes and Pharnabazus, Xenophon going with them. Near Pergamum he captured a wealthy Persian nobleman with his family, and the ransom paid for his recovery seems to have been sufficient to provide Xenophon with a fair competency.

On his return to Greece Xenophon served under Agesilaus, king of Sparta, which state was at this time at the head of the Greek world. With his native Athens and its general policy and institutions he was not in sympathy. At Coronea he fought with the Spartans against the Athenians and Thebans, for which his fellow-citizens decreed his banishment. The exile found a home at Scillus in Elis, about two miles from Olympia; there he settled down to indulge his tastes for sport and for literature. It was probably at Scillus that he wrote most of his books; there too he built and endowed a temple to Artemis, modelled on the great temple at Ephesus. After Sparta's great defeat at Leuctra in 371 B.C., which fatally shattered its ascendency, Xenophon was driven from his home by the people of Elis. Meantime Sparta and Athens had become allies, and the Athenians repealed the decree which had condemned Xenophon to exile. There is, however, no evidence that he ever returned to his native city. According to the not very trustworthy authority of his biographer (Diogenes Laertius), he made his home at Corinth. He was still living in 357 B.C.;[2] but how much longer he lived we have no means of knowing.

The *Anabasis* is a work of singular interest, and is brightly and pleasantly written. Xenophon, like Cæsar, tells the story in the third person, and there is a straightforward manliness about the style, with a distinct flavor of a cheerful lightheartedness, which at once enlists our sympathies. His description of places and of relative distances is very minute and painstaking. The researches of modern travellers attest his general accuracy.[3]

[1] The story that he was present at the battle of Delium in 424 B.C. which would carry back the date of his birth to 444 or 443, is now generally rejected, as it is impossible to reconcile it with his own statements about himself in the *Anabasis*, implying that in 401 B.C. he was a comparatively young man,—we may fairly assume not over thirty years of age.

[2] In the *Hellenics* (vi. 4, 37) he mentions Tisiphonus, who succeeded Alexander, tyrant of Pheræ, in 357 B.C.

[3] Major Milligan, in his *Wild Life among the Koords*, says, "My researches have put beyond doubt the accuracy of his statements,

The *Cyropædia*, which describes the boyhood and training of Cyrus, hardly answers to its name, being for the most part an account of the beginnings of the Persian empire and of the victorious career of Cyrus its founder. But Xenophon had little or nothing to build on except the floating stories and traditions of the East that had gathered round the figure of the great Persian hero-king. The *Cyropædia* contains in fact the author's own ideas of training and education, as derived conjointly from the teachings of Socrates and his favorite Spartan institutions. A distinct moral purpose, to which literal truth is sacrificed, runs through the work.

The *Hellenica*, though by no means a first-class historical work, fills a gap by giving the events of the fifty years from 411 to 362 B.C. Thus it includes the downfall of the Athenian empire, the supremacy of Sparta, and the sudden collapse of that power after Leuctra in 371 B.C. It takes up Greek history at the point at which Thucydides's great work abruptly ends. His credit as an historian has been specially impugned, and it has been suggested that he was much more influenced by his political likes and dislikes than by a love of truth. However that may be, there are certainly serious omissions and defects in the work, which greatly detract from its value. At the time he probably wrote it he was no doubt a strong political partisan and a thorough believer in Sparta. But subsequently a change came over him; and, when he described the terrible reverse at Leuctra, he seems to have felt that Sparta's prestige had been deservedly destroyed, and that its downfall was heaven's vengeance on an ungracious and treacherous policy. He always clings to a belief in a divine overruling providence, though in the *Hellenica* there are unmistakable traces of a pettiness of mind and narrowness of view very far below the dignity of an historian.

The *Memorabilia*, or "Recollections of Socrates," is the tribute of an affectionate and admiring disciple who felt that the nobleness of his master's aims and life was his best defence. The work is not a literary masterpiece: it lacks coherence and unity, and the picture it gives of Socrates fails to do him justice. Still it is an honest piece of work and a labor of love, and, as far as it goes, we may well believe it faithfully describes the philosopher's manner of life and style of conversation. It was the moral and practical side of Socrates's teaching which most interested Xenophon; into his abstruse metaphysical speculations he seems to have made no attempt to enter; for these indeed he had neither taste nor genius. It was the philosophy which aims at "a sound mind in a sound body" which specially suited the robust and healthy mind of Xenophon. Moving within a limited range of ideas, he doubtless gives us "considerably less than the real Socrates, while Plato gives us something more."

Xenophon has left several minor works, some of which are very interesting and give us an insight into the home-life of the Greeks.

The *Œconomics*, which deals with the management of the house and of the farm, presents a pleasant and amusing picture of the Greek wife and of her home duties. She was to be thoroughly domestic, devoted to her household work, without any intellectual aspiration; she must keep up her good looks by healthy exercise, not by rouging or painting. There are some good practical remarks on matrimony and on the respective duties of husband and wife; in these it is assumed that providence has endowed each sex with capacities peculiar to itself and that the highest happiness is to be found in union and in well-organized co-operation. The true sphere of woman is in the faithful and diligent discharge of her home duties; this, above all things, will win her husband's respect and esteem.

In the essays on horsemanship (Ἱππική) and hunting (*Cynegeticus*), Xenophon deals with matters with which he had a thorough practical acquaintance. In the former he gives rules how to choose a horse, and then tells how it is to be groomed and ridden and generally managed. All this has still great interest for the modern reader. We gather from this little work that the ancient Greeks never used the stirrup, nor had they any idea of providing their horses with iron shoes. The book on hunting deals chiefly with the hare, though the author speaks also of boar-hunting and describes the hounds, tells how they are to be bred and trained, and gives specimens of suitable names for them. On all this he writes with the zest of an enthusiastic sportsman, and he observes that those nations will be most likely to be successful in war of which the upper classes have a taste for field-sports.

The *Hipparchicus* explains the duties of a cavalry officer; it is not, according to our ideas, a very scientific treatise, showing that the art of war was but very imperfectly developed and that the military operations of the Greeks were on a somewhat petty scale. He dwells at some length on the moral qualities which go to the making of a good cavalry officer, and hints very plainly that there must be strict attention to religious duties.

The *Agesilaus* is a eulogy of the Spartan king, who had two special merits in Xenophon's eyes: he was a rigid disciplinarian and he was particularly attentive to all religious observances. We have a summary of his virtues rather than a good and striking picture of the man himself.

The *Hiero* works out the line of thought indicated in the story of the Sword of Damocles. It is a protest against the notion that the "tyrant" is a man to be envied, as having more abundant means of happiness than a private person. This is one of the most pleasing of his minor works; it is cast into the form of a dialogue between Hiero, tyrant of Syracuse, and the lyric poet Simonides.

The *Symposium*, or "Banquet," is a brilliant little dialogue in which Socrates is the prominent figure. He is represented as "improving the occasion," which is that of a lively Athenian supper-party, at which there is much drinking, with flute-playing, and a dancing girl from Syracuse, who amuses the guests with the feats of a professional conjuror. Socrates's table-talk runs through a variety of topics, and winds up with a philosophical disquisition on the superiority of true heavenly love to its earthly or sensual counterfeit, and with an earnest exhortation to one of the party, who had just won a victory in the public games, to lead a noble life and do his duty to his country.

There are also two short essays on the political constitution of Sparta and Athens, written with a decided bias in favor of the former, which he praises without attempting to criticize. Sparta seems to have presented to Xenophon the best conceivable mixture of monarchy and aristocracy.

In the essay on the *Revenues of Athens*, he offers suggestions for making Athens less dependent on tribute received from its allies: first, more foreign settlers should be attracted to the city by holding out strong commercial inducements and from these a moderate capitation tax should be collected; secondly, more should be made of the silver mines of Laurium by leasing them out to private capitalists, who might work them by slaves purchased with public money and hired at a fixed rate by the lessees. But above all, he would have Athens use its influence for the maintenance of peace in the Greek world and for the settlement of questions by diplomacy, the temple at Delphi being for this purpose an independent centre and supplying a divine sanction.

The *Apology*, Socrates's defence before his judges, is rather a feeble production, and in the general opinion of modern critics not a genuine work of Xenophon.

The editions both of Xenophon's entire and of his separate works, especially of the *Anabasis*, are very numerous. A few of the best are enumerated below: (1) *Anabasis*, text of L. Dindorf, with notes by J. S. Watson, 1865; (2) *Memorabilia*, edited with short notes, by J. R. King, 1874 (Oxford); (3) *Hellenics*, text of C. G. Cobet, 1862; (4) *Cyropædia*, from the text of L. Dindorf, with notes by E. H. Barker, 1831. The minor works have been repeatedly edited. Useful editions of the *Hiero* (London, 1883) and *Œconomics* (London, 1884) have been issued by H. A. Holden. There is an English translation of the entire works by various hands, published in 1831; also a French translation, similarly executed, in 1845. To Sir A. Grant's monograph on Xenophon, in Blackwood's "Ancient Classics for English Readers," the present writer is considerably indebted. (W. J. B.)

and are of a nature to show the historical, geographical, and ethnological importance which is to be attached to the accounts handed down to posterity by that illustrious writer."

Y.

Y. The history of this symbol has already been given under U. The three symbols U, V, Y are only differentiations of one original form.

The sound of *y* in Greek was that of French *u* in "lune" and German *ü* in "übel." In Bœotian and Laconian Greek the old *u*-sound was retained; but it was represented by *ου*, a digraph which had also the value of *u* in other dialects where it arose from phonetic change, *e.g.*, in *τούς* (for *τόνς*). The name *ὐ ψιλόν* was probably given to distinguish it from *ὐ διὰ διφθόγγου*,—that is, the same sound, but denoted by *οι*, which in the 2d century B.C. was beginning to have the value of *υ*; just so *ἐ ψιλόν* is opposed to *αι*, or *ἐ διὰ διφθόγγου*. The difference in sound between the full and the modified *u* is this: for the first the lips are rounded as much as possible, and the back part of the tongue is raised towards the palate; for the second the rounding of the lips is the same, but the tongue is in the position for *i*, so that in sounding *ü* we are sounding *i* with the lips rounded in addition. This explains the ease with which the *i*-sound is produced instead of *ü* by persons unfamiliar with the latter sound: when an Englishman pronouncing "Müller," says "Miller," he puts the tongue right for *i* but omits to round the lips as well. This change has been a regular one in our language. There is no doubt that *y* (*i.e.*, *ü*) was a sound of Early English (or Anglo-Saxon), as of the other Teutonic languages, in words like "fȳr" (fire), "synn" (sin); it was the "umlaut" of *u*, especially when followed in the next syllable by *i* or *e*; so "burg" has for gen. and dat. "byrig," orig. "burges," "burge." But in Middle English *y* passed into *i:* thus "fȳr" (sounded as für) came to be sounded as "fīr" (feer), and this (as in other cases where ī occurs) was diphthongized in comparatively modern times into "fire" (faier). Thus in the middle of a word *y* lost its special value; on the other hand, at the beginning of a word it easily passed into the consonant *y*, the value which it has regularly in modern English. This explains the fact that the English language had no symbol for the sound of French *u* when this sound was reintroduced into England after the Norman Conquest. Accordingly the French symbol as well as the sound was taken: it is found in words like "muse," "lute," sounded as "myyz," "lyyte." The *yy* gradually developed into the *iu* sound with which we are familiar in "miūz," "liūt"; but the spelling remained unchanged. It must have been awkward to have the symbol *u* representing both the full (native) sound and the modified (French) sound; this was partially obviated by borrowing for the full *u*-sound the French writing *ou: e.g.*, "hūs" was written "house," without at first any change of sound; but this was not consistently carried out. Much later, at the end of the 16th century, the sound was diphthongized into "haus" (as now), but the spelling (*ou*) remained. The fact that *y* and *i* became indistinguishable led to the use of *y* at the end of a word instead of *i:* thus we write "day" instead of the older "dai."

In Early English we find the symbol ȝ (which is a modification of the Anglo-Saxon *g*) used initially with the value of *g*, and medially (chiefly before *t*) where modern English writes *gh*, as in *light*. This is due to French scribes, who used the French (*i.e.*, our modern) form of *g* for the *g*-sound, and then the ȝ for the sound which had been weakened in Anglo-Saxon from *g* to *y*, as in *ȝeard* (our *yard*) for original *gard* (Norse *garth;* in North English Aysgarth and Gatesgarth). About the 15th century this same symbol was mistaken for *z*, and as such it is still occasionally employed in cursive, when ȝ is written instead of *z*.

YACHOW-FU, a prefectural city in the Chinese province of Sze-ch'uen, is situated in 30° 4′ N. lat. and 103° 4′ E. long., and is a place of some antiquity and note, being first mentioned in history during the Chow dynasty (1122–255 B.C.). It is prettily placed in a valley surrounded by an amphitheatre of hills, on the banks of the river Ya. The town is large, populous, and busy, and owes its importance to the fact that it stands at the parting of the tea and tobacco trade route to Tibet *via* Tatsien-lu and the cotton trade route to western Yun-nan *via* Ningyuen-Fu. Yachow-Fu is the seat also of a considerable silk manufacture; and in its immediate neighborhood there exist both coal and iron. The city wall measures 2 miles in circumference, and is pierced by four gates. The population is estimated at about 40,000.

YACHTING is the sport of racing in yachts[1] and boats with sails for money or plate, and also the pastime of cruising for pleasure in sailing or steam vessels. The history of yachting is the history of yacht-racing, inasmuch as competition improved yachts just as horse-racing improved horses. It dates from the beginning of the 19th century; for, although there were sailing yachts long before, they were but few, and belonged exclusively to princes and other illustrious personages. For instance, in the Anglo-Saxon period Athelstan had presented to him by the king of Norway a magnificent royal vessel, the sails of which were purple and the head and deck wrought with gold, apparently a kind of state barge. Elizabeth had one, and so has every English sovereign since. During her reign a pleasure ship was built (1588) at Cowes, so that the association of that place with the sport goes back three hundred years. In 1660 Charles II. was presented by the Dutch with a yacht named the "Mary," until which time the word "yacht" was unknown in England. The Merrie Monarch was fond of sailing, for he designed a yacht of 25 tons called the "Jamie," built at Lambeth in 1662, as well as several others later on. In that year the "Jamie" was matched for £100 [$551.50] against a small Dutch yacht, under the duke of York, from Greenwich to Gravesend and back, and beat her, the king steering part of the time—apparently the first record of a yacht match and of an amateur helmsman.

The first authentic record of a sailing club is in 1720, when the Cork Harbor Water Club, now known as the Royal Cork Yacht Club, was established in Ireland, but the yachts were small. Maitland, in his *History of London* (1739), mentions sailing and rowing on the Thames as among the amusements then indulged in; and Strutt, in his *Sports and Pastimes* (1801), says that the Cumberland Society, consisting of gentlemen partial to this pastime, gave yearly a silver cup to be sailed for in the vicinity of London. The boats usually started from Blackfriars Bridge, went up the Thames to Putney, and returned to Vauxhall, being, no doubt, mere sailing boats and not yachts or decked vessels. From the middle to the end of the 18th century yachting developed very slowly: although matches were sailed at Cowes as far back as 1780, very few yachts of any size, say 35 tons, existed in 1800 there or elsewhere. In 1812 the Royal Yacht Squadron was established by fifty yacht-owners at Cowes and was called the Yacht Club, altered to the Royal Yacht Club in 1820; but no regular regatta was held there until some years later. The yachts of the time were built of heavy materials, like the revenue cutters, full in the fore body and fine aft; but it was soon discovered that their timbers and scantlings were unnecessarily strong, and they were made much lighter. It was also found that the single-masted cutter was more weatherly than the brigs and

[1] The English word yacht is the Dutch *jacht, jagt*, from *jachten*, "to hurry," "to hunt."

schooners of the time, and the former rig was adopted for racing, and, as there was no time allowance for difference of size, they were all built of considerable dimensions. Among the earliest of which there is any record were the "Pearl," 95 tons, built by Sainty at Wivenhoe near Colchester in 1820, for the marquis of Anglesey, and the "Arrow," 84 tons, originally 61 feet 9½ inches long and 18 feet 5¼ inches beam, built by Joseph Weld in 1822, which is still extant as a racing yacht, having been rebuilt and altered several times, and again entirely rebuilt in 1887–88. The Thames soon followed the example of the Solent and established the Royal Thames Yacht Club in 1823, the Clyde founding the Royal Northern Yacht Club in 1824, and Plymouth the Royal Western in 1827. In this year the Royal Yacht Squadron passed a resolution disqualifying any member who should apply steam to his yacht,—the enactment being aimed at T. Assheton Smith, an enthusiastic yachtsman and fox-hunter, who was having a paddle-wheel steam yacht called the "Menai" built on the Clyde. In 1830 one of the largest cutters ever constructed was launched, viz., the "Alarm," built by Inman at Lymington for Joseph Weld of Lulworth Castle, from the lines of a famous smuggler captured off the Isle of Wight. She was 82 feet on the load line by 24 feet beam, and was reckoned of 193 tons, old measurement, in which length, breadth, and half-breadth (supposed to represent depth) were the factors for computation. Some yachtsmen at this time preferred still larger vessels and owned square-topsail schooners and brigs like the man-o'-war brigs of the day, such as the "Waterwitch," 381 tons, built by White of Cowes, in 1832, for Lord Belfast, and the "Brilliant," barque, 493 tons, belonging to J. Holland Ackers, who invented a scale of time allowance for competitive sailing. In 1834 the first royal cup was given by William IV. to the Royal Yacht Squadron—a gift which has been continued ever since (except in 1862, when it was dropped for one year, owing to the death of the Prince Consort), and in recent years supplemented by similar gifts to other clubs. In 1836 the Royal Eastern Yacht Club was founded at Granton near Edinburgh; in 1838 the Royal St. George's at Kingstown and the Royal London; in 1843 the Royal Southern at Southampton and the Royal Harwich; in 1844 the Royal Mersey at Liverpool and the Royal Victoria at Ryde. The number of vessels kept pace with the clubs—the fifty yachts of 1812 increasing nearly tenfold before the middle of the century, which was the critical epoch of yacht-building.

In 1848, after J. Scott Russell had repeatedly drawn attention to the unwisdom of constructing sailing vessels on the "cod's head and mackerel tail" plan, and had enunciated his wave-line theory, Mare built at Blackwall an entirely new type of vessel, with a long hollow bow and a short after body of considerable fulness. This was the iron cutter "Mosquito," of 59 feet 2 inches water line, 15 feet 3 inches beam, and measuring 50 tons. Prejudice against the new type of yacht being as strong as against the introduction of steam, there were no vessels built like the "Mosquito," with the exception of the "Volante," 59 tons, by Harvey of Wivenhoe, until the eyes of English yachtsmen were opened by the Americans three years later. About this period yacht-racing had been gradually coming into favor in the United States, the first yacht club being founded at New York in 1844 by nine yacht-owners; and in 1846 the first match between yachts in the States was sailed, 25 miles to windward and back from Sandy Hook lightship, between J. C. Stevens's new centre-board sloop "Maria," 170 tons, 100 feet water line and 26 feet 8 inches beam, with a draught of 5 feet 3 inches of water, and the "Coquette," schooner, 74 tons, belonging to J. H. Perkins, the latter winning; but the appearance of the "Maria," which had a clipper or schooner bow, like that of the newest racing cutters of 1887–1888, did much for yachting in America. Stevens then commissioned George Steers of New York, builder of the crack pilot schooners, to construct a racing schooner to visit England in the year of the great exhibition, and the result was the "America" of 170 tons. Like the "Mosquito," she had a very long and hollow bow, with considerable fulness aft. She crossed the Atlantic in the summer of 1851, but failed to compete for the queen's cup at Cowes in August, although the club for that occasion threw the prize open to all the world, as her owner declined to concede the usual time allowance for difference of size. The members of the Yacht Squadron, not wishing to risk the reproach of denying the stranger a fair race, decided that their match for a cup given by the club, to be sailed round the Isle of Wight later on in the same month, should be without any time allowance. The "America," thus exceptionally treated, entered and competed against fifteen other vessels. The three most dangerous competitors being put out through accidents, the "America" passed the winning post 18 minutes ahead of the 47 ton cutter "Aurora," and won the cup; but, even if the time allowance had not been waived, the American schooner yacht would still have won by fully a couple of minutes.

The prize was given to the New York Yacht Club and constituted a challenge cup, called the America cup, for the yachts of all nations, by the deed of gift of the owners of the winner. Not only was the "America" as great a departure from the conventional British type of yacht as the "Mosquito," but the set of her sails was a decided novelty. In England it had been the practice to make them baggy, whereas those of the "America" were flat, which told materially in working to windward. The revolution in yacht designing and canvassing was complete, and the bows of existing cutters were lengthened, that of the "Arrow" among others. The "Alarm" was also lengthened and turned into a schooner of 248 tons, and the "Wildfire," cutter, 59 tons, was likewise converted. Indeed there was a complete craze for schooners, the "Flying Cloud," "Gloriana," "Lalla Rookh," "Albertine," "Aline," "Egeria," "Pantomime," and others being built between 1852 and 1865, during which period the centre board, or sliding keel, was applied to schooners as well as sloops in America. The national or cutter rig was nevertheless not neglected in England, for Hatcher of Southampton built the 35-ton cutter "Glance"—the pioneer of the subsequent 40-tonners—in 1855, and the "Vampire"—the pioneer of the 20-tonners—in 1857, in which year Weld also had the "Lulworth," an 82-ton cutter of comparatively shallow draught, constructed at Lymington. At this time, too, there came into existence a group of cutters, called "flying fifties" from their tonnage, taking after the "Mosquito" as their pioneer; such were the "Extravaganza," "Audax," and "Vanguard." In 1866 a large cutter was constructed on the Clyde called the "Condor," 135 tons, followed by the still larger "Oimara," 163 tons, in 1867. In 1868 the "Cambria," schooner was built by Ratsey at Cowes for Ashbury of Brighton, and, having proved a successful match-sailer, was taken to the United States in 1870 to compete for the America cup, but was badly beaten, as also was the "Livonia" in 1871.

The decade between 1870 and 1880 may be termed the Golden Age of yachting, inasmuch as the racing fleet had some very notable additions made to it, of which it will suffice to mention the schooners "Gwendolin," "Cetonia," "Corinne," "Miranda," and "Waterwitch," the large cutters "Kriemhilda," "Vol au Vent," "Formosa," "Samæna," and "Vanduara;" the 40-tonners "Foxhound," "Myosotis," and "Norman;" the 20-tonners "Vanessa" (Hatcher's masterpiece), "Quickstep," "Enriqueta," "Louise," and "Freda;" and the yawls "Florinda," "Corisande," "Jullanar," and "Latona." Lead, the use of which commenced in 1846, was entirely used for ballast after

1870 and placed on the keel outside. Of races there was a plethora; indeed no less than 400 matches took place in 1876, as against 63 matches in 1856, with classes for schooners and yawls, for large cutters, for 40-tonners, 20-tonners, and 10-tonners. The sport too was better regulated, and was conducted on a uniform system; the Yacht-Racing Association, established in 1875, drew up a simple code of laws for the regulation of yacht races, which was accepted by the yacht clubs generally, though a previous attempt to introduce uniformity, made by the Royal Victoria Yacht Club in 1868, had failed. The Association adopted the rule for ascertaining the size or tonnage of yachts which had been for many years in force, known as the Thames rule; but in 1879 they altered the plan of reckoning length from that taken on deck to that taken at the load water line, and two years later they adopted an entirely new system of calculation. Subsequently to these repeated changes yacht-racing gradually waned, the new measurement exercising a prejudicial effect on the sport, as it enabled vessels of extreme length, depth, and narrowness, kept upright by enormous masses of lead on the outside of the keel, to compete on equal terms with vessels of greater width and less depth, in other words, smaller yachts carrying an inferior area of sail. Of this type are the yawls "Lorna," and "Wendur," the cutters "May," "Annasona," "Sleuth-hound," "Tara," and "Marjorie,"—the most extreme of all being perhaps the 40-tonner "Tara," which is six times as long as she is broad, and unusually deep, with a displacement of 75 tons, 38 tons of lead on her keel, and the sail spread of a 60-tonner like "Neva."

In 1884 two large 80-ton cutters of the above type were built for racing, viz., the "Genesta" on the Clyde and the "Irex" at Southampton. Having been successful in her first season, the former went to the United States in 1885 in quest of the America cup; but she was beaten by a new yacht, called the "Puritan," built for the purpose of defending it, with a moderate draught of 8 feet 3 inches of water, considerable beam, and a deep centre-board. The defeat of the "Genesta" is not surprising when it is recollected that she drew 13 feet of water, had a displacement or weight of 141, as against the "Puritan's" 106 tons, and a sail area of 7887 square feet to the American's 7982,—a greater mass with less driving power; but she did not leave the States empty-handed, as she won and brought back the Cape May and Brenton Reef challenge cups, though they were wrested from her by the "Irex" in the following year. The same thing happened to the "Galatea," which was beaten by the "Mayflower" in 1886. In 1887 a new cutter, called the "Thistle," was built on the Clyde to try to win back the America cup; but, although built very differently from the "Genesta" and "Galatea," *i.e.*, of a much greater width than modern English racing yachts generally, the "Thistle," when matched with the new centre-board "Volunteer," had no better fortune than her predecessors. These new American racing vessels are something very different from the old flat-bottomed sloop "Maria," with one head-sail and a trivial draught of water, inasmuch as they are lead-ballasted cutters with two head-sails and a draught of nearly 10 feet of water, with the additional advantage of a centre-board descending as much as 8 or 10 feet below the keel. In this connection it is noteworthy that a prize won by a fixed-keel schooner should be defended by centre-board craft with a single mast.

From 1887 an entirely new system of measurement for competitive sailing has been adopted in the United Kingdom, the old plan of measuring the hull having given way to the more rational one of taking the length on the water-line and the sail area of the vessel as the factors for rating. This leaves naval architects free to adopt a long and narrow or a short and "beamy" hull.

Yacht-racing as at present conducted is simple and easily managed. A course is chosen by the committee of the club giving the prizes, averaging for first-class vessels 40 or 50 nautical miles in length, such as the old queen's course from Cowes eastward to the Nab lightship, back past Cowes to Lymington, and returning to the starting-post. The competitors, *i.e.*, cutters, yawls, and schooners,—cutters sailing at their full, yawls at four-fifths, and schooners at three-fourths of their tonnage or rating—cruise about under way in readiness for crossing an imaginary line between the club-house or committee vessel and a mark-boat, which forms the starting as well as winning place, on the signal being given. No time is allowed at the start, but only at the finish, and consequently there is a good deal of manœuvring to get across the line first and to windward. The yachts make the best of their way onwards, running if the wind is abaft them, reaching if it is on the beam, and close-hauled if it is foul, the greatest skill being shown in cross-tacking and getting the weather-gauge. When close-hauled and reaching, the ordinary fore-and-aft sail (see SAIL, SEAMANSHIP, and SHIPBUILDING) is used; but when going free a large racing sail called a spinnaker is set on a long boom projecting from the foot of the mast at right angles to the vessel. This sail, which is a triangular one, extends from the topmasthead to the deck, on the opposite side to that occupied by the main boom, though occasionally shifted to the bowsprit end. After leaving all the marks on the port or starboard hand, as may be directed in their instructions, the competing yachts arrive at the winning-place generally in single file, the moment at which each competitor passes the line being noted by a time-keeper. It is then ascertained whether any and which vessel has saved her time allowance, which varies according to the length of the course, and the first which has done so is declared to have won. The amount of prize money gained by the most successful vessel of the season—almost always a cutter—generally exceeds 1000 sovereigns [$5103], exclusive of cups or plate. The expense of racing is enormous; in the case of an 80 or 100-ton cutter it amounts to fully £2000 [$9720] or £3000 [$14,580] a year. The cost of cruising is of course not so great, the wages of non-racing crews (which are much smaller in number) being less, and averages perhaps £10 [$48.60] a ton. There are not such frequent renewals of sails; there are not so many breakages of spars, no entrance fees, and no "winning money" to pay the crew, nor any of the thousand and one extras which go to swell the yearly account of the racing owner. Racing yachts make good cruisers if their spars are shortened and their wings clipped; and it is a very common practice to turn an ex-racing cutter into a yawl, by shortening her boom and adding a mizzen-mast and mizzen-sail to her counter. The yawl rig is comfortable for cruising, but not so successful for racing as the cutter. The speed of yachts varies according to their length, and this is one reason why an allowance in time should be given by a large yacht to a smaller one. As instances of pace it is on record that the "Arrow" in 1858 sailed 45 knots in 4 h. 19 m., and 50 knots in 1872 in 4 h. 40 m. In the latter year the "Kriemhilda" did 50 knots in 4 h. 37 m., while the "Marjorie" did the same distance in 4 h. 26 m., and the "Samæna" in 4 h. 15 m. in 1883; the "Lorna" (yawl) in 4 h. 14 m., and the "Irex" in 4 h. 7 m., both in 1885,—all these distances being sailed inside the Isle of Wight, irrespective of the state of the tide. A greater pace has been developed by schooners in bursts of speed with a fair tide and half a gale of wind behind them, but in racing inside the Isle of Wight the "Egeria" in 1870 did 50 knots in 4 h. 27 m., the "Olga" in 4 h. 25 m. in 1875, the "Enchantress" in 4 h. 18 m. in 1879, which is not so quick as the cutters.

As to the number of yachts now afloat, cruisers as well as racers, the British yacht fleet, which in 1850 consisted of 500 sailing and 3 steam vessels, now numbers 2209 sailing yachts, of 64,051 tons, and 700 screw steam yachts, of 68,667 tons, or a gross total of 2909 yachts, of 132,718 tons—in round numbers 3000 yachts, allowing for small craft not included in the above total. They are constructed of wood, iron, or steel—this last gradually coming to the front in the pleasure fleet as well as in the mercantile marine and royal navy. Next to Great Britain the United States possesses the largest number afloat, amounting to nearly if not quite 1200 yachts; and, if to the foregoing are added the yachts of other countries included in Lloyd's list, a grand total of upwards of 5000 is reached. While the taste for sailing vessels has made marked strides since 1850, that for steam yachts has made still more extraordinary progress, one noteworthy feature being the increase in their size, and another their enormous prime cost. More than thirty of those recently built exceed 500 tons, while double that number range from 300 to 500 tons; two or three even exceed 1000 tons each.

Admiralty warrants are granted to clubs and their mem-

bers to fly the white, blue, or red ensign with device on it, such yachts being registered according to the provisions of the Merchant Shipping Acts. The white man-of-war or St. George's ensign, used by British war-ships, is flown by the Royal Yacht Squadron alone of yacht clubs. The ordinary red ensign of the merchant navy may be flown by any English vessel without permission of Government, as it is the national flag. Yachts with Admiralty warrants are entitled to certain privileges, such as exemption from excise and some other dues; they may enter Government harbors without paying dues, and may make fast and lie to Government buoys when these are not required by any of H. M. ships; they need not have their names painted on their sterns, though it is better that they should; and their masters need not hold Board of Trade certificates.

YAK. This animal is the *Bos grunniens* of Linnæus and all subsequent zoologists, so-called on account of the pig-like grunting sounds it makes. It is structurally more closely allied to the common ox than to the bison, with which group of the *Bovidæ* it has been sometimes erroneously associated. It is only found in the lofty plateau of Asia between the Altai Mountains and the Himalayas, and occurs both wild and as the ordinary domestic animal of the inhabitants of that region, supplying milk, food, and raiment, as well as being used as a beast of burden. The wild yaks inhabit the most inaccessible parts of the mountains, ranging up to an elevation of 20,000 feet,—higher, it is said, than any other animal,—delighting in extreme cold, and finding their sustenance in the coarse, wiry grass which is almost the only vegetable production of those desolate regions. They cannot live to the south of the Himalayas beyond the immediate neighborhood of the snow. Their size is that of a small ox. The

Yak.

horns are long, nearly cylindrical, smooth, and pointed at the ends, and with a peculiar and characteristic curve, being directed at first outwards, then upwards, forwards, and inwards, and finally a little backwards. Some of the domestic yaks are hornless. The most remarkable external character is the excessive growth and peculiar distribution of the hairy covering. The upper parts of the body and sides are clothed with a thick, soft, woolly hair, more fully developed along the middle of the back, especially on the shoulders, where it forms a great bunch; on the sides it is comparatively short. From the upper parts of the limbs and the whole of the lower surface of the body a thick growth of long, straight pendent hair descends, in old animals sweeping the ground and almost concealing the somewhat short legs. The tail is profusely covered with a thick mass of such hairs. The calves are at first covered only with a soft, shortish woolly hair, of nearly uniform length all over. Domestic yaks vary considerably in size and appearance according to their treatment and the purpose for which they are bred. The finest are those used for carrying the native chiefs. Those employed for ploughing are very inferior-looking animals. They vary also in color. The wild animals are nearly uniformly black; the domestic yaks are often quite white. It is not uncommon to see the long hair on the ridge of the back, that on the tail, and the long flowing hair of the under parts white, whilst all the rest of the animal is black. The tails of the domestic yaks are used as ornamental standards by the Tartars, and are largely imported into India as chowries or fly-flaps.

YAKUTSK, a province of Eastern Siberia, which includes nearly the whole of the basin of the Lena, and covers an area of 1,517,127 square miles (nearly one-third of Siberia and almost one-fifth of the entire Russian empire). It has the Arctic Ocean on the N., Yeniseisk on the W., Irkutsk, Transbaikalia, and Amur on the S., and is separated from the Pacific (Sea of Okhotsk) only by the narrow Maritime Province (see vol. xxii. pl. I.).

Physical features.

The Vitim plateau, from 2500 to 3500 feet in altitude, and bordered on the southeast by the Stanovoi Mountains, occupies the southeastern portion of the province. Its moist elevated valleys, intersected by ranges of flat, dome-shaped hills, which rise nearly 1000 feet above the plateau, are unsuited for agriculture, and form an immense desert of forest and marsh, visited only by Tungus hunters, save in the southwest, where a few settlements of gold miners have lately sprung up. The high border-ridge of the plateau (see SIBERIA) stretches from the South Muya Mountains towards the northeast, thus compelling the river Aldan to make its great bend in that direction. The ridge is almost entirely unknown, having been crossed by only two geographers at points more than 500 miles apart. The alpine country fringing the plateau all along its northwestern border is better known in the southwest, where rich gold-mines are wrought in the spurs between the Vitim and the Lena; and farther northeast it has been crossed by several geographers (Middendorff, Erman, the Siberian expedition) on their way from Yakutsk to the Sea of Okhotsk. The Lena, in that part of its course where it flows northeast, waters the outer base of this alpine region. It is a wild land, traversed by several chains of mountains, all having a northeastern direction and intersected by deep, narrow valleys, where wild mountain streams flow amidst immense boulders and steep cliffs. The whole is covered with dense forests, through which none but the Tunguses can find their way, and they only by means of marks made on the trees. The summits of the mountains, ranging from 4000 to 6000 feet, mostly rise above the limits of tree vegetation, but in no case pass the snow-line. Summits and slopes alike are strewn with crystalline rock débris, mostly hidden under thick layers of lichens, where only the larch, which sends out its roots horizontally, can find support and sustenance. Birch and aspen grow on the lower slopes; and where strips of alluvium have been deposited in the narrow bottoms of the valleys thickets of poplar and willow make their appearance, or a few patches of grassy soil are occasionally found. These last, however, are so rare that all of them are known to the gold-diggers for scores of miles around their settlements, and hay has to be brought at considerable cost from the lowlands. All necessaries of life for the gold-diggings have to be shipped from Irkutsk down the Lena, and deposited at entrepôts, whence they are transported in winter by means of reindeer to their destination. A line drawn southwest and northeast, from the mouth of the Vitim towards that of the Aldan, separates the mountain

tracts from the elevated plains (from 1500 to 2000 feet) which fringe the highlands all the way from the upper Lena to Verkhne-Kolymsk, and probably to the mouth of the Kolyma. Immense and sometimes marshy meadows extend over those plains in the southwest; farther north mosses and lichens are the prevalent vegetation. The surface is much furrowed by rivers and diversified by several mountain-chains (Verkhoyansk, Taskaryktakh, Kolymsk, and Alazeya.) Little is known as to the real character of these mountains, although they are figured on maps as isolated ridges shooting northwest from the highlands, between the chief rivers which flow into the Arctic Ocean. Beyond the elevated plains vast tundras, covered with mosses and lichens, stretch to the shores of the ice-bound ocean; only a few trees succeed in the struggle for a miserable existence, though some isolated groups penetrate farther north along the courses of the Lena, the Indighirka, and the Kolyma, almost reaching in the first-named valley the seventy-second degree of north latitude.

Northern coast.

The Arctic coast is indented by several bays—Borkhaya and Yana to the east of the wide Lena delta, and Omulyakh, Kolyma, and Tchaunskaya still farther to the east. Islands have been explored as far as 78° N. lat. These fall into three groups,—the Lyakhovskiye, the Anjou or New Siberian, and the De Long Islands. The Medvyezhie (Bear) Islands off the Kolyma and the two Ayun Islands in Tchaunskaya Bay are merely littoral. Wrangel's Land seems to be the outer island of a great and as yet unknown archipelago. The entire coast of Yakutsk is full of memorials of the courageous explorations made in 1735–41 by Minin, Lapteff, and Prontchischeff in small boats, without any of the modern appliances for Arctic explorations, and Tchaunskaya Bay recalls the loss of Shalauroff's expedition. The prospects of regular navigation recently raised by Nordenskjöld's bold circumnavigation of Asia seem unlikely to be fully realized, the ice apparently having never again been in so favorable a condition as in 1878–79. Every year, however, a narrow passage close by the coast is left almost free of ice, enabling a ship or two to reach the estuary of the Yenisei, or even the delta of the Lena.

Rivers.

The great artery of Yakutsk, the Lena, rises on the western slope of the Baikal Mountains, its sources being separated only by a narrow ridge from the great Siberian lake. It soon issues from the mountain valleys, and flows over the elevated plains, where it has carved a deep channel between horizontal layers of Old Red Sandstone and further on of contorted beds of limestone. As far as Yakutsk it maintains its north-eastern direction, with but one great bend in 60° N. lat. and several small windings in its upper course. At Katchug—a lading-place 180 miles northeast from Irkutsk—it is still shallow, but soon becomes a mighty stream of much beauty, which is increased by the high crags and mountains amidst which it has dug its channel. Though thus picturesque, its valley can hardly be called hospitable; the narrow level stretches along the base of the mountains are often marshy, while the raw and wet climate renders agriculture most difficult; the villages are poverty-stricken, and in most of them goitre is endemic. About 60° N. Lat. the Lena receives from the right its first great tributary, the Vitim (1400 miles in length), which after a very sinuous course leaves the great plateau below Lake Oron, by a narrow gorge which has not yet been visited by any geographer. It is navigable by steamers in its lower course. The next large tributary of the Lena is the Olekma (about 800 miles), which also rises on the plateau and crosses it from south to north; it is navigable only in the very lowest part of its course; higher up, its valley, which offers the greatest difficulties for the traveller, has been utilized as a route only by the Cossack conquerors of Siberia and by one of the members of the Siberian expedition. The next important tributary, also from the right, is the Aldan (nearly 1300 miles), which first flows parallel to the Lena and then turns northwestwards to join it, itself receiving on the left a large tributary, the Amga. It is navigated from Ust-Maya. The only large tributary of the Lena on the left is the Vilui (about 1300 miles), which has an immense drainage-area on the lower plains, and since 1887 has been navigated by a steamer. At Yakutsk the Lena becomes a magnificent stream of more than 4 miles in width, with numerous islands, and this character it maintains for the next 1200 miles of its course, sometimes reaching a width of 17 miles and a depth of 7 to 8 fathoms. It enters the Arctic Ocean by a wide delta, occupying more than 250 miles of the coast-line; here the river divides into seven or eight principal branches, the chief of which vary from 35 to 65 miles in length, the largest being more than 6 miles broad. The bar, however, has only 8 feet of water, and the Swedish steamer "Lena" had great difficulty in entering from the sea. The lower course of the river is subject to terrible inundations when the ice breaks up on its upper part, whilst at the same time the higher reaches of its lower course are still covered with ice several feet in thickness. Large portions of the banks are then torn away by the enormous masses of ice. The Olenek (1200 miles), which enters the Arctic Ocean to the west of the Lena, is also a considerable river; the Yana (1000 miles), Indighirka (950), and Kolyma (1000) to the east all rise in the mountain region between 61° and 62° N. lat. and flow north and northeast into the Arctic Ocean.

Geology and minerals.

The granites, granitic syenites, and gneisses of the high plateau are surrounded by a variety of crystalline slates, Huronian and Laurentian; and vast layers of Silurian and Devonian limestones and sandstones extend over large areas. Farther north the Carboniferous, Chalk, and Jurassic formations are spread over a wide region, and the whole is covered with layers of Glacial deposits in the highlands and of post-Glacial elsewhere. The mineral wealth of Yakutsk is very great; but gold (262,200 oz. in 1884) and salt (obtained from springs to the amount of about 6000 cwts. annually) only are worked. Coal has been recently discovered on the Vilui close by its mouth, as also on the lower Lena.

Climate.

Though there are spots in the North-American archipelago and in northern Greenland where the cold is as intense as at Yakutsk, no region can be named which has such extremes of cold and heat or winter temperatures so low, so long continued, or spread over so immense an area. Verkhoyansk on the Yana (67° 34′ N. lat. and 134° 20′ E. long.) is, in respect of cold, the pole of the Old World; nowhere, even in Siberia, do we find such low winter temperatures; from whatever quarter the wind may blow it cannot fail to bring a warmer temperature to Verkhoyansk. Frosts of — 76° Fahr. have been observed there, and the average temperature of the three winter months is — 53.1°; even that of March is but little above the freezing-point of mercury (— 37.9°). Neither Ust-Yansk (70° 55′ N. lat., but close to the sea coast), nor Yakutsk, nor even the polar station of Sagastyr at the mouth of the Lena (73° 23′ N. lat.) has a winter so cold and so protracted. And yet at Sagastyr temperatures of — 63.6° were measured in February, 1883, and the average temperature of that month was only — 43.6°. At Yakutsk the average temperature of the winter is — 40.2°, and the soil is frozen to a depth of 600 feet (Middendorff). Even at a depth of 382 feet the temperature of the soil is 26.4° Fahr. For further particulars, see SIBERIA, vol. xxii. p. 10. The Lena, both at Kirensk and at Yakutsk, is free from ice for only 161 days in the year, the Yana at Ust-Yansk for 105. While at Yakutsk only 145 days and at Verkhoyansk only 73 have no snow; the interval between the latest frosts of one season and the earliest frosts of the next is barely 37 days, and even less in the north.

Population.

In spite of the rigors of its climate, the province of Yakutsk had 243,450 inhabitants in 1883, and the population is supposed to be increasing notwithstanding the infectious diseases which sometimes sweep away whole villages. The Russians constitute but a trifling element in the population; and their villages, numbering scarcely twenty, are chiefly peopled by exiled Nonconformists, belonging to the sects reputed "dangerous." In 1879 there were 5400 exiles living in the towns or settled in the Yakut encampments, 5300 peasants (also formerly exiles), 1890 military, and 4100 artisans, merchants, and officials. The remainder were chiefly Yakuts (211,900), and partly Tunguses (10,400), with a few Yukaghirs, Lamuts, and Tchuktchis. The Yakuts belong to the Turkish stem (see vol. xxiii. p. 702), and speak a dialect of Turkish, with an admixture of Mongolian words. They call themselves Sokha (pl. Sokhalar), their present name having been borrowed by the Russians from the Tunguses, who call them Yeko or Yekot. Most probably they formerly inhabited southern Siberia, and especially the upper Yenisei, where a Tartar stem calling itself Sakha still remains in Minusinsk. They are middle-sized, have dark and rather narrow eyes, a broad flat nose, thick black hair, and almost no beard. On the whole they are healthy and reach an advanced age, are very laborious and enterprising, and display in schools much more intelligence than the Tunguses or Buriats. Their implements show a great degree of skill

and some artistic taste. They live in log *yurtas* with small windows, into which plates of ice or pieces of skin are inserted instead of glass. A large fire is kept continually burning in the middle of the yurta, which always has a wooden chimney. The yurtas are usually at some distance from one another, but at the same time are grouped into villages or *naslegs*. During summer they abandon their wooden dwellings and encamp in conical tents, consisting of a few poles covered with prepared birch bark. Their food is chiefly flesh, and their drink koumiss. Though nearly all are nominally Christians, they retain much of their original Shamanism. Their settlements, which formerly were limited to the valleys of the Lena and its northern tributaries, are now steadily advancing southwards into the hunting domains of the Tunguses, who give way before the superior civilization of the Yakuts. Wherever they penetrate, even in the valleys at the base of the Vitim plateau (Muya, Tchara), they always cultivate some barley, and carry on some trade.[1]

Occupations.

Both the Russians and the Yakuts carry on some agriculture wherever possible in the southern parts of the province; it was estimated in 1879 that 40,000 quarters of barley, summer rye, wheat, and oats were cropped in Yakutsk (23,000 quarters by the Yakuts). But cattle-breeding is the chief means of support; in 1879 there were in Yakutsk 130,400 horses of an excellent small, but most hardy breed, 260,900 cattle, 49,000 reindeer, and several thousands of dogs, which are used for travelling purposes. The hunting of the wild reindeer affords the chief means of subsistence in the tundras; wealth or famine depends upon its success or failure. The herds are attacked on the routes they pursue during their migrations, especially where they have to cross a river. Farther north the pursuit of water-birds, which come in innumerable flocks to breed on the lakes of the tundras and the shores of the ocean, is a most important resource. Fishing also is carried on even in winter from beneath the ice. The mountains between the Lena and the Vitim have, during the last thirty years, become a most important centre of gold-washings, and, notwithstanding the difficulties of communication, and the necessity of bringing everything from Irkutsk or Transbaikalia, the population of the gold-mines of the Olekma and Vitim numbered more than 13,000 in 1882. Thousands of workmen go every spring down the Lena to work at the mines and return to their villages in autumn.

Communication and trade.

The principal channel of communication in Yakutsk is the Lena. As soon as the spring arrives, scores of boats are built at Katchug, Verkholensk, and Ust-Ilga, and the goods brought on sledges in winter from the capital of Eastern Siberia, including considerable amounts of corn and salt meat, are shipped down the river. Steamers ply all along its course, and enter its tributary, the Vitim, which is navigated almost to the gorges beneath Lake Oron. A few steamers descend to the delta of the Lena, and return with cargoes of fish and furs. There are very few overland routes. A new one, available for the transport of live stock from Transbaikalia to the gold-mines of Olekma, was opened in 1869, and cattle are brought every year from Transbaikalia, notwithstanding the hardships of the 700 miles' route across the plateau and the wild mountain tracts. Two other routes, also mere footpaths, on which travellers and goods are transported on horseback, radiate from Yakutsk to Ayan and to Okhotsk. Manufactured goods and groceries, chiefly tea, rice, and sugar, were imported to Yakutsk by the former route to the amount of some 1000 cwts. in 1883; these goods cross the Stanovoi Mountains and the plateau on sledges as far as the Maya, whence they are shipped to Yakutsk.

The province is divided into five districts, the chief towns of which are—YAKUTSK (see below), Sredne-Kolymsk (560), Olekminsk (500), Verkhoyansk (290), and Viluisk (390). Except Yakutsk, these "towns" are but miserable villages. (P. A. K.)

YAKUTSK, capital of the above province, situated in 62° 2′ N. lat. and 129° 44′ E. long., 1800 miles to the northeast of Irkutsk, was founded by Cossacks in 1622. It stands on a branch of the Lena, Khatystakh, between which and the main river, five miles distant, lie several low islands. During the break-up of the ice the water of the Khatystakh, finding no outlet into the Lena on account of the huge masses of ice, rises and floods the lower parts of the town, leaving after its subsidence great pools, which, as well as Lake Taloye close by, become a source of infectious disease. The town is, however, protected to some extent by a wooden embankment. The old fort is now destroyed, but its five wooden towers, erected in the 17th century, are still standing. The streets are unpaved, and the wooden houses are built upon high basements to protect them from the inundations. The shops only are of stone. There are in Yakutsk a cathedral, three churches, a monastery, two gymnasia for boys and girls, and several elementary schools. It is the residence of the Russian governor and the provincial authorities, as well as of a few wealthy merchants, who carry on trade in furs, mammoth bone, and reindeer hides, which are exported to Russia, and in imported groceries and manufactured goods. The arrival of the latter gives occasion to a fair in July, which is frequented by natives from all parts of the province; the returns are estimated at about £450,000 [$2,187,000]. The population was 5290 in 1885.

YAM, a term usually applied to the tubers of various species of *Dioscorea*. These are plants with thick root-stocks, from which protrude long slender, climbing stems, bearing alternate or opposite, entire or lobed leaves and unisexual flowers in long clusters. The flowers are generally small and individually inconspicuous, though collectively showy. Each consists of a greenish bell-shaped or flat perianth of six pieces, enclosing six or fewer stamens in the case of the male flowers, and a three-celled, three-winged ovary in that of the female flowers. The ovary ripens into a membranous capsule, bursting by three valves to liberate numerous flattish or globose seeds. The species are natives of the warmer regions of both hemispheres, and many of them are important on account of the large amount of starch contained in their tubers. According to Prof. Church's analysis of the Chinese yam, it contains more nutritive or nitrogenous matter, but less starch, than potatoes: in 100 parts there are of water 82.6, starch 13.1, albumen 2.4, fat 0.2, woody fibre 0.4, and mineral matter 1.3 parts.

D. sativa and *D. alata* are the species most widely diffused in tropical and sub-tropical countries. *D. aculeata*, grown in India, Cochin China, and the South Sea Islands, is esteemed one of the best varieties. *D. japonica*, the Chinese yam, is hardy in Great Britain, but the great depth to which its enormous tubers descend renders its cultivation unprofitable; the tubers of *D. alata* sometimes attain a weight of 100 lb. Most of the yams contain an acrid principle, which is dissipated in cooking.

The only European *Dioscorea* is that known as *D. pyrenaica*, found in 1845 in the Pyrenees, a remarkable instance of a species growing at a long distance from all its congeners. True yams must not be confounded with the sweet potato, *Convolvulus Batatas* (see vol. xix. p. 615), as they sometimes are in London markets. The common black briony (*Tamus communis*) of hedges in England is closely allied to the yams of the tropics, and has a similar root-stock, which is reputed to be poisonous.

YAMBO, or YEMBO, more properly YANBO', a town of Arabia on the Red Sea, in 24° 4′ N. lat. Having the best harbor on this coast, it has taken the place of Al Jâr (which lay to the south and is now ruined) as the port of Medina, and is visited by steamships in connection with the pilgrim traffic and for the import of grain. The town is surrounded by dilapidated walls, and the fixed population probably does not exceed 4000 (Von Maltzan). The Johaina Arabs are the dominant element, though there is a Turkish officer and guard who maintain a certain authority within the walls. Six or seven hours' journey inland at the base of the mountains (Jebel Raḍwâ) is the fruitful valley of Yanbo' al-Nakhl, with palm-groves, several hamlets of the Johaina, and country houses of the merchants of the port. This inland town, or group of villages, is the Yanbo' of the old Arab geographers, and lies on the route of the Egyptian pilgrim caravan, one night's journey from the famous battle-

[1] Besides the older literature, the bibliography of which is given in Semenoff's *Geogr. Dictionary* (Russian), compare Radloff's *Aus Sibirien* (Leipsic, 1884); F. Müller's *Tungusen und Yakuten* (Leipsic, 1882); and Vambéry's *Das Türkenvolk* (Leipsic, 1885); and several interesting monographs in *Izvestia* of East Siberian Geogr. Soc.

field of Bedr. The port is sometimes distinguished as Yanbo' al-Bahr (Yanbo' on the Sea).

YANAON, a French settlement in India, near the mouth of the Godavari on the Coromandel coast, in the Godavari district, Madras presidency. It is situated in 16° 44′ 10″ N. lat. and 82° 12′ 5″ E. long., and has an area of 2258 acres and a population of 4473.[1]

Yanaon was founded shortly before 1750, and its fortunes followed the vicissitudes of French history in southern India. With the other French possessions in India it was secured by the treaty of 1814–15.

YANG-CHOW FU, or Hang-Chow Foo, a prefectural city in the Chinese province of Kiang-su, is situated on the Grand Canal in 32° 21′ N. lat. and 119° 15′ E. long. The walls are between three and four miles in circumference, and the streets both in the suburbs and in the city are well supplied with handsome shops. The temples, colleges, and other public building are fine and large, and there is generally a well-to-do look about the place. The flourishing trade of the town may be either the cause or the result of an almost Jewish predilection shown by the people for mercantile pursuits. Unlike Chinamen generally, they prefer trade to husbandry, and have earned for themselves pre-eminence as a community of shopkeepers. Another of their characteristics is their extreme superstition. Their observance of full moons and festivals exceeds in ritualistic display that which is commonly thought to be good enough for such occasions by their fellow countrymen; and their jealousy for the honor of their gods has on more than one occasion led to religious outbreaks. The most violent of these fanatical ebullitions, so far as foreigners are concerned, occurred in 1868, when Mr. Hudson Taylor first attempted to open a mission there. But Yang-chow Fu possesses an earlier historical connection with foreigners. Marco Polo ruled over it for three years by appointment from Kublai Kahn (? 1282–85). The great traveller speaks of it as a "noble city," "which has seven and twenty other wealthy cities under its administration. . . . The people," he adds, "are idolaters and use paper money." They "live by trade and manufactures, for a great amount of harness for knights and men-at-arms are made there." The population of the city and suburbs is estimated at about 360,000. In 1880 the value of foreign goods imported into the town amounted to about £96,956 [$471,206].

YANG-TSE KIANG, or Yang-tsze Keang. See China, vol. v. p. 548.

YANINA. See Janina.

YANKTON, one of the principal cities of the Territory of Dakota, United States, and until recently its capital, is the county seat of Yankton county, and is situated upon both banks of the James or Dakota river at its confluence with the Missouri, and on the Chicago and St. Paul and the Chicago and Northwestern Railroads. It serves as a centre of supply and distribution for the adjacent fertile plains. The population in 1880 was 3431; in 1888 this had probably increased to 5000.

The city derives its name from the Yankton division of the Sioux Indians. A trading-post was first established on its site in 1859, and the city was incorporated ten years later.

YARKAND, or Yarkend, the chief town of the principal oasis of East Turkestan, is situated on the Yarkand Daria, in 38° 25′ N. lat. and 77° 16′ E. long., at an altitude of about 4100 feet above sea-level. The settlements of the Yarkand oasis occupy the southwestern corner of East Turkestan, and are scattered along the numerous rivers which issue from the steep slopes of the Pamir in the west, and the Karakorum and Kuen-Lun Mountains in the south. The oasis of Kashgar limits it in the north, and a tract of desert separates it from the oasis of Khotan in the southeast. The Yarkand-Daria and its numerous tributaries, which are fed by the glaciers of the mountain regions, as also many rivers which no longer reach the main stream but are lost in the steppe or amidst the irrigated fields, bring abundance of water to the desert; one of them is called Zerafshan ("gold-strewing") as much on account of the fertility it brings to the desert as of the small amount of gold discovered in its auriferous sands. Numberless irrigation canals, some of them of considerable length, carry the water of the rivers to the fields, which occupy a broad zone of loess skirting the base of the mountains. Higher up, in the spurs of the mountains, there are rich pasturages, where large numbers of goats, yaks, camels, sheep, and cattle are reared. On the whole, the oasis of Yarkand is regarded as the richest of East Turkestan, and its population probably numbers about 200,000 inhabitants (32,000 households in 1873). Wheat, barley, rice, beans, and various oil-yielding plants are grown in the fields, and the gardens supply abundance of melons, grapes, apples, and other fruits. The cotton tree and the mulberry are cultivated in the warmer parts of the oasis. There is no lack of gold, lead, and precious stones in the mountains, though only the first-named is at present extracted. A variety of petty trades are carried on in the towns; Yarkand is renowned for its leather-ware and saddlery. The population consists of Persians, who have almost given up the use of their mother tongue and now speak Turkish, and of Turkish Sarts.

The town of Yarkand, which has a population of about 60,000 according to Forsyth (5000 houses in the city, and as many in Yanghishar and the suburbs), is very favorably situated on the river of the same name, five days' journey southeast from Kashgar. It is surrounded by a thick earthen wall, nearly four miles long, with towers in the Chinese style of architecture, and is well watered by numberless canals, which are drawn from the river and, after having irrigated the rich gardens of the city, lead to cisterns in which water is collected for the winter. The square fortress of Yanghishar, which was built by the Chinese, stands within four hundred yards of the walls of the town. The ten mosques and madrasas of Yarkand, although much poorer than those of Bokhara or Samarcand, enjoy a wide renown in the Moslem world. There is a brisk trade, especially in horses, cotton, leather-ware, and all kinds of imported manufactured goods.

Yarkand is surrounded by a number of smaller towns, the chief of which are—Yanghi-hissar, which has about 600 houses and is the centre of a populous district, Tashkurgan on the Pamir, now reckoned as belonging to the Russians, Posgam (1600 houses), Kargalyk, at the junction of the routes leading to Ladak and Khotan (2000 houses), Sanju (2000), Tagarchi, Kartchum, Besh-taryk (1800), Guma (3000), and several smaller ones.

Yarkand was but very imperfectly known until the second half of the 19th century. Marco Polo visited it between 1271 and 1275, and Goes in 1603; but the continuous wars which marked the history of the oasis (see Turkestan, vol. xxiii. p. 679) prevented Europeans from frequenting it, so that until 1863 the information borrowed from mediæval travellers and from Chinese sources, along with that supplied by the pandit Mir Isset Ullah in 1812, was all that was known about the Yarkand region. The first European who reached it in the 19th century was Adolph Schlagintweit, who passed by Yarkand in August, 1857, but was killed a few days later at Kashgar. The pandit Mohammed Hamid visited it in 1863 and determined its geographical position and altitude. The best recent information is due to Robert Shaw[2] and G. W. Hayward, who stayed at Yarkand in 1869, and to Sir Douglas Forsyth, who first visited it in 1870. Three years later he visited it again with an expedition which had Gordon, Bellew, Chapman, Trotter, Biddulph, and Stoliczka as members, and afterwards published a detailed report upon the scientific results of the

[1] [Larousse's *Dictionnaire* gives the area at nearly 8150 acres and the population at about 7000, with which Keith Johnston's *Dictionary of Geography* substantially coincides.—Am. Ed.]

[2] R. Shaw, *Visits to High Tartary, Yarkand, and Kashgar*, London, 1871.

mission.[1] In 1886, after a remarkable journey through East Turkestan, A. D. Carey reached Yarkand and spent the winter there.

YARMOUTH, or GREAT YARMOUTH, a municipal and parliamentary borough, seaport, watering place, and important fishing station of England, chiefly in Norfolk, with a small portion (of the municipal borough only) in Suffolk, is situated on a long and narrow peninsula of sand, bounded on the west by the river Bure, the Breydon (formed by the Yare and the Waveney), and the estuary of these rivers. It stands on the Great Eastern and the Eastern and Midland Railway lines, 20 miles east of Norwich and 122 northeast of London. The old town of great Yarmouth was built chiefly along the eastern bank of the Yare, but within recent years the town has extended beyond its ancient walls, of which some remains still exist, to the seashore, where there are a marine drive and three piers—two of them 700 feet long. The principal features of Yarmouth are the north and south quays, and the straight narrow lanes, 145 in number, called "rows," running at right angles to them. These rows were at one time inhabited by the wealthy burgesses, and many of the houses now tenanted by the poorer classes have curiously panelled rooms, with richly decorated ceilings. The market place of Yarmouth is one of the most spacious in the kingdom, its area being about three acres. The old town of Great Yarmouth is connected with Little Yarmouth by a bridge across the Yare of stone and iron, erected in 1854. The Bure is crossed by a suspension bridge. The church of St. Nicholas, founded in 1101 by Herbert Losinga, the first bishop of Norwich (who removed the see from Thetford), and consecrated in 1119, is one of the largest parish churches in England. Originally it was in the form of a Latin cross, but only the tower of the ancient building remains; and by successive alterations the form of the church has been completely changed. The clerestoried nave in the Early English style, with columns alternately octangular and circular, was rebuilt in the reign of King John. A portion of the chancel is of the same date. About fifty years later the aisles were widened, so that the nave is now the narrowest part of the building. A grand west front with towers and pinnacles was constructed in 1330–38, but the building was interrupted by a visitation of the plague. Within the church there were at one time eighteen chapels, maintained by guilds or private families, but these were demolished by the Reformers, who sold the valuable utensils of the building and applied the money to the widening of the channel of the harbor. During the Commonwealth the Independents appropriated the chancel, the Presbyterians the north aisle, and the Episcopalians were allowed the remainder of the building. The brick walls erected at this time to separate the different portions of the building remained till 1847. In 1864 the tower was restored, and the east end of the chancel rebuilt; in 1869–70 the south aisle was rebuilt; and in 1884 the south transept, the west end of the nave, and the north aisle underwent restoration. The width of the nave is 26 feet, and its length to the tower 117, that of the tower 27 feet, and of the chancel 92,—total 236 feet. The Roman Catholic church is a handsome Gothic building erected in 1850. In 1551 a grammar school was founded, the great hall of the dissolved hospital, founded in the reign of Edward I. by Thomas Fastolfe, being appropriated as the building. The school was closed from 1757 to 1860, when it was re-established by the charity trustees; and in 1872 new buildings were erected. In the hospital school a number of boys and girls were formerly boarded and educated, but since 1850 the charity has been administered as a place of free education only. Among the other principal public buildings are the town-hall and public offices, of red brick and red sandstone in the Queen Anne style of architecture, with a tower 125 feet in height, erected in 1883; the aquarium, erected in 1877 and extended in 1882; the old toll-house, formerly the town-hall, a building of the 14th century, which has been carefully preserved as a relic of antiquity; and the assembly and reading rooms, the drill-hall, the custom-house, the barracks at Southtown, the bathhouse, the workhouse, the public library, and two theatres. A Doric column, 144 feet in height, was erected on the downs in 1817 to the memory of Nelson. Among the charitable and benevolent institutions are the royal naval lunatic asylum, originally founded as a lunatic hospital in 1811; the sailors' home (1859), the boys' home (1870), the Walrond memorial smack-boys' home (1875), the fishermen's hospital (1702), and Warne's and various minor charities.

Yarmouth Roads, except in east or northeast winds, afford excellent anchorage. The present channel to the quays was made in 1567 by Joost Jansen, a Netherlands engineer. It affords a depth of water at the bar of 12 feet, and at high water of 18 to 20 feet. The town owes its origin to the fisheries, and is now one of the chief fishing stations on the east coast of England, being specially famed for its herring and mackerel fisheries (see FISHERIES, vol. ix. pp. 218–20), while cod and other white fish are also caught in great quantities. The number of boats registered under the Fisheries Act in December, 1886, was 439, employing from 4500 to 6100 men and boys. The boats engaged in fishing are mostly trawling smacks. The curing of fish is an important industry, Yarmouth bloaters being celebrated throughout the kingdom. A great stimulus was given to the fishing trade by the erection of a fish wharf in 1869, having a length of 2257 feet. There is a considerable inland trade on the rivers by means of lighters and wherries. In 1883 the value of the imports of foreign and colonial produce reached £285,742 [$1,374,126.12], and, although in 1886 it sank to £173,636 [$843,870.96], the average for the five years preceding 1888 was about £235,000 [$1,142,100]. The value of the exports in 1882 was £3399 [$16,519.14] and in 1886 £14,706 [$71,471.16]. The principal imports are coal, timber, and provisions. The trade is chiefly with the Baltic ports, France, Portugal, Spain, the Channel Islands, the United States, and British North America. The number of vessels engaged in the foreign and colonial trade that entered in 1886 was 191 of 38,134 tons, that cleared 99 of 18,299 tons. The number in the coasting trade was 1033 of 110,312 tons entered, and 1083 of 124,527 tons cleared. Steam-packets ply between London, Hull, and Newcastle. Ship-building and boat-building are carried on chiefly in connection with the fisheries, the number built in 1886 being 11 of 781 tons. There are also rope, twine, and trawl-net manufactories, silk-crape works, and extensive maltings. Yarmouth is frequented in summer as a seaside resort. It is governed by a mayor, twelve aldermen, and thirty-six councillors. The corporation act as the urban sanitary authority. Water is obtained from one of the "broads" at Ormesby. The borough has a separate commission of the peace and court of quarter-sessions. The population of the municipal borough (area 3685 acres) was 41,819 in 1871 and 46,159 (9008 being in Gorleston in Suffolk) in 1881.

At the close of the 5th century Yarmouth is said to have been the landing-place of a Saxon invader Cerdic. At an early period it was resorted to by fishermen from the Cinque Ports and from the Continent for the herring-fishing, who dried their nets on the denes or downs, and also erected tents where they sold their fish to merchants from London and elsewhere. At Domesday the place is described as the king's demesne, and as having seventy burgesses. Henry I. appointed a provost as governor, and in the 9th year of John it received a charter of incorporation. It received another charter from Henry III., who permitted the inhabitants to enclose the borough with walls and moats. In 1338–39 the town suffered severely from the plague, during which 7000 persons are said to have died. In 1381 the rebels under Wat Tyler were defeated by

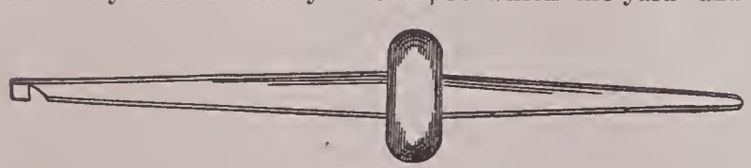
[1] *Report of a Mission to Yarkund in* 1873, Calcutta, 1875, with numerous photographs.

the inhabitants of Yarmouth. The town also rendered considerable assistance when England was threatened by the Spanish Armada; in recognition of this Elizabeth empowered the "bailiffs, burgesses, and commonalty" to hold an admiralty court, and extended their liberties in other ways. In 1588 a castle was built in the centre of the town, and a mound called the south mound raised and crowned with heavy ordnance. The castle was demolished in 1621 and new fortifications thrown up, having a circuit of 2½ miles. On account of the hardship experienced by the town from the levying of ship-money by Charles I., it declared for the Parliament. At the close of the war the fortifications were demolished. From an early period the Cinque Ports had the power of sending bailiffs to Yarmouth to govern the town during the herring-fishing season, from Michaelmas to Martinmas, their jurisdiction being concurrent with that of the bailiffs of Yarmouth; but on account of the jealousies that were thus created the privilege was abolished in the reign of Charles II. Until the Act of William IV. the town was governed by a charter of Queen Anne. It sent two members to parliament from the reign of Edward I. till 1867, when it was disfranchised; but by the Act of 1885 it was again allowed to return one member.

(T. F. H.)

YARN consists of any textile fibre prepared by the process of spinning for being woven into cloth. It is only in a few minor and exceptional cases, such as the weaving of hair-cloth or of wire, that there is any making of woven fabrics without the previous spinning of yarn. As weaving can be shown to be among the earliest and most universal of the industries of mankind, the process of spinning yarn, which of necessity accompanies or rather precedes weaving, can be claimed as one of the primal employments of the race. There is ample evidence obtainable, not only of the great antiquity, but also of the wide—almost universal—diffusion of the art of spinning. Remains of the implements employed are found wherever traces of prehistoric and early man make their appearance. It happens that the exceedingly simple apparatus which was used in the earliest ages continued to be the spinning implements of civilized communities till comparatively recent times, and it may therefore be said that there is no art which has been more widely diffused, more uniformly practiced, and which remained so long fixed and unprogressive, as that of yarn-spinning. On the other hand, since human ingenuity bent itself to improve the art—and these efforts only began in earnest about the middle of the 18th century—there have not been developed in the whole range of mechanical industries implements of greater variety, complexity, delicacy of action, and manifold productive capacity than the varied machines now adapted for the production of yarn.

The primitive spinning implement consists of a spindle, a rod of wood, usually from 9 to 12 inches in length, rounded and tapering towards both extremities, as shown in the accompanying cut. At the upper extremity there is usually a notch, in which the yarn



Primitive spindle.

is caught while undergoing the operation of twisting, and to the spindle there is commonly added a whorl—a perforated disk of stone or other heavy material—the object of which is by its weight to give momentum and steadiness to the spindle when it is rotated by the hands of the spinner. The fibre to be spun is commonly attached loosely to a distaff or "rock" of wood, which is held under the left arm of the operator; but in the case of certain short fibres the material is made up in rolls or cardings. A rotatory motion is given to the spindle by twirling it between the fingers of the right hand; and the fibre to be spun is then drawn out in a uniform strand between the fingers of both hands and simultaneously twisted into yarn by the rotating spindle to which it is attached. The portion that is sufficiently twisted is wound on the body of the spindle, and the operation is continued till the spindle is filled with yarn of a smooth and equal calibre. The quantity thus rolled up gives the name to a now definite measure of yarn, "the spindle." Simple and primitive as is this apparatus, a dexterous and experienced spinner is able to produce yarn of an evenness, strength, and delicacy such as can scarcely be exceeded with the aid of the most complicated appliances and by the numerous processes of perfected modern spinning. The cotton yarns with which the famous Dacca muslins of India,—textures which from their extreme flimsy airiness receive such names as "woven air" and "evening dew,"—are spun with the aid only of these simple and rude appliances. The spindle used by the deft Hindu is a slender strip of bamboo not much bigger than a darning needle, lightly weighted with a pellet of clay; and, as the tender thread formed cannot even support the weight of so slight a spindle, the apparatus is rotated in a socket, which consists of a piece of hollow shell. The spindle as here described was the sole apparatus with which, so far as is known, the whole of the yarn woven into cloth by mankind till comparatively modern times was made, and even at the present day it is not wholly obsolete. Apart from its use in Eastern countries and among the untutored tribes of Central Africa, the spindle in its original form continues to be used in the remote districts of the Scottish Highlands and islands, and in many other regions of Europe.

Throughout all the changes and developments of modern yarn-spinning the rotating spindle continues to be the essential implement, and all the improvements which have been effected have had for their object,—(1) the providing of mechanical means of rotating the spindle, (2) an automatic method of drawing out and attenuating the fibre, and (3) devices for working a large group of spindles together.

The first improvement on the simple spindle consisted in mounting it horizontally in bearings, and giving it a rotatory motion by a band from a large wheel, passing round a small pulley or "wharve" fixed on the spindle itself. Such was the first spinning wheel, which in the form of the "charka," has long been known in the East Indies; and from a drawing in a 14th-century MS. in the British Museum it is obvious that it was not unknown, although certainly far from common, in Europe at that early date. A jewelled model hand-wheel of this description was formerly the property of Mary of Guise. This form of wheel came ultimately to be known in Scotland as the "muckle wheel," in contradistinction to one of later invention, and the method of working it is not yet au altogether forgotten art.

No strict record of the dates at which various developments of the art of spinning took place are to be found, and it is certain that many appliances were long known and to some extent used before their adoption became general. Thus it is quite clear that the flier, which is fitted around modern spindles for twisting the yarn before it is wound on the bobbin, was known to Leonardo da Vinci and probably invented by him. Among the numerous mechanical drawings left by that man of genius there is one which shows a spindle with flier and bobbin, with a device for moving the bobbin up and dowu on the spindle so as to effect au even distribution of the yarn. But the use of the flier does not seem to have been known in England till about the end of the 17th century. In a pamphlet issued in 1681 by Thomas Firmin, entitled *Some Proposals for the Employment of the Poor*, there is an illustration of an improved wheel, with two spindles provided with fliers, having on them hooks or pins for directing the yarn on different parts of the bobbin. The sketch also shows the spindle and flier driven by different bands, as was the case with the spinning-wheel which subsequently came into common use. In hand-spinning the further application of the treadle motion, with connecting-rod and crank-axle to drive the little wheel with the feet alone, was the final development. By this agency both hands of the spinner were free, continuous and uniform motion were secured, and the spiuner could work two spindles simultaneously, the one with the right and the other with the left hand. It was in this condition

that the most advanced form of yarn-making was carried on in the 18th century, when a great series of inventions revolutionized the entire range of textile industries and laid the foundation of the gigantic factory system of spinniug and weaving which now prevails.

The problem which lay before inventors was to bring tangled masses of fibrous material into parallel order, and to draw out and twist these fibres into nniform strands by automatic means, without the continuous application of intelligent attention. The first stage in the evolution of mechanical spinning was effected under the patent of Lonis Paul in 1738, in which there was clearly described and foreshadowed what is now one of the most important features of spinning machinery—the drawing rollers. In his specification he says:

"One end of the mass, rope, thread, or sliver is put betwixt a pair of rowlers, cillinders, or cones, or some snch movements, which, being turned round, by their motion draws in the raw mass of wool or cotton to be spnn, in proportion to the velocity given to sneh rowlers, cillinders, or cones. As the prepared mass passes regnlarly throngh or betwixt these rowlers, cillinders, or cones, a succession of other rowlers, cillinders, or cones, moving proportionably faster than the first, draw the rope, thread, or sliver into any degree of fineness which may be required."

Next, to James Hargreaves of Blackburn is due the first conception of the famous spinning-jenny, which he devised about 1767 and patented in 1770. In his specification Hargreaves describes his invention as a machine or engine to be managed by one person only, and that the wheel or engine will spin, draw, and twist sixteen or more threads at one time by a turn or motion of one hand and a draw of the other. At the same time the humble barber of Preston, Richard Arkwright, was busily engaged in developing the important series of inventions and adaptations which resulted in the modern throstle spinning-frame. Arkwright's principal patents were secured in 1769 and 1775; and in the latter year Samuel Crompton of Bolton brought before the world his mule spinning-frame, in which the drawing rollers of Paul and Arkwright were with happy effect applied to the jenny of Hargreaves. These inventions are at the foundation of all modern systems of yarn-spinning; details regarding them are given under COTTON, LINEN, SILK, and WOOL.

The various methods by which the sizes or counts of yarn have been fixed in different conntries have long been a source of much inconvenience in the internatioual exchange of spnn yarns. The methods of estimating sizes or weights of yarn are indeed complicated in the extreme, for not only has each country different standards, which may locally be disregarded, but for the yarn from each separate fibre there may be different lengths of hank and different methods of estimating sizes. Thus, taking English standards, we find that cotton yarns are made up into hanks of 560 "threads" of 1½ yards, giving 840 yards per hank, and the "counts" are the number of hanks which go to make 1 lb weight of yarn. For liuen yarns there are 2½ yards in a thread, and 120 threads or 300 yards in a lea, and the eount is the number of leas per lb. In a hank of worsted or woollen yarn there are 560 yards, and the connt similarly is the number of hanks per lb. In Contiueutal countries the length of the hank or its eqnivalent is different; the weight by which the count is reckoned also varies; and, as the weights and measnres of the several countries have ouly the most involved ratio to each other, to estimate comparative sizes complex calculated tables are necessary. Attempts have been made to establish an international standard of numbering yarns based on the French metric system, in which the conut is the nnmber of grams which a definite length of yarn—1000 metres—weighs. No progress, however, has been made in coming to an international agreement in the qnestion. (J. PA.)

YAROSŁAVL, a government of central Russia, separated from Moscow by narrow strips of Vladimir and Tver on the S., and having Tver and Novgorod on the W., Vologda on the N., and Kostroma on the E., is one of the smallest, but at the same time one of the most populous and industrial governments of Great Russia. It has an area of 13,751 square miles, and the population was 1,118,130 in 1884. It consists of a broad and shallow depression, elongated from west to east, where the Volga flows at a level ranging from 260 to 230 feet above the sea, while the surrounding hills rise to altitudes of from 700 to 800 feet. In the west, especially between the Mologa and the Sheksna, the country is covered with marshes and ponds, which become completely flooded when the water rises in the rivers. There is another region of low and marshy tracts in the south, about Rostoff. Gentle sloping hills appear in the north on the left bank of the Sheksna.

Jurassic clays, sandstones, and sands cover nearly the whole of Yaroslavl, but they are coucealed almost everywhere by thick deposits of Glacial boulder clay, which is regarded by Russian geologists as the bottom moraine of the great ice-cap of the Glacial period. Triassic "variegated marls," widely diffused throughout the whole of the middle Volga region, undoubtedly underlie nearly all the Jurassic deposits of the government, but only a few patches come to the snrfaee; many salt springs exist in these deposits. The Upper Carboniferous limestoues come to the surface only in the northwest and towards the east.[1] The chief mineral prodncts are bog-iron ores, sulphate of copper, and pottery clay. Peat oecurs in thick beds. There are also several mineral springs. The soil is mostly a kind of loess of moderate fertility; sandy tracts are not uncommon; and wide areas are covered with marshes—relics of the great lakes of the Lacustrine period.

The chief river of the government is the Volga, which traverses it for 180 miles, making a great bend to the north. The chief towns—Rybinsk, Yaroslavl, Mologa, Romanoff-Borisoglyebsk, Uglitch, and Myshkin—are situated on its banks, and a brisk traffie is carried on, both by the river itself and by two canals, Mariinsk and Tikhvinsk, which connect it with the Neva throngh its tributaries the Sheksna and the Mologa. Another tributary received by the Volga within the government is the Kotorost, which has many manufactories on its banks and is navigated, especially in spring. The Kostroma flows along the eastern border and is a channel for the export of timber and fuel. Small lakes are nnmerous, the chief being Lake Nero or Rostoff. The forests, which consist chiefly of fir and Scotch pine, cover one-third of the aggregate area; bnt they are rapidly being destroyed. The flora of Yaroslavl, although similar to that of Moscow, bears a northern stamp owing to the presence of the dwarf birch, *Rubus arcticus*, and *Linnæa borealis*.

The climate is as continental as that of middle Russia generally. The average temperaturc at Yaroslavl is 36.7° Fahr. (January 6.5°, July 61.5°); the prevailing southwestern and western winds render it moister than in central Russia; and the average nnmber of days with rain or snow is 114. The rivers remain frozen from 118 to 183 days every year.

The population is thoroughly Great Rnssian. The aboriginal Meryas have been completely Russified; and traces of the Karelians, who immigrated in the 17th century, can only be discovered in the names and features of some inhabitants on the Siti river. Therc are moreover some 1000 Tartars, 2100 Jews, and abont 500 Gypsies. Leaving out of account some 2700 Catholics and Protestants, the popnlation belongs to the Greek Orthodox Church or is *Raskolnik*.

Although Yaroslavl is one of the chief manufacturing governments of the empire, its inhabitants have by no means abandoned agriculture, 27 per cent. of the total area being nnder crops (36 per cent. under forests and 8 per cent. nntillable); on the lands of the peasantry the percentage is still greater (from 46 to 58 per cent.). Rye, oats, and barley, with some wheat and pease, are the chief crops, and in good seasons Yaroslavl has even a surplus of corn, which is either sent to the distilleries or exported. The average crops of 1883–85 were 960,100 qnarters of rye, 36,000 of wheat, 97,400 of barley, 1,097,100 of oats, 19,600 of other grain, and 6,992,800 bushels of potatoes. Nearly 40,000 cwts. of flax are cropped every year. Market-gardening is largely engaged in and the Yaroslavl gardeners have a wide repute throughout Russia. Chicory, sweet pease, cucumbers, apples, and berries are exported. Although there is no want of meadows, cattle-breeding is not greatly developed. In 1882–84 there were 178,370 horses, 260,000 cattle, 188,700 sheep, and 4700 pigs. Oue-third of the peasant honseholds had no horses. Cheese-making on the co-operative principle has spread extensively of late, owing to the efforts of the *zemstvo;* 93 associations have a yearly production to the value of £12,700 [$61,722]. Domestic trades are carried on in great variety in the villages, inclnding the making of linen, cloth, boots, gloves, sheepskins, knitted wares, clothes, felts, all kinds of wooden wares, pottery, and a varicty of metallic goods. The total production is very considerable, although no details are available. The mannfactures are growing rapidly, the yearly production of 1708 establishments being estimated at £2,210,000 [$10,740,600] in 1884. Cotton and linen are the chief items (nearly £1,000,00 [$4,860,000]); flour-mills, distilleries, and tobacco works come next; and these are followed by chemical works and workshops for

[1] *Geological Survey of Russia*, sheet 56, by Nikitin (Rnssian and German), St. Petersburg, 1884.

machinery, metallic wares, and so on, which are rapidly developing. The trade of the government is very active both on the Volga and on the two railway lines, one of which connects Rybinsk with the St. Petersburg and Moscow line and the other connects Yaroslavl with Moscow and Vologda. Rybinsk and Yaroslavl are the chief commercial centres, but Rostoff, Mołoga, Romanoff, and Poshekhonie also carry on an active trade in corn, timber, and manufactured wares. The total merchandise shipped or discharged to and from the towns and villages of Yaroslavl is estimated at 1,600,000 tons annually, one-half by rail.

One of the most distinctive features of Yaroslavl is the large number of its male population who annually leave their homes in order to work all over Russia as locksmiths, masons, plasterers, waiters in restaurants, greengrocers, tailors, gardeners, carpenters, joiners, pilots, or boatmen. Many of these employments have been specialties of the population of Yaroslavl from a remote antiquity, and the native of this government can easily be distinguished by his enterprising spirit, keen air, and energetic and nervous temperament. In Moscow and St. Petersburg together there are about 76,400 employed in the above capacities, and it may be estimated that as many as 100,000 persons annually leave their homes in this way.

The educational institutions were represented in 1884 by a lyceum (197 students), six gymnasia (569 boys and 1219 girls), a military school (492 boys), a seminary for teachers (81 students), and 745 elementary schools (25,780 boys, 10,140 girls).

Yaroslavl is divided into ten districts, the chief towns of which, with their population in 1884, are—YAROSŁAVL (see below), Daniloff (5780), Lubim (3180), Mołoga (6360), Myshkin (2390), Poshekhonie (5990), Romanoff-Borisoglyebsk (5300). Rostoff (12,450), Rybinsk (19,900), and Uglitch (11,930). Petrovsk (1760) has municipal institutions.

History.—As early as the 9th century the Slavonians had become masters of the Yaroslavl territory, which was formerly occupied by the Finnish stems Vess and Merya, as also by Mordvinians, Muroms, and Tcheremisses in the south. Rostoff was already in existence; but Yaroslavl, Rybinsk, and Uglitch begin to be mentioned in the annals only in the 11th and 12th centuries. The independent principality of Rostoff was divided in the 13th century into three parts, but these were soon afterwards successively annexed to Moscow.

See the *Trudy* of the Yaroslavl Statistical Committee, 8 vols. and the *Vyestnik* of the Yaroslavl zemstvo, published since 1872. (P. A. K.)

YAROSŁAVL, capital of the above government, stands on the right bank of the Volga, at its junction with the Kotorost, 173 miles by rail to the northeast of Moscow, and had a population of 48,310 inhabitants in 1884; but this number is temporarily much increased during the period of navigation. The suburbs of the town occupy the left bank and are inundated at high water. A fine quay borders the Volga for nearly two miles. The cathedrals and several churches are very old. The Uspenskiy cathedral was begun in 1215 and rebuilt in 1648; the churches of the Preobrazhenskiy monastery, St. John's, and Voskreseniye date from the 15th and 17th centuries, the second being a fine specimen of the architectural style exemplified in the Vasiliy Blazhennyi church of Moscow. Yaroslavl has a lyceum, founded by Demidoff, with a juridical faculty, three gymnasia (409 boys, 669 girls), and various primary schools. The manufactories, whose total production in 1862, barely reached the value of £200,000 [$9,720,000] now employ 5100 hands and yield an output valued at about £1,000,000 [$4,860,000] (one-half from one cotton-mill). The trade, especially that in corn, is very active and accounts for one-quarter of the whole traffic of the government. The Yaroslavl merchants also carry on a large import trade in manufactured goods and groceries.

The town of Yaroslavl was founded in 1026-1036 by Yaroslav Vladimirovitch, who caused a wooden fort to be erected at the confluence of the Kotorost with the Volga. It became the chief town of a principality in 1218, and remained so until 1471, when it fell under the dominion of Moscow. Even in the 13th century Yaroslavl was an important town, and, although it suffered during subsequent wars, it maintained its importance until the 19th century, when the trade on the Volga and its rising manufactures again gave it a position of predominance in the upper basin of the Volga.

YARRELL, WILLIAM (1784–1856), one of the most popular of British naturalists, was born at Westminster in June, 1784. His father was a newspaper agent, and he himself succeeded to the business on his father's death, and prosecuted it till within a few years of his own. He availed himself of any interval of relaxation to enjoy such sport as the neighborhood of London afforded, acquired the reputation of being the best shot and the first angler in the metropolis, and soon also became an expert naturalist. In 1824, he became a fellow of the Linnean Society, and was a diligent contributor to their *Transactions;* and he was one of the earliest members of the Zoological Society. The greater part of his leisure towards the end of his life was devoted to his two great works, *The History of British Fishes* (2 vols., 1836) and *The History of British Birds* (2 vols., 1843). These works are compiled on the same plan; they contain accurate figures, with accompanying descriptions, of every British fish or bird; and they have from the first taken their position as standard authorities. Few books on natural history are more agreeable to the general reader: the style is pleasant, and the truth with which he describes the habits of the birds is such as might have been expected from a keen and observant sportsman. In 1856, he had an attack of paralysis, of which he died at Yarmouth on 1st September of the same year.

YAWS is the name in use in the British West Indies and on the West Coast of Africa for a peculiar disease of the skin in Negroes. The learned name, first applied by Sauvages (1761), is *frambœsia*, from the likeness of the typical excrescences to a raspberry. For many years yaws was thought to be peculiar to the African Negro, either in his home (both west and east coasts) or in the West Indies and Brazil. But a disease the same in every respect has long been known in the East Indies (first mentioned by Bontius early in the 17th century), affecting the Malays rather than the Negroes, its chief seats being Amboyna, Ternate, Timor, Celebes, Java, and Sumatra. It has been identified more recently by De Rochas and other observers in New Caledonia and Fiji. The *parangi* of Ceylon has been shown by Kynsey to be the same as the West Indian yaws. Also in the Samoa group, to which there has been no Negro migration, an identical malady occurs. The closely allied *verrugas* of the Peruvian Andes (see WART) is so different in its endemic circumstances that it is not usually classified as a form of yaws. The account that follows applies equally to all of the local forms, while it has more especial reference to yaws in the Negroes of the West Indies.

The general course of the disease is as follows. Previous to the eruption there may or may not be any disorder of health; in children (who form a large part of the subjects of yaws (there will probably be rheumatic pains in the limbs and joints, with languor, debility, and upset of the digestion; in adults of ordinary vigor the eruption is often the first sign, and it is attended with few or no constitutional troubles. The eruption begins as small pimples like a pin's head, smooth and nearly level with the surface, they have a little whitish speck on their tops, grow rapidly, and reach the size of a sixpence or a shilling. The pustules then break, and a thick viscid ichor exudes and dries upon them as a whitish slough, and around their base as a yellowish brown crust. Beneath the whitish slough is the raspberry excrescence or yaw proper, a reddish fungous growth with a nodular surface. The favorite seats of the eruption are the forehead, face, neck, armpits, groin, genitals, perinæum and buttocks. Hairs at the seat of a yaw turn white. In young children or infants the corners of the mouth ulcerate, as in syphilis, and the perineal excrescences resemble condylomata. The pustules and excrescences do not all arise in one crop: some are found mature while others are only starting. If the patient be of sound constitution and good reaction, the yaws may reach the full size of a mulberry in a month, in which case they will probably be few; but in persons of poor health they may take three months to attain the size of a wood-strawberry, in which case they will be numerous inversely to their size. Often there is one yaw much larger than the rest, and

longer in falling; it is called the "master yaw" or "mother yaw." On the soles of the feet (less often on the palms of the hands) the bursting yaws are as if imprisoned beneath the horny cuticle; they cause swelling and tenderness of the foot, until set free by paring the callous skin down to the quick; these yaws are called "crab yaws" or *tubbas*. Usually a yaw is painless unless when rubbed or irritated. The absence of pain is used as a diagnostic sign if there be any doubt as to the nature of the attack: a pustule is opened, and a little of the juice of capsicum dropped into it; if it be a yaw, no smarting will be felt. In some cases a few yaws will show themselves long after the primary attack is over; these are called "memba yaws" (from "remember"), the term being sometimes applied also to protracted cases with successive crops of eruption. Six weeks is the average time in a good case, from the first of the eruption to the fall of the excrescences; in such regular cases a scar remains, it may be for many months, darker than the rest of the (Negro) skin. But the disease is often a much more tedious affair, the more protracted type having become common in the West Indies of recent years. In such cases the eruption comes out by degrees and as if with difficulty, crop after crop; foul, excavating, and corroding ulcers may remain, or a limb may be in part seamed and mutilated by the scars of old ulceration. The scars after ulceration are not so dark as the skin around.

That yaws is a communicable disease is beyond question; but that it has always arisen by conveyance of yawey matter from a previous case is neither proved nor probable. Being to a great extent a disease of childhood, it is not usually conveyed after the manner of syphilis, but by contact in other ways (as in the epidemic syphilis of 1494–1520 and in recent circumscribed epidemics). An abrasion or wound of the surface, such as a chigoe bite or a cut of the foot, is a likely point of entrance for the virus. If the yawey matter finds access to a pre-existing sore or ulcer, it causes the latter to take on a foul and sloughing condition. No sore or yaw is induced at the point of infection, which will probably be healed long before the eruption appears. It is said, however, that the pustules appear earliest and in greatest numbers on the skin near the spot where the virus entered. They follow the infection at an interval of several weeks (incubation period). Cases of yaws by infection are not unknown in white persons of good position, both children and adults, in the West Indies and elsewhere.

The nature of the disease is obscure. It is alleged to be hereditary by some, and denied to be so by others; the fact seems to be that some constitutions are much more susceptible than others, and susceptible at some periods or states of health more than at others. As an epidemic, the disease in a locality has seasons of activity and quiet. One attack in childhood gives a large degree of immunity for the rest of life. Yaws used to break out in the slaves on board Guineamen. Both in Africa and among the slaves in the West Indies it was a custom to inoculate the yaws, so as to get the attack over (called "buying the yaws") or to get put upon the sick list.

As regards treatment, the malady in a person of good constitution runs its course and gets well in a few weeks. Whatever tends to check the eruption, such as exposure to chill, is to be avoided. A week's course of cream of tartar and sulphur (confection of sulphur) at the beginning of the illness is often resorted to, so as to bring the eruption well out. The patient should remain indoors, in a well-aired room, and take daily warm baths and diluent drinks. If the excrescences are flabby and unhealthy, it is an indication for generous diet. Mercurial treatment is no longer in vogue. As external applications, weak lotions of zinc or carbolic acid may be used, and, if the excrescences are irritable, a watery solution of opium. Tedious and unhealthy yaws should be dressed with a wash of sulphate of zinc or of copper; the same may be applied to a yaw ulcer. The crab yaws of the horny soles or palms, after they are let through by paring the cuticle, may be dusted with alum powder. The most intractable cases occur in badly nourished and anæmic subjects, and these will often go on for months in hospital without mending. Of late in the West Indies the disease has become largely a *morbus miseriæ*, and to that extent less amenable to treatment.

The date of the first appearance of yaws in the West Indies and Brazil is matter of dispute; the general belief is that it came in with the African Negro. After the emancipation in 1838 there was a marked decline in the prevalence of the disease in Jamaica and other colonies. In Jamaica it began to be seen again from 1854 to 1864, the cases being more of adult age than formerly. The worst recent centre of yaws has been Dominica, which is occupied by Negro communities unprovided with medical attendance. In 1871 the Government opened and maintained two special hospitals for yaws (under a board of commissioners), one at Morne Bruce near Roseau, and the other at Prince Rupert's. In Barbados and Antigua cases of yaws are rarely seen, the population being more creole than Negro. Trinidad has a good deal of the disease from time to time in the inland villages; bad cases are admitted to the leper asylum at Port of Spain. In Grenada, which has a special yaws hospital, and in St. Vincent the immigration of Hindu coolies received a check owing to the ravages made by the disease among them. It prevails also in San Domingo, Guadeloupe, and others of the Antilles. At Berbice and Essequibo there were 23 fatal cases in one year (1870). The disease is common in all parts of Brazil. In Western Africa cases are found along the whole coast from the Senegal to the Congo, and in the interior (Timbuktu and Bornu). On the East Coast it is found in Mozambique, Madagascar, and the Comoros. Its localities in the East Indies and islands of the Pacific have been already mentioned.

For the literature dealing with the subject, see Hirsch, *Geographical and Historical Pathology* (Engl. transl.), vol. ii., London, 1885 (New Sydenham Soc.).

YAZD, or YEZD, a city of Persia, capital of the district of Yazd, province of Farsistán, in 31° 50′ N lat. and 54° 25′ E. long. Yazd stands on a flat sandy plain, about 50 miles broad and encircled by an amphitheatre of picturesque hills, on the high road between Ispahán and Karmán, 190 miles southeast of the former and 220 northwest of the latter place. The old and dilapidated walls enclose a very large space, which, however, is much encumbered with ruins, the population having fallen from about 100,000 at the beginning of the 19th century (Christie) to about 30,000 in 1868 (Smith). Since the famine of 1870 the place has recovered some of its former prosperity, and has at present (1888) an estimated population of 50,000, including 1000 Jews and about 4000 fire-worshippers, Yazd being the only town in Persia where these still form a separate community. There are fifty mosques, sixty-five public baths, eight public schools, but no building of any note except the chief mosque, a very old and decayed structure, which still presents a lofty and imposing frontage. With the exception of a fine new bazaar, which is well stocked with goods and much frequented, the markets and other parts of the town are irregularly planned, with narrow dark streets and little life. Yazd is in fact a city of the wilderness, whose oasis, planted chiefly with mulberries and other fruit trees, is everywhere surrounded by the shifting sands, which at some points already threaten to encroach on the town itself (Maegregor). In this way was engulfed its predecessor, Old Yazd or Askizár, whose ruins are still visible 10 miles to the northwest on the road to Kashan. Nevertheless the local traders maintain their old reputation for intelligence and enterprise, and their agents still visit the distant markets of India, Java, and China. The trade with India formerly carried on through Shiráz now takes the more direct route through Karmán. The exports are chiefly sugar, silks, opium (4000 chests in a single year to China), cordage, cotton, felts, and copper; the imports wheat, rice, cotton goods, and henna. This henna, together with rang for dyeing the hair, is brought from the Mináb and Bandar-Abbás districts to be ground and prepared for the Persian market. From the neighboring villages and the remote province of Ghilán comes the raw material for the silk-looms, which produce two kinds—*kasb* and *aluhí*—both of the very finest quality. Other noted products of the local industries are the felts, equal to the best in Karmán, and the candied sugars and sweetmeats, in the preparation of which the fire-worshippers excel. A great drawback to Yazd is the defective and irregular supply of water, which largely depends on the yearly snow and rainfall on the surrounding hills. The annual revenue averages £35,000 [$170,100] to £40,000 [$194,400], of which three-fifths go to the public treasury; the rest supports the local administration and household of the governor, who resides in a kind of citadel within the city walls.

YEADON, a manufacturing town in the West Riding

of Yorkshire, is situated on a hill north of Airedale, about 1½ miles from Guiscley station on the Midland Railway and 8½ miles northwest of Leeds. The streets are generally irregular and tortuous, but within recent years greater care has been taken in the arrangement of new buildings. The church of St. John in the Pointed Gothic style, erected in 1843, consists of chancel and nave, with square tower surmounted by pinnacles. The town-hall and mechanics' institute, a handsome Gothic building erected in 1883, includes a large public hall, the rooms of the Liberal club and of the local board, and class and lecture rooms. Yeadon is chiefly of modern growth, although wool-combing and cloth manufacture were carried on to some extent before the establishment of the first woollen-mill in 1831. Since 1850 the town has made rapid progress, and now possesses several mills, in which woollen cloths are manufactured, especially materials for ladies' jackets, ulsters, mantles, etc. The township was formed out of Guiseley in 1845. The local board of health was established in 1863. The population of the urban sanitary district (area 1723 acres) was 5246 in 1871 and 6534 in 1881.

YEAR. See CALENDAR, vol. iv. p. 590–93.

YEAST, an insoluble substance forming an essential component of all sacchariferous juices when in the state of vinous fermentation. This subject is pretty fully dealt with under FERMENTATION (see vol. ix. pp. 81, 82, 83, 84, 85); one important application of yeast, however, viz., that which it finds in the baker's trade, is there only referred to. To produce a spongy loaf, the dough, before being made into loaves, is mixed with a ferment which, if allowed to act for a sufficient time before baking, produces alcohol and carbonic acid from a small portion of the actual or potential sugar present; and the carbonic acid, being liberated from within the dough, causes it to "rise." In former times leaven (see BAKING, vol. iii. p. 218) used to be employed exclusively. For higher classes of bakery yeast is now preferred. The yeast produced so abundantly in beer-brewing is available; but its bitter taste is an objection to it. Hence it has long been customary in Germany to produce yeast expressly for bakers' and cooks' purposes, which may, of course, be done in a variety of ways. A method frequently used is to produce a wort (see BREWING, vol. iv. p. 245) from barley, malt, and rye, and by the addition of a little ready-made yeast to let it ferment under conditions which favor the growth of yeast-cells, but restrict the proportion of alcohol produced to a minimum (comp. FERMENTATION, vol. ix. p. 85). During the most tumultuous period of the process the yeast is skimmed off from the surface, washed with water, and either "filter-pressed" or "centrifuged" to obtain it as a relatively dry paste; it is then mixed with a proportion of dry starch, to give it a higher degree of dryness. Such yeast goes into commerce as *presshefe* or *pfundhefe* (German yeast or barm). This industry used to be a monopoly of Germany; but quite lately the manufacture of German yeast has been taken up in Scotland.

YEDO. See TOKIO.

YEISK, a district town of the Russian province of Kuban (Caucasus), was founded in 1848 at the mouth of the Yeia, on a narrow sandbank which separates the shallow Bay of Yeisk from the Sea of Azoff, 108 miles to the southwest of Rostoff-on-the-Don. Notwithstanding its shallow roadstead, which has a depth of 14 feet only at 2 miles from the shore, Yeisk has grown with great rapidity, and in 1884 had 23,725 inhabitants. Corn, linseed, and wool are exported to a considerable extent (1,730,000 cwts. of corn and flax and 10,000 cwts. of wool in 1885), and the port was visited in 1886 by 69 ships (30,000 tons) engaged in foreign trade and by 697 (80,800 tons) engaged in the coasting trade. There are large wool-cleansing factories, oil-works, and tanneries.

YEKATERINBURG. For this and similar forms of Russian town-names, see EKATERINBURG, etc.

YELETS, a district town of the Russian government of Orel, 121 miles by rail to the east of Orel, stands on the great trunk railway which connects Riga with Tsaritsyn on the lower Volga; a branch line connects it also with the railway which runs from Tula to Samara and Orenburg. Owing to its advantageous position Yelets, which had been for a long time an important entrepôt for the corn trade, has rapidly grown of late, and in 1883 had 36,680 inhabitants. The Yelets merchants buy large quantities of grain in the fertile neighboring provinces, and send their agents to southern and southeastern Russia; nearly 150 flour-mills, many of them driven by steam, prepare flour, which is forwarded chiefly to Moscow and partly to Riga. The trade in cattle is also very important. Yelets has become of late a manufacturing centre, and has some important tanneries, foundries for cast-iron and copper, tallow-melting works, sieve manufactories, etc. The town has several educational institutions. Its cathedral and two monasteries contain venerated historic relics.

Yelets is first mentioned in 1147, when it was a fort of Ryazañ. The Polovtsys attacked it in the 12th century, and the Mongols destroyed it during their first invasion. The Tartars plundered it in 1415 and 1450; and it seems to have been completely abandoned in the latter half of the 15th century. Its development dates from the second half of the 17th century, when it became a centre for the trade with south Russia.

YELIZAVETGRAD. See ELIZABETHGRAD.

YELIZAVETPOL. See ELIZABETHPOL.

YELLOW FEVER is a typhus-like fever of certain ports, or of ships hailing from them. It differs from all other existing types of fevers and infections in largely sparing the Negro. It resembles cholera in being endemic in some parts of the world (but only shipping places) and in being importable to others, in being an infection that issues from the soil or some medium equivalent thereto, and in being a virulent filth-disease; but it differs from cholera in having at the outset a violent febrile paroxysm lasting two or three days. As a fever it resembles typhus; but it differs from typhus in all those "exogenous" characters wherein it resembles cholera. The generic place and affinities of yellow fever are perhaps best provided for in the nosology of Cullen: the symptoms are within the sphere of the organic nervous system; they stand for excitement first and prostration afterwards; and they are an effect of human effluvia. Its differentia among the "nervous" fevers due to "human effluvia" would be its maritime or amphibious habitat, its association with tropical heat, the chief part played by the liver in its symptomatology (on the lines of acute yellow atrophy), and the singular immunity of the Negro race. Type and circumstances.

An attack of yellow fever may follow definite exposure (such as landing at an endemic port) within a few hours, as in corresponding cases of cholera; but the outbreak of symptoms is more often delayed for a few days, the limit of "incubation" being about eight. The few hours' languor, chilliness, headache, and muscular pains, which might be the precursors of any febrile attack, are followed by a peculiar look of the eyes and face, which is characteristic; the face is flushed, and the eyes suffused at first and then congested or ferrety, the nostrils and lips red, and the tongue scarlet,—these being the most obvious signs of universal congestion of the skin, mucous membranes, and organs. Meanwhile the temperature has risen to fever heat, and may reach a very high figure (maximum of 110° Fahr., it is said); the pulse is quick, strong, and full, but may not keep up in these characters with the high temperature throughout. There are all the usual accompaniments of high fever, including hot skin, failure of appetite, thirst, nausea, restlessness and delirium (which may or may not be violent); albumen- Characteristics.

will nearly always be found in the urine. The fever is a continued one so long as it lasts; but the febrile excitement comes to an end after two or three days. In a certain class of ambulatory or masked cases the febrile reaction may never come out, and the shock of the infection after a brief interval may lead unexpectedly and directly to prostration and death. The cessation of the paroxysm makes the *stadium*, or lull, characteristic of yellow fever. The hitherto militant or violent symptoms cease, and prostration or collapse ensues. The internal heat falls below the normal; the action of the heart (pulse) becomes slow and feeble, the skin cold and of a lemon-yellow tint, the act of vomiting effortless, like that of an infant, the first vomit being clear fluid, but afterwards black from an admixture of blood. It is at this period that the prospect of recovery or of a fatal issue declares itself. The prostration following the paroxysm of fever may be no more than the weakness of commencing recovery, with copious flow of urine, which even then is very dark-colored from the presence of blood. The prostration will be all the more profound according to the height reached by the temperature during the acute paroxysm. Much blood in the vomit and in the stools, together with all other hæmorrhagic signs, is of evil omen. Constant hiccough, with loud cries or wailing, is a certain sign of death, which may also be ushered in by suppression of urine, coma, and convulsions, or by fainting from failure at the heart. The proportion of recoveries is usually less than one-half; but it has been now and then very large (as in the New Orleans epidemic of 1878). Convalescence is on the whole rapid; but, if some old disease, such as ague, have been lighted up, or abscesses induced, it may go on slowly for months. One attack of yellow fever confers a high degree of immunity from a second.

Treatment.

The treatment of yellow fever has been one of the classical subjects of controversy. In the Philadelphia epidemics of the end of the 18th century, Rush gained much credit for his incessant labors in bleeding the victims during the violence of the paroxysm. Although blood-letting to relieve the congestions has been given up, experience still favors the resort to vigorous measures at the outset. The following practice was adopted with much success by Dr. Joseph Jones during the epidemic of 1878 at New Orleans,—an emetic of ipecacuanha, followed by a powder of calomel (10 to 20 grains), with as much quinine added (the latter ingredient of doubtful utility), and that again followed by a full dose of castor oil. Beyond that heroic medication at the outset of the febrile paroxysm, the treatment was directed to assisting the action of the skin and kidneys, by keeping the temperature of the room uniform, by mustard foot-baths, and by copious draughts of lemonade or other aerated water, or of barley water. The diet indicated is fever diet: *i.e.*, it should exclude solid food. For such symptoms as tenderness over the stomach a mustard poultice is applied; for diminished secretion of urine, dry cupping over the loins. When the lull occurs, the patient should on no account be allowed to get up, as sudden failure of the heart is apt to follow exertion. Iced champagne and beef-tea are found to be the best supports for this stage. The only thing to do when black vomit threatens is to give the patient ice to suck, or (more questionably) to place an ice-bag on the abdomen. When the stage of prostration assumes a "typhoid" character, an enema of ice-cold water, with a little turpentine in it, helps to get rid of the flatus and to stimulate the kidneys. Recovery is in all cases more probable where there is abundant cubic space and good ventilation.

Pathology.

Yellow fever is of the nature of typhus, in the language of older writers, a nervous or putrid fever. The two salient things about it are the internal hæmorrhages and the almost complete arrest of the function of the liver; of these the latter would seem to be primary and the former secondary. The state of the liver on examination after death from yellow fever is by far the most significant feature in the morbid anatomy; the bile-ducts and gall-bladder are empty, or contain only a clear albuminoid fluid; the organ is bloodless and of a golden yellow color; and the hepatic cells are everywhere full of fatty granules or other molecular detritus. It shows, in fact, the morbid anatomy of acute yellow atrophy, or that state of the hepatic structure and functions which is due to total inhibition or arrest (see PATHOLOGY, vol. xviii. p. 395), whether the inhibiting influence be phosphorus poisoning, or emotional strain, or something in the pregnant state, or the infective influence of yellow fever. All the other phenomena of this fever are grouped around the liver derangement, as around a centre, namely, the yellow tint of the skin, the fatty degeneration of the heart favoring syncope, the hæmorrhages from the mucous membranes (including the black vomit), the degeneration of the renal epithelium with albuminuria, and the coma and convulsions. Yellow fever therefore may be styled a sudden or arbitrary infection imposed from without, the distinctive mark or "note" of which is the same peculiar group of symptoms that is found in the rare and sporadic cases of yellow atrophy. To reach the full and correct doctrine of yellow fever, we have to harmonize the clinical and pathological facts of the disease, as already given, with the historical, geographical, racial, and other associated circumstances now to be stated.

History and geographical distribution.

The first authentic account of yellow fever comes from Bridgetown, Barbados, in 1647, where it was recognized as a "nova pestis," that was unaccountable in its origin, except that Ligon, the historian of the colony, who was then on the spot, connected it with the arrival of ships. It was the same new pestilence that Dutertre, writing in 1667, described as having occurred in the French colony of Guadeloupe in 1635 and 1640; it recurred at Guadeloupe in 1648, and broke out in a peculiarly disastrous form at St. Kitt's the same year, and again in 1652; it 1655 it was at Port Royal, Jamaica; and from those years onwards it became familiar at many harbors in the West Indies and Spanish Main, and in the Atlantic ports of the British American colonies. It is a question whether it had not occurred at Porto Rico, San Domingo, and other places in the Spanish Antilles a good many years before; but the reports from the colonies of New Spain, both for that and subsequent periods, are highly defective as regards the data needed to distinguish yellow fever from the bilious remittent form of malarial fever, which is a non-infective sickness. The Mexican form of typhus, called "matlazahuatl," which has been an indigenous disease of the native population in the interior for several centuries, has no other connection with yellow fever than that it belongs to the same family of typhus; its circumstances are quite different, especially in respect that it is a purely inland form of *febris pauperum*. In 1853 yellow fever appeared for the first time at Callao and Lima in Peru; and almost in the same months a severe epidemic prevailed among the plantation hands in the sierra region of the interior. The two forms were described as the same disease by Dr. Archibald Smith; but the fever of the sierras was afterwards shown to be a form of typhus, analogous to the native Mexican form, and quite unconnected with the yellow fever of the coast.

In the harbors of the American colonies (United States) the history of yellow fever has been as follows. It begins to be heard of at Charleston in 1693, and at Philadelphia the same year. The South Carolina port has the fullest record of it, next in order in the earlier period being Philadelphia, New York, and Norfolk (Va.). Towards the end of the 18th century the ports of New England, as far north as New Hampshire, have visitations, and it begins to be quite common at Baltimore, Wilmington, Savannah, and New Orleans. At a still later period (within the 19th century) we find the centre of incidence shifting so as to include Mobile, Memphis, Natchez, St. Francisville, and Baton Rouge; and in the most recent period outbreaks are recorded at Galveston and other ports of Texas, and at Pensacola, Vicksburg, and Key West. The Atlantic ports gradually lost it and the Gulf ports took up the inheritance, several of them keeping it still. Some of the epidemics were very disastrous, one of the Philadelphia outbreaks corresponding to the pestilence which figures in the last section of Longfellow's *Evangeline:* "Wealth had no power to bribe, nor beauty to charm the oppressor." In the New Orleans epidemic of 1878 the deaths numbered 4056. The American ports mentioned have been only its principal seats, many other smaller harbors having had outbreaks now and then, such as New Haven (Conn.), Providence (R.I.), Swedesborough (N. J.), Alexandria (Va.), Augusta (Ga.), St. Augustine (Fla.), Opelousas (La.), and Houston (Tex.).

Along with the harbors and anchorages of the West Indies and Spanish Main, the three chief harbors of Guiana (Cayenne, Surinam, and Demerara) have had an equal share, and for almost the same period. But for Brazilian ports there is no record of yellow fever until 1849, when it appeared for the first time at Rio de Janeiro, Bahia, and other places. These ports became epidemic seats of the infection from that year, and are now more distinctively the headquarters of the disease than its old West Indian and Mexi-

can Gulf centres. Monte Video had a disastrous epidemic in 1857, and Buenos Ayres a visitation in 1858; but the shipping places of the river Plate are not in the same class of endemic foci as the harbors of Brazil.

There have been a few epidemics at trading places on the West Coast of Africa, most of them subsequent to 1820, and all of them confined generally to white residents.

During the great period of yellow fever (1793–1805), and for some years afterwards, the disease found its way time after time to various ports of Spain. Cadiz, indeed, suffered five epidemics in the 18th century, Malaga one, and Lisbon one; but from 1800 down to 1821 the disease assumed much more alarming proportions, Cadiz being still its chief seat, while Seville, Malaga, Cartagena, Barcelona, Palma, Gibraltar, and other shipping places suffered severely, as well as some of the country districts nearest to the ports. These Spanish outbreaks were clearly connected with the arrival of ships, but for the most part there had not been cases of yellow fever on board the ships. The last severe epidemic on Spanish soil was at Barcelona in the summer of 1821, when 5000 persons died. The most recent disastrous epidemic in Europe was at Lisbon in 1857, when upwards of 6000 died in a few weeks. The outbreaks at St. Nazaire (1861), Leghorn, Swansea (1864), and Southampton have been carefully studied, but are otherwise of minor importance.

Special local and racial circumstances.

Yellow fever is dependent upon high summer temperature for its epidemic development, and it requires a good deal of heat to continue even after it has once acquired epidemic intensity. In its endemic centres in the New World it clings peculiarly to the lower quarters of the seaports, to the alluvial foreshores, and to the anchorages; on many occasions it has been prevalent among the crews of men-of-war and of merchantmen at anchor, or moored in the harbor, or lying up in the *carénage*, when there has been none of it among the residents ashore. It is admitted that the endemic influence which causes it is effluvial or miasmatic from the harbor mud, or from the bilge-water of a ship that had lain in the harbor, or from the alluvial foundations of houses nearest to the beach. So far as prevalence on shore is concerned, it seems to follow the same laws as cholera and typhoid fever: that is to say, it is an exogenous or soil infection, a fermentation of filth in the ground, with a seasonal activity closely following the movements of the subsoil water. In like manner, when it has been imported to Spain, it has clung to alluvial soil and has spread after the fashion of a soil-borne infection rather than by personal contagion, although in Spanish ports, just as in Philadelphia, according to Rush's opinion, contagiousness has been found to be "contingent" to it under certain circumstances. To establish an epidemic in a distant port, it has been necessary that there should be carried thither a material quantity of the specifically poisonous harbor-filth in a ship's bilges, and that the conditions favorable to its increase and diffusion by fermentation should exist in the new soil.

The next most significant thing in the incidence of this fever is that new arrivals at an indigenous centre are peculiarly liable to take it, and most liable of all the sailors and others from northern latitudes, such as Sweden, Finland, Holland, and Germany. In fact an epidemic outburst in a yellow-fever port or endemic centre at the present day is commonly connected with an unusual influx of strangers. It is not to be supposed, however, that the residents acquire immunity by acclimatization; they have no greater immunity in that sense than have the Bengalis from cholera, or than those who permanently reside in unsanitary localities from typhoid fever or diphtheria. The only immunity is that of the Negro race, an immunity all the more striking that the Negroes in yellow-fever ports are mostly found living in the favorite haunts of the disease, and that their race is peculiarly liable to all other infections of the kind, including cholera, typhus, and typhoid. Although the protection of the Negro of pure blood is not absolute, it is nearly so. In ordinary circumstances Negroes become liable when of mixed blood, and almost exactly in proportion to the degree of white stock in their breeding. These racial peculiarities have been so often remarked and are so universally admitted in their broad significance that no detailed proofs need be adduced. It may be stated however, that all African Negroes, whether fresh from Africa or long acclimatized to the New World, have the same natural protection; thus the Nubian regiment in the French service during the Mexican expedition did not lose a single man, and did not even have a single case, in the epidemic at Vera Cruz in 1866. The protection is profoundly racial, and not due to the Negroes being inured to yellow-fever localities. There is no other instance of the same racial immunity in the whole range of infective sickness.

Theory of the disease.

Two things stand out prominently in the foregoing recital of facts,—(1) that yellow fever, in time and place, has dogged the steps of the African slave trade, and (2) that the African negro has a very large racial immunity from yellow fever. The first of these facts was generalized by Audouard (Paris, 1825), but has been neglected and forgotten; the second fact, which no one seriously disputes, is the complement and confirmation of the historical and geographical induction. The circumstances in Peru, although apparently in contradiction, are really corroborative: a form of yellow fever established itself at certain ports of that country in the wake of a notorious Chinese coolie trade (see COOLIE, vol. vi. pp. 296–7); but the Chinese themselves were exempt from the fever at the time, and would appear not to have suffered from it in the subsequent epidemics on the Peruvian coast. The question thus arises as to the particular connection between the African slave trade (or the analogous Chinese coolie trade) and yellow fever. The first point is that the fever has not been a fever of the voyage but of the landing place, although there are several authentic instances (*e.g.*, cases of the "Regalia" and "La Pique") of yellow fever arising at sea from exposure of white men to the stench of a shipful of negroes. Again, the filthy condition of a Guineaman on her arrival from Africa was a notorious fact; and the filth of that kind was discharged into the ereeks, *carénages*, and anchorages of slave ports in material quantity year after year for a long period. At Havana as many as a hundred slavers would arrive in one year. Steady accretions of the filth of slave-ships from the beginning of the traffic to America down to its abolition in 1808, and its final cessation previous to 1860, would account for a peculiarly pestiferous state of the harbor mud, of the beach, and even of the water; in fact, the water in the Bay of Havana was pestiferous and full of organic matter where it was several fathoms deep, and there was a standing order in the British navy against admitting it into ships. Wherever the harbors were most tideless, as around the Gulf of Mexico and in the West Indian Islands, and wherever the soil was most alluvial, and movements of the ground-water most extensive, the specific putrefaction or fermentation thus introduced into the harbor would spread farthest on shore, being aided or encouraged always by the abundance of other organic matter which it met with at particular spots, such as the foundations of houses.

The next step is to consider the connection between this wholesale befouling of slave ports and the particular type of endemic disease. One of the points most emphasized by Audouard was the fundamental physiological differences between the African Negro race and the white. The discharges of the Negro body might become by their effluvia specifically poisonous, he argued, to white men under special circumstances. A more direct factor in the ætiology was the very common, if not uniform, prevalence of dysentery and diarrhœa in the passage from the Guinea coast to the western shores of the Atlantic: the filth in a slave-ship's bilges was, in part at least, dysenteric in its source and properties. Now, there is much independent evidence, collected from times of war and famine, to prove a certain correlation or equivalence between dysentery and typhus; according to Blane's phrase, the one was vicarious to the other. Yellow fever is admittedly a form of typhus, a form distinguished by a hæmorrhagic tendency. Thus we find the connection explained between dysenteric and other evacuations of the Negro race, carried to the mud and alluvial soil of ports under very peculiar circumstances, and a special form of endemic typhus, differing from the ordinary form in being earth-borne instead of air-borne. The remaining part of the synthesis concerns the differential type of yellow fever within the genus "typhus:" Whence did it obtain the "note" or distinctive mark, anatomical and clinical, of an acute yellow atrophy of the liver? The dysenteric filth that was imported into the harbors of the New World represented that almost unique unwholesomeness of life which is summed up in the phrase "horrors of the middle passage." Among such horrors nostalgia, despair, and the sense of wrong were not the least; and these are among the states of human feeling that have been known, now and then, in the ordinary way of life to assume that peculiar visceral embodiment, or to find that means of expression, which amounts to acute yellow atrophy of the liver, and stands, in fact, for a total arrest of the hepatic functions, biliary and other.

There is no other theory of yellow fever to contest the field with the slave-trade hypothesis; that alone satisfies all the conditions of a correct synthesis—historical, geographical, ethnological, physiological, and, some would say, even ethical. There have been various other theories put forward from time to time, all of them much too fragmentary, and therefore erroneous, such as the hypothesis

of rotting timber (in wharves, ships' hulls, etc.), of sugar cargoes, of common foul bilge-water, of madrepores, and of bacilli. The bacillary or parasitic hypothesis is the fashionable one at present, but it is much too ambitious, as ordinarily held, and altogether wide of the mark. The part played by putrefactive organisms is a subordinate one. In the general grouping of factors they can only come in after we have found the specific integral of the yellow-fever soil in its endemic seats; they cannot elaborate the miasmatic poison of yellow fever without a definite pabulum, any more than the "lactic bacillus" can produce lactic fermentation without milk-sugar.

Sanitation.

The sanitary or public health aspects of yellow fever have been discussed in great part under QUARANTINE (vol. xx. pp. 162–3). In regard to its sanitation at the endemic seats in the West Indies, Guiana, Brazil, Central America, and the Gulf States of the American Union, the same principles apply as to other filth diseases. The object is to secure a clean soil, and to that end drainage and sewerage serve best. In the sanitation of yellow fever the case is so far peculiar that the harbor bottom, the adjoining mudbanks and mangrove swamps, and even the seawater itself, are apt to retain the specific taint, especially where the cleansing action of the tides is slight. But there is good reason to think that the specific taint in the soil is everywhere slowly disappearing, now that it is no longer reinforced by fresh supplies year after year. It has practically vanished from the Atlantic ports of the United States, and has become almost rare in such harbors as Port Royal, Jamaica. Its headquarters are now the Brazilian ports, which were the last to develop it (in 1849).

Literature.—The chief work is that of La Roche, *Yellow Fever*, 2 vols., Philadelphia, 1855. A very full bibliography is given by Hirsch at the end of his section on "Yellow Fever," in *Historisch-Geographische Pathologie*, vol. i., Stuttgart, 1881 (Engl. transl. by Creighton, London, 1883). Recent experience, epidemiological and clinical, is given in the writings (2 vols.) of Dr. Joseph Jones of New Orleans, 1887; see also Maclean's *Diseases of Tropical Climates*, London, 1886. Among the numerous monographs may be specially mentioned those of Pym (*Observations upon the Bulam Fever*, London, 1815), who showed that one attack gave immunity, and of Daniel Blair (*Some Account of the Last Yellow Fever Epidemic of British Guiana*, with plates, 3d ed., London, 1852). A popular exposition of the slave-trade hypothesis of Audouard (with additions by the writer of the present article) will be found in *North. Amer. Rev.*, October, 1884. Audouard's three papers were collected under the title *Recueil de Mémoires sur le Typhus Nautique, ou Fièvre Jaune*, Paris, 1825. (C. C.)

YELLOW RIVER. See CHINA, vol. v. pp. 547–8.

YELLOWSTONE NATIONAL PARK, an area situated mainly in northwestern Wyoming, United States, which has been withdrawn from settlement by the United States Government and dedicated to the purposes of a public park. It is a region of hot springs and geysers, mountains and cañons, lakes and waterfalls. While it is almost entirely comprised in Wyoming, a narrow strip 2 miles wide projects on the north into Montana, and on the west a strip about 5 miles in width projects into the same Territory and into Idaho. Its boundaries, which were defined at a time when the country was but little known, are as follows: The northern boundary is a parallel of latitude running through the mouth of Gardiner river, a branch of the Yellowstone, 2 miles north of 45° N. The eastern boundary is a meridian 10 miles east of the most easterly point of Yellowstone Lake, which places it almost on the 110th meridian. The southern boundary is a parallel 10 miles south of the most southerly portion of the same body of water, in lat. 44° 10′ N. The western boundary is a meridian 15 miles west of the most westerly portion of Madison (now Shoshone) Lake, this meridian being approximately that of 111° 6′. The Park is therefore very nearly a rectangle in shape, its length north and south being 61.8 miles and its breadth 53.6. Its area is 3312 square miles.

Its surface is mainly an undulating plateau, with a mean elevation above the sea of about 8000 feet, upon the surface of which the minor streams flow, while the larger ones have cut cañons for themselves, several of them being of great depth. The eastern portion, however, is occupied by an extremely rugged mountain chain, known as the Absaroka Range, peaks of which rise to heights exceeding 11,000 feet. These mountains, which separate the waters of the Yellowstone from those of the Big Horn, are unsurpassed in the United States for sublimity and grandeur of scenery. The Gallatin Range, which separates the Yellowstone from the Gallatin river, enters the Park near the northwestern corner and extends southwards some 20 miles within it. It reaches its culminating point in Electric Peak, 11,050 feet high, just within the Park boundary. Another group of mountains, in the form of a horseshoe, occurs near the middle of the Park, known as the Washburne Mountains, the highest summit of which, Mount Washburne, has an elevation of 10,346 feet. The Red Mountains are in the southern part, their culminating peak being Mount Sheridan, 10,385 feet in height. In this part of the Park the plateau is more elevated and broken, and just beyond its southern limits it rises into a confused maze of mountains.

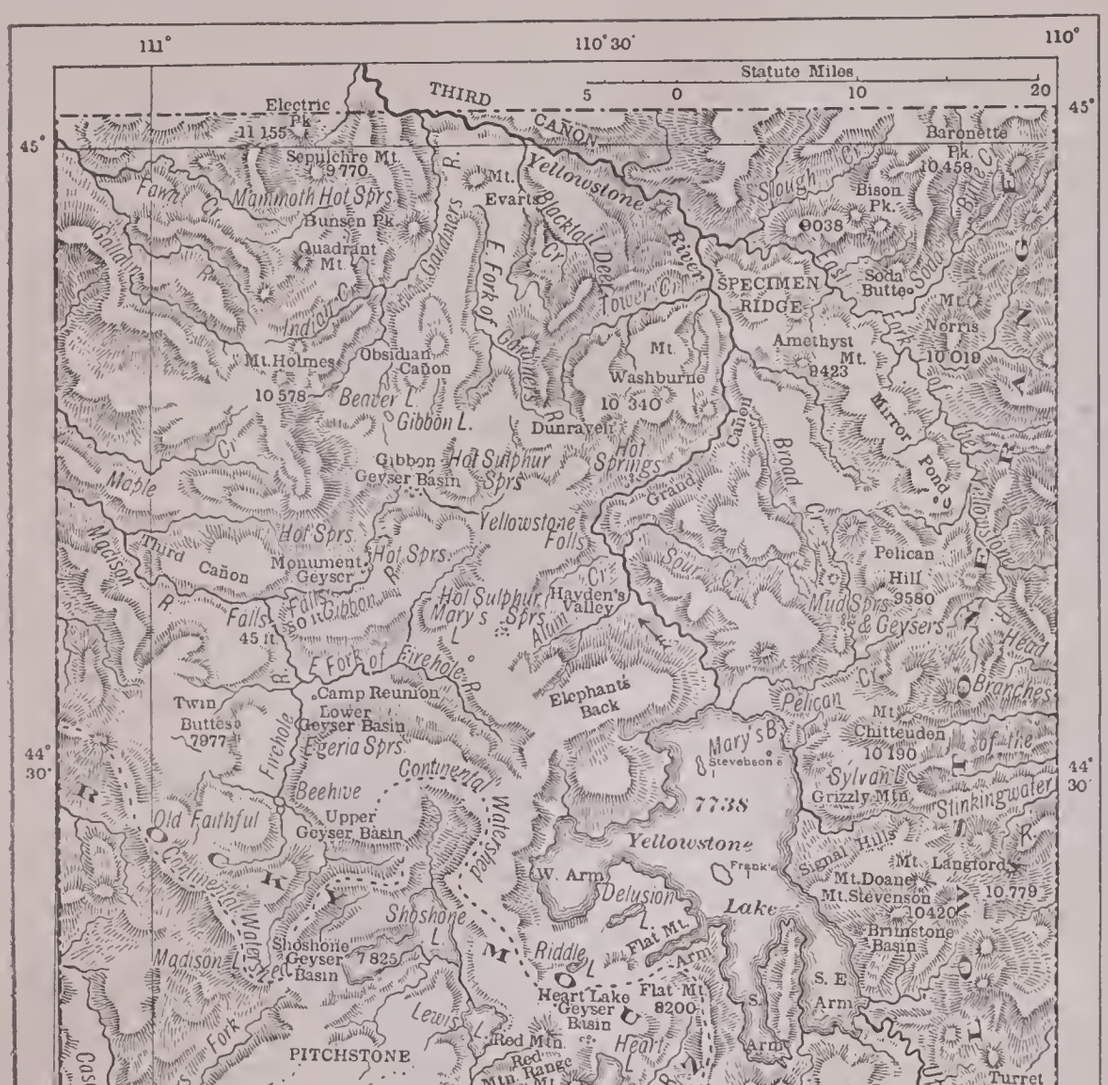
The Park has an abundant rainfall, and its streams are numerous and bold. It contains many beautiful lakes and ponds. Within its area are the sources of the Yellowstone and the Madison, which go to make up the Missouri, and of the Snake, one of the forks of the Columbia. This last stream, which drains the southwestern part, takes its rise in several branches, among them being Lewis Fork, which has its origin in the beautiful Shoshone Lake, and Heart river, which rises in Heart Lake, under the shadow of Mount Sheridan. The Yellowstone drains the eastern part. Rising just beyond its southern limits, it flows into and through Yellowstone Lake, a magnificent sheet of water, of very irregular shape, having an area of 150 square miles.[1] A few miles below the lake, the river, after a succession of rapids, leaps over a cliff, making the Upper Fall, 112 feet in height. Half a mile lower down it rolls over the Lower Fall, which has a clear descent of 300 feet. The river at this point carries, at the average stage of water, about 1200 cubic feet per second. With this fall the river enters the Grand Cañon, which in many scenic effects has not its equal on the globe. Its depth is not great, at least as compared with the cañons upon the Colorado river system, ranging from 600 feet at its head to 1200 near the middle, where it passes the Washburne Mountains. Its length to the mouth of Lamar river is 24 miles. It is cut in a volcanic plateau, and its ragged broken walls, which are inclined at very steep angles, are of a barbaric richness of coloring that almost defies description. Reds, yellows, and purples predominate, and are set off very effectively against the dark green of the forests upon the plateau, and the white foam of the rushing river which fills the bottom of the chasm. Near the foot of the Grand Cañon, Tower creek, which drains the concavity of the horseshoe formed by the Washburne Mountains, enters the Yellowstone. Just above its mouth this stream makes a beautiful fall of 132 feet into the gorge in which it joins the river. A few miles farther down the Yellowstone is joined by an eastern branch, Lamar river, which drains a large part of the Absaroka Range. Then it enters the Third Cañon, from which it emerges at the mouth of Gardiner river. The latter stream drains an area of elevated land by means of its three forks, and upon each of them occurs a fine fall in its descent towards the Yellowstone. The Madison rises in the western part of the Park and flows in a generally northward and then westward course out of the Park. Its waters are mainly collected from the rainfall upon the plateaus, and from the hot springs and geysers, most of which are within its drainage area. Upon this river and its affluents are several fine falls. Indeed all the streams of this region show evidence, in the character of their courses, of a recent change of level in the surface of the country.

The climate is characterized by a considerable degree of humidity and a heavy rainfall, as compared with adjacent portions of the West. The temperature is that of a semi-

[1] [The lake has an elevation of 7790 feet above the sea.—AM. ED.]

arctic region. Frost may occur in midsummer and snow begins to fall in September.

The native fauna is abundant and varied. The policy of the Government, which protects game within this reservation, has induced it to take shelter here against the sportsman and pot-hunter, so that elk, deer, antelope, mountain sheep, bear, and numerous smaller game animals are very



Yellowstone National Park.

abundant and tame. The only herd of wild bisons left in the United States is upon this reservation; and in some parts moose are occasionally seen.

The flora is very varied. With the exception of a few limited areas in the northern part, the region is covered with forests, generally so dense that landmarks are invisible and the traveller is forced to guide himself by the sun or by compass. The trees are mainly the Douglas spruce and the yellow pine, and are not of large size or great commercial value.

The surface of the park is almost entirely covered with volcanic rocks. The Gallatin Range, however, in the northwestern corner, is made up of stratified beds ranging from the Silurian system up to the Cretaceous. In a few localities also Tertiary lake beds and local drift are found. The plateaus generally are composed of rhyolite, while the mountain ranges are made up of later volcanic deposits, mainly conglomerates. In this region the ancient volcanic fires, which formerly extended far and wide, especially to the south and west, are still in existence, as is shown by the vast numbers of hot springs and geysers. The number of the former is by a close estimate not less than 3000, varying in size from a few inches in diameter to an area of many acres. The number of active geysers is 71. These phenomena are found in groups in numerous localities, the most important of which—for they contain most of the great geysers—are the Upper and the Lower Geyser basins, near the head of the Madison, here known as the Firehole river. The former contains 26 geysers, several of which are of such power as to throw water to heights exceeding 200 feet, and the amount of water thrown out is so great as to raise the temperature of the river water many degrees. The Lower basin contains 16 geysers. The Norris basin, upon Gibbon river, a branch of the Madison, contains 9 geysers, and the Shoshone basin, upon the shore of Shoshone Lake, contains 8 active spouters. Others are found at Heart Lake, upon Pelican creek, in Hayden's valley, and in Monument basin. In all these localities the water holds silica in solution in considerable quantities, so that as it cools and evaporates it deposits siliceous matter, which has covered with a hard white floor many square miles of these valleys, and has built up craters around the springs and geysers of considerable size and great beauty of form. Besides silica, the water of many of the springs contains sulphur, iron, alum, and other materials in solution, which in places stain the pure white of the siliceous deposits with bright bands of color. Upon Gardiner river, near the northern boundary of the Park, there is a large group of springs, known as the Mammoth Hot Springs, which differ from the others in holding carbonate of lime in solution. These springs have deposited so freely as to build up a hill 200 feet in height, from the top of which the springs boil out. The slopes of this mound have been built in the form of a succession of basins rising one above another, and the water from the springs overflows from one into another, growing gradually cooler as it descends. Upon the bank of the Yellowstone river, between the falls and the lake, there was, when the region was first explored, a geyser which at intervals of about 4 hours threw up a column of mud to a height of 40 or 50 feet. In more recent times this geyser has ceased action. These phenomena have been under observation since 1871; and, while there have been changes in them, certain geysers having ceased and others having been formed, no evidence of a diminution of power has been observed.

The Park is accessible by means of the Northern Pacific Railroad, by a branch which extends up the valley of the Yellowstone within a few miles of the northern boundary; and with this a line of stage coaches is connected.

The most stringent laws have been enacted in regard to the killing of game, the starting of forest fires, and the removal of the deposits of the springs.

Although exploring parties had at various times passed on all sides of this strange region, its wonders remained undiscovered until so late a period as 1870. This fact is all the more remarkable because at that time the frontier of

settlement was in the Gallatin valley, not a hundred miles from the great geyser region. Some rumors of hot springs and geysers, coming from stray trappers and Indians had been received, however, and these were sufficient to start a party from the Montana settlements in 1870, to investigate the strange tales. The discoveries made by this, the Washburne party, induced Dr. F. V. Hayden, then in charge of a Government survey, to turn his explorations in this direction. The reports brought back by him induced Congress to reserve this area from settlement, which was done in the spring of 1872. In that year further explorations were made, and in subsequent years army expeditions carried the work of exploration still farther. In 1878 a map of the Park, based upon triangulation, was drawn up by the Hayden survey, and in 1883–1885 a more detailed map was made by the United States Geological Survey, and a systematic study of its geological phenomena was instituted. (H. G*.)

YELLOW-TAIL. This name is given by seafaring men to a variety of marine fishes, chiefly of the family of Horse-Mackerels, which have this in common, that they are edible and have a yellow caudal fin. As the latter peculiarity, which has found expression in the specific names of *chrysurus*, *xanthurus*, etc., of systematic ichthyology, is not confined to that family, very different kinds of fishes bear the same name: thus, for instance, the fishermen of the United States apply it to a species of the Meagre family (*Sciænidæ*) and to others. Economically the most important kinds of these fishes, the yellow-tail of the South Atlantic and the southern Indo-Pacific Ocean, are species of the genera *Seriola*, *Seriolichthys*, and *Micropteryx*, some of which, like *Seriola lalandii* and *S. gigas*, attain to the size of a cod or a coal-fish, and are preserved in a similar manner, either salted or dried. They abound in many localities, and are valued as food fish everywhere. They form a large proportion of the dried fish which are exported from the Cape of Good Hope to Mauritius and Batavia, or are sold to the whalers visiting the Southern Ocean. They are equally abundant at St. Helena, where, however, their value as an article of trade does not seem to be fully understood. On the coasts of South Australia and New Zealand they are likewise a staple article of food, but are chiefly eaten fresh, the most esteemed species being *Seriola lalandii*, also known to the colonists as the "king-fish."

YEMEN, in Arabia, literally the land "on the right hand" of one who faces east, meant originally all the land southwards from Syria (Shám). The Arabia Felix (*εὐδαίμων*) of Ptolemy and other ancients is a mistranslation, the right hand being taken to mean "lucky" (*δεξιός*, *dexter*). Arabia Felix included all Arabia except the peninsula of Sinai (Arabia Petræa) and the Syrian desert (Arabia Deserta): *i.e.*, it took in the Ḥijáz and Nejd as well as South Arabia. The Arabs use the term Yemen in various extensions. A tradition of the Prophet makes Yemen and Shám meet at Tabbák; but Abú 'Abbás already confines the name to all Arabia south of Mecca. This usage, which excludes Nejd and Ḥijáz from Yemen, is not merely that of Moslem geographers, who take Mecca as their imaginary standpoint, but is found in the heathen poets. When Imraolḳais speaks of a Yemenite trader, Ṭarafa, of tanned ox-hides from Yemen, Labíd of a youth from Yemen who knew letters, or a poet of Hodhail of the excellent work of a Yemenite smith, they all mean by Yemen the southern region where trade, letters, and industry had their early home in the peninsula. The northern boundary of Yemen is variously laid down. Al-Asma'í makes it a line drawn obliquely from 'Omán to Nejrán; but Hamdání rightly draws it farther north, from 'Omán and Yebrín in the south of Yemáma by way of Al-Ḥujaira, Tathlíth, and Jorash to Kodommol (Kotumble of the Admiralty chart, in lat. 17° 52′). In its narrowest limitation Yemen comprises, not the whole south of the peninsula, but only the southwest as far as Ḥaḍramaut, which was viewed as a dependency of Yemen. The physical conformation of the southwestern portion of the peninsula differs greatly from that of Arabia proper, being similar to that of Ethiopia. A range of mountains, which rises into peaks of considerable elevation, and descends with a steep slope towards the shore of the Red Sea, stretches from the southern extremity northwards as far as Ṭáif. This range is pierced by several streams and wadies, which flow into the Red Sea.[1] In old times the region cannot of course have been called "the Southland" by its own inhabitants.

Sabæans.—The ancient name of the people of Yemen was Saba (Saba' with final *hemza*); and the oldest notices of them are in the Hebrew Scriptures. The list of the sons of Joktan in Gen. x. 26–29 contains in genealogical form a record of peoples of South Arabia which must rest on good information from Yemen itself. Many of these names are found on the inscriptions or in the Arabic geographers,—Sheba (Saba'), Hazarmaveth (Ḥaḍramaut), Abimael (Abime'athtar),

Map of Yemen.

Jobab (Yuhaibib, according to Halévy), Jerah (Waráh of the geographers). Joktan (Arab Ḳaḥtan; *waḳata* = *ḳaḥata*). On the other hand, the names of some famous nations mentioned on the inscriptions are lacking, from which it may be concluded that they did not rise to prominence till a later date. Saba' (Sheba) itself, which was in later times the chief name, has in Gen. x. 28 a subordinate place; it was perhaps only a collective name for the companies of merchants who conducted the South-Arabian export trade (the root *saba'* in the inscriptions meaning to make a trading journey), and in that case would be of such late origin as to hold one of the last places in a list that has genealogical form. Two other accounts in Genesis, originally independent, give supplementary information drawn from the Sabæan colonies, the stations and factories established to facilitate trade through the desert. The inscriptions of Al-'Ola published by D. H. Müller show that there were Minæan colonies in North Arabia. Other South Arabs, and especially the Sabæans, doubtless also planted settlers on the northern trade routes, who in process of time united into one community with their North-Arab kinsmen and neighbors. Thus we can understand how in Gen. xxv. 2–3 Sheba and Dedan appear among the North-Arab "sons of Keturah." Again the Sabæans had colonies in Africa and

[1] An excellent topographical description of Yemen is given in Hamdání's *Geogr. d. Arab. Halbinsel*, ed. D. H. Müller (1884).

there mingled with the black Africans; and so in Gen. x. 7 Sheba and Dedan, the sons of Raamah (Raghma), appear in the genealogy of the Cushites. With the Ethiopians *Saba'* means "men," a clear indication of their Sabæan descent.

The queen of Sheba who visited Solomon may have come with a caravan trading to Gaza, to see the great king whose ships plied on the Red Sea. The other Biblical books do not mention the Sabæans except incidentally, in allusion to their trade in incense and perfumes, gold and precious stones, ivory, ebony, and costly garments (Jer. vi. 20; Ezek. xxvii. 15, 20, 22 *sq.*; Isa. lx. 6; Job vi. 19). These passages attest the wealth and trading importance of Saba from the days of Solomon to those of Cyrus. When the prologue to Job speaks of plundering Sabæans (and Chaldæans) on the northern skirts of Arabia, these may be either colonists or caravans, which, like the old Phœnician and Greek traders, combined on occasion robbery with trade. The prologue may not be historical; but it is to be presumed that it deals with historical possibilities, and is good evidence thus far.

The Biblical picture of the Sabæan kingdom is confirmed and supplemented by the Assyrian inscriptions. Tiglath Pileser II. (733 B.C.) tells us that Teima, Saba', and Ḥaipá (= Ephah, Gen. xxv. 4 and Isa. lx. 6) paid him tribute of gold, silver, and much incense. Similarly Sargon (715 B.C.) in his *Annals* mentions the tribute of Shamsi, queen of Arabia, and of Itamara of the land of Saba',—gold and fragrant spices, horses and camels.

The earliest Greek accounts of the Sabæans and other South-Arabian peoples are of the 3d century B.C. Eratosthenes (276–194 B.C.) in Strabo (xv. 4, 2) says that the extreme south of Arabia, over against Ethiopia, is inhabited by four great nations,—the Minæans (Μινναῖοι, Μηναῖοι; Ma'ín of the inscriptions) on the Red Sea, whose chief city is Carna; next to them the Sabæans, whose capital is Mariaba (Mariab of the inscriptions); then the Catabanes (Katabán of the inscriptions), near the Straits of Báb-al-Mandeb, the seat of whose king is Tamna; fourthly, and farthest east, the people of Ḥadramaut (Chatramotitæ), with their city Sabota. The Catabanes produce frankincense and Ḥadramaut myrrh, and there is a trade in these and other spices with merchants who make the journey from Ælana (Elath, on the Gulf of 'Akaba) to Minæa in seventy days; the Gabæans (the Gaba'án of the inscriptions, Pliny's Gebanitæ) take forty days to go to Ḥadramaut. This short but important and well-informed notice is followed a little later by that of Agatharchides (120 B.C.), who speaks in glowing terms of the wealth and greatness of the Sabæans, but seems to have less exact information than Eratosthenes. He knows only the Sabæans and thinks that Saba is the name of their capital. He mentions, however, the "happy islands" beyond the straits, the station of the Indian trade (§ 103). Artemidorus (100 B.C.), quoted by Strabo, gives a similar account of the Sabæans and their capital Mariaba, of their wealth and trade, adding the characteristic feature that each tribe receives the wares and passes them on to its neighbors as far as Syria and Mesopotamia.

The accounts of the wealth of the Sabæans brought back by traders and travellers excited the cupidity of Rome, and Augustus entrusted Ælius Gallus with an expedition to South Arabia, of which we have an authentic account in Strabo (xvi. 4, 22). He hoped for assistance from the friendly NABATÆANS (*q.v.*); but, as they owed everything to their position as middlemen for the South Arabian trade, which a direct communication between Rome and the Sabæans would have ruined, their viceroy Syllæus, who did not dare openly to refuse help, sought to frustrate the emperor's scheme by craft. Instead of showing the Romans the caravan route, he induced them to sail from Cleopatris to Leucocome, and then led them by a circuitous way through waterless regions, so that they reached South Arabia too much weakened to effect anything. But the expedition brought back a considerable knowledge of the country and its products, and the Roman leader seems to have perceived that the best entrance to South Arabia was from the havens on the coast. So at least we may conclude when, a hundred years later (77 A.D., as Dillmann has shown), in the *Periplus* of an anonymous contemporary of Pliny (§ 23) we read that Charibael of Ẓafar, "the legitimate sovereign of two nations, the Homerites and Sabæans," maintained friendly relations with Rome by frequent embassies and gifts. Pliny's account of Yemen, too, must be largely drawn from the expedition of Gallus, though he also used itineraries of travellers to India, like the *Periplus Maris Erythræi* just quoted.

Nautical improvements, and the discovery that the southwest monsoon (Hippalus) gave sure navigation at certain seasons, increased the connection of the West with South Arabia, but also wrought such a change in the trade as involved a revolution in the state of that country. The hegemony of the Sabæans now yields to that of a new people, the Homerites or Himyar, and the king henceforth bears the title "king of the Himyarites and Sabæans." Naval expeditions from Berenice and Myoshormus to the Arabian ports brought back the information on which Claudius Ptolemy constructed his map, which still surprises us by its wealth of geographical names.

Sabæan colonies in Africa have been already mentioned. That Abyssinia was peopled from South Arabia is proved by its language and writing; but the difference between the two languages is such as to imply that the settlement was very early and that there were many centuries of separation, during which the Abyssinians were exposed to foreign influences. New colonies, however, seem to have followed from time to time, and, according to the *Periplus* (§ 16), some parts of the African coast were under the suzerainty of the Sabæan kings as late as the Sabæo-Himyaritic period; the district of Azania was held for the Sabæan monarch by the governor of Maphoritis (Ma'áfir), and was exploited by a Sabæan company. Naturally difficulties would arise between Abyssinia and the Sabæan power. In the inscription of Adulis (2d century) the king of Ethiopia claims to have made war in Arabia from Leucocome to the land of the Sabæan king. And the Ethiopians were not without successes, for on the Greek inscription of Aksúm (*c.* the middle of the 4th century) king Æizanes calls himself "king of the Aksumites, the Homerites, and Raidán, and of the Ethiopians, Sabæans, and Silee." More serious was the conflict under Dhú-Nu'ás (Dhú-Nuwás of the Arab historians) in the beginning of the 6th century; it ended in the overthrow of the Himyarite king and the subjugation of Yemen, which was governed by a deputy of the Aksumite king, till (about 570) the conquerors were overthrown by a small band of Persian adventurers (see PERSIA, vol. xviii., pp. 624–6).

With the exception of what the South Arabian Hamdání relates of his own observation or from authentic tradition, the Mohammedan Arabic accounts of South Arabia and Sabæa are of little worth. The great event they dwell on is the bursting of the dam of Ma'rib, which led to the emigration northwards of the Yemenite tribes. We may be sure that this event was not the cause but the consequence of the decline of the country. When the inland trade fell away and the traffic of the coast towns took the sea route, the ancient metropolis and the numerous inland emporia came to ruin, while the many colonies in the north were broken up and their population dispersed. To this the Koran alludes in its oracular style, when it speaks (xxxiv. 17) of well-known cities which God appointed as trading stations between the Sabæans and the cities he had blessed (Egypt and Syria), and which He destroyed because of their sins.

Inscriptions.—This abstract of the history of Yemen from

ancient sources can now be verified and supplemented from inscriptions. Doubts as to the greatness and importance of the Sabæan state, as attested by the ancients, and as to the existence of a special Sabæan writing, called "Musnad," of which the Arabs tell, were still current when Niebuhr, in the 18th century, brought to Europe the first account of the existence of ancient inscriptions (not seen by himself) in the neighborhood of Yarím. Following this hint, Seetzen, in 1810, was able to send to Europe, from porphyry blocks near Yarím, the first copies of Sabæan inscriptions. They could not, however, be read. But the inscriptions found by Wellsted in 1834 at Ḥiṣn Ghoráb were deciphered by Gesenius and Rödiger. Soon after this the courageous explorer Arnaud discovered the ancient Mariab, the royal city of the Sabæans, and at great risk copied fifty-six inscriptions and took a plan of the walls, the dam, and the temple to the east of the city. These, with other inscriptions on stone and on bronze plates brought home by Englishmen, found a cautious and sound interpreter in Osiander. The historical and geographical researches of Kremer and Sprenger gave a fresh impulse to inquiry. Then Joseph Halévy made his remarkable journey through the Jauf, visiting districts and ruins which no European foot had trod since the expedition of Gallus, and returned with almost 800 inscriptions. Of more recent travellers S. Langer and E. Glaser have done most for epigraphy, while Manzoni is to be remembered for his excellent geographical work.

The *alphabet* of the Sabæan inscriptions is most closely akin to the Ethiopic, but is purely consonantal, without the modifications in the consonantal forms which Ethiopic has devised to express vowels. There are twenty-nine letters, one more than in Arabic, *Samech* and *Sin* being distinct forms, as in Hebrew. This alphabet, which is probably the parent of the South-Indian character, is undoubtedly derived from the so-called Phœnician alphabet, the connecting link being the forms of the Ṣafa inscriptions and of the Thamudæan inscriptions found by Doughty and Euting. Of the latter we can determine twenty-six characters, while a twenty-seventh, probably corresponds to Arabic ظ (ظ). A sign for ض also probably existed, but does not occur in the known inscriptions. In the Thamudæan and Sabæan alphabets the twenty-two original Phœnician characters are mostly similar, and so are the differentiated forms for ع and خ, while ث, ذ, and probably also ظ and ض, have been differentiated in different ways. This seems to imply that the two alphabets had a common history up to a certain point, but parted company before they were fully developed. The Thamudæan inscriptions are locally nearer to Phœnicia, and the letters are more like the Phœnician; this character therefore appears to be the link connecting Phœnician with Sabæan writing. It may be noticed that a Thamudæan legend has been found on a Babylonian cylinder of about 1000 B.C., and it is remarkable that the Sabæan *saṭara*, "write," seems to be borrowed from Assyrian *shaṭáru*.

The *language* of the inscriptions is South Semitic, forming a link between the North Arabic and the Ethiopic, but is much nearer the former than the latter. To the details already given in the article SEMITIC LANGUAGES (vol. xxi. pp. 685–6 *sq.*) it may be added that of the two dialects commonly called Sabæan and Minæan the latter might be better called Hadramitic, inasmuch as it is the dialect of the inscriptions found in Ḥaḍramaut, and the Minæans seem undoubtedly to have entered the Jauf from Ḥaḍramaut.

The inscriptions not only give names of nations corresponding to those in the Bible and in classical authors but throw a good deal of fresh light on the political history of Yemen. The inscriptions and coins give the names of more than forty-five Sabæan kings. The chronology is still vague, since only a few very late inscriptions are dated by an era and the era itself is not certain. But the rulers named can be assigned to three periods, according as they bear the title "mukrab of Saba," "king of Saba," or "king of Saba and Raidán." The last, as we know from the Aksum inscriptions, are the latest, and those with the title "mukrab" must be the earliest. Four princes of the oldest period bear the name Yatha'amar, and one of these may, with the greatest probability, be held to be the "Itamara Sabai" who paid tribute to Sargon of Assyria. This helps us to the age of some buildings also. The famous dam of Ma'rib and its sluices were the work of this ancient prince—structures which Arnaud in the 19th century found in the same state in which Hamdání saw them a thousand years ago. The power of these old sovereigns extended far beyond Ma'rib, for their names are found on buildings and monuments in the Jauf.

We cannot tell when the kings took the place of the mukrab, but the Sabæo-Himyaritic period seems to begin with, or a little after, the expedition of Ælius Gallus. A fragmentary inscription of Ma'rib (Br. Mus., 33) was made by "Ilsharḥ, Yaḥdib and Ya'zil Bayyin, the two kings of Saba and Raidán, sons of Far'm Yanhab, king of Saba." If this Ilsharh is identical with the Ἰλάσσαρος of Strabo, king of Mariaba at the time of the Roman invasion, the inscription preserves a trace of the influence of that event on the union of the two kingdoms.

The inscriptions of the latest period present a series of dates—669, 640, 582, 573, 385—of an unknown era. Reinaud thought of the Seleucid era, which is not impossible; but Halévy observes that the fortress of Mawiyyat (now Ḥiṣn Ghoráb) bears the date 640, and it is said to have been erected "when the Abyssinians overran the country and destroyed the king of Ḥimyar and his princes." Referring this to the death of Dhú Nuwás (525 A.D.), Halévy fixes 115 B.C. as the epoch of the Sabæan era. This ingenious combination accords well with the circumstance that the oldest dated inscription, of the year 385 (270 A.D.), mentions 'Athtar, Shams, and other heathen deities, while the inscriptions of 582 (467 A.D.) and 573 (458 A.D.), so far as they can be read, contain no name of a heathen god, but do speak of a god Raḥmánán—that is, the Hebrew Raḥmán, "the compassionate" (Arabic, Al-Raḥmán), agreeably with the fact that Jewish and Christian influences were powerful in Arabia in the 4th century. The only objections to Halévy's hypothesis are (1) that we know nothing of an epoch-making event in 115 B.C., and (2) that it is a little remarkable that the latest dated inscription, of the year 669 (554 A.D.), should be twenty-five years later than the Abyssinian conquest. An inscription found by Wrede at 'Obne is dated "in the year 120 of the Lion in Heaven," which we must leave the astronomers to explain.

The inscriptions throw considerable light not only on the Sabæans but on other South-Arabian nations. The Minæans, whose importance has been already indicated, appear in the inscriptions as only second to the Sabæans, and with details which have put an end to much guesswork, *e.g.*, to the idea that they are connected with Miná near Mecca. Their capital, Ma'ín, lay in the heart of the Sabæan country, forming a sort of enclave on the right hand of the road that leads northward from Ma'rib. Southwest of Ma'ín, on the west of the mountain range, and commanding the road from San'a to the north, lies Baráḳísh, anciently Yathil, which the inscriptions and Arabic geographers always mention with Ma'ín. The third Minæan fortress, probably identical with the Κάρνα of the Greeks, lies in the middle of the northern Jauf, and north of the other two. The three Minæan citadels lie nearly in this position (.˙.), with old Sabæan settlements (Raiam) all round them, and even with some Sabæan places (*e.g.*, Nask and Kamná) within the triangle they form. The dialect of the Minæans is sharply distinguished from the Sabæans (see above). The inscriptions have yielded the names of twenty-seven Minæan kings, who were quite independent, and, as it would seem, not always friends of the Sabæans, for neither dynasty mentions the other on its inscriptions, while minor kings and kingdoms are freely mentioned by both, presumably when they stood under the protection of the one or the other respectively. The Minæans were evidently active rivals of the Sabæan influence, and a war between the two is once mentioned. In Ḥaḍramaut they disputed the hegemony with one another, the government there being at one time under a Minæan, at another under a Sabæan prince, while the language shows now the one and now the other influence. The religions also of the two powers present many points of agreement, with some notable differences. Thus, puzzling as the fact appears, it is clear that the Minæans formed a sort of political and linguistic island in the Sabæan country. The origin of the Minæans from Ḥaḍramaut is rendered probable by the predominance of their dialect in the inscriptions of that country (except in that of Ḥiṣn Ghoráb), by the rule, already mentioned, of a Minæan prince in Ḥaḍramaut, and by Pliny's statement (*H.N.*, xii. 63) that frankincense was collected at Sabota (the capital of Ḥaḍramaut; inscr. שבות), but exported only through the Gebanites, whose kings received custom dues on it, compared with xii. 69, where he speaks of Minæan myrrh "in qua et Atramitica est et Gebbanitica et Ausaritis Gebbanitarum regno," etc., implying that Minæan myrrh was really a Hadramite and Gebanite product. All this suggests a close connection between the Minæans and Ḥaḍramaut; and from the Minæan inscriptions we know that the Gebanites were at one time a Minæan race, and stood in high favor with the queen of Ma'ín. Thus we are led to conclude that the Minæans were a Hadramite settlement in the Jauf, whose object was to secure the northern trade road for their products. We cannot but see that their fortified posts in the north of the Sabæan kingdom had a strategical purpose; and so Pliny (xii. 54) says, "Attingunt et Minæi, pagus alius, per quos evehitur *uno tramite angusto* [from Ḥaḍramaut]. Hi primi commercium turis fecere maximeque exercent, a quibus et

Minæum dictum est." Besides this road, they had the sea-route, for, according to Pliny, their allies, the Gebanites, held the port of Oeelis. If the Minæans were later immigrants from Ḥaḍramaut, we can understand how they are not mentioned in Gen. x. In later times, as is proved by the Minæan colony in Al-'Olá, which Euting has revealed to us, they superseded the Sabæans in some parts of the north. In the 'Olá inscriptions we read the names of Minæan kings and gods. Notable also is the mention in 1 Chron. iv. 41 of the "Bedouin encampments (אהלים) and the Ma'ínim" smitten by the Simeonites, which may possibly refer to the destruction of a Minæan caravan protected by these Bedouins. The LXX. at least renders Ma'ínim by Μιναίους. It seems bold to conjecture that the Minæans were in accord with the Romans under Ælius Gallus, yet it is noteworthy that no Minæan town is named among the cities which that general destroyed, though ruin fell on Nask and Kamna, which lie inside the Minæan territory.

The inscriptions seem to indicate that the monarchies of South Arabia were hereditary, the son generally following the father, though not seldom the brother of the deceased came between, apparently on the principle of seniority, which we find also in North Arabia. Eratosthenes (in Strabo xvi. 4, 3) says that the first child born to one of the magnates after a king came to the throne was his designated successor; the wives of the magnates who were pregnant at the king's accession were carefully watched and the first child born was brought up as heir to the kingdom. There seems to be a mistake in the first part of this statement; what Eratosthenes will have said is that the oldest prince after the king was the designated successor. This law of succession explains how we repeatedly find two kings named together among the Sabæans, and almost always find two among the Minæans; the second king is the heir. The principle of seniority, as we know from North-Arabian history, gives rise to intrigues and palace revolutions, and was probably often violated in favor of the direct heir. On the other hand, it readily leads to a limited power of election by the magnates, and in fact good Arabian sources speak of seven electoral princes. Some inscriptions name, besides the king, an eponymus, whose office seems to have been priestly, his titles being *dhú ḥarif*, *eponymus*, and *rashúw*, "sacrificer." All royal inscriptions are signed by him at the beginning and the end, and he appears with the king on coins.

Religion.—In spite of the many ruins of temples and inscriptions, the religion of the Sabæans is obscure. Most of the many names of gods are mere names that appear and vanish again in particular districts and temples. Of the great national gods of the Sabæans and Minæans we know a little more. The worship of the heavenly bodies, for which there is Arabic evidence, had really a great place in Yemen. Sun-worship seems to have been peculiar to the Sabæans and Hamdanites; and, if the Sabis of Sabota (Pliny) was in fact the sun deity Shams, this must be ascribed to Sabæan influence. The Sabæan Shams was a goddess, while the chief divinity of the Minæans was the god 'Athtar, a male figure, worshipped under several forms, of which the commonest are the Eastern 'Athtar and 'Athtar Dhú Kabd. Wadd and Nikrah, the gods of love and hate, are possibly only other forms of the two 'Athtars. The Sabæans also recognize 'Athtar; but with them he is superseded by Almaḳah, who, according to Hamdání, is the planet Venus, and therefore is identical with 'Athtar. The moon-god Sín appears on an inscription of Shabwat; but, according to Hamdání, Haubas, "the drier," was the Sabæan moon-god. On the Shabwat inscription 'Athtar is the father of Sín, and it is noteworthy that these two deities also appear as nearly related in the Babylonian legend of 'Ishtar's descent to Hades, where 'Ishtar is conversely the daughter of the god Sín. The mother of 'Athtar on another inscription is probably the sun. We find also the common Semitic Il (El) and a Dhú Samai answering to the northern Ba'al Shamayim. Three gods of the inscriptions are named in the Koran,—Wadd, Yaghúth, and Nasr. In the god-name Ta'lab there may be an indication of tree-worship. The many minor deities may be passed over; but we must mention the sanctuary of Riyám, with its images of the sun and moon, and, according to tradition, an oracle. In conformity with old Semitic usage, pilgrimages were made at definite seasons to certain deities, and the Sabæan pilgrim month, Dhú Hijjatán, is the northern Dhú'l-Ḥijja. The outlines, and little more, of a few of the many temples can still be traced. Noteworthy are the elliptic form of the chief temples in Ma'rib and Ṣirwáḥ, and the castle of Naḳab-al-Ḥajar with its entrances north and south.

Sacrifices and incense were offered to the gods. The names for altar (*midhbaḥ*) and sacrifice (*dhibḥ*) are common Semitic words, and the altar of incense has among other names that of *miḳtar*, as in Hebrew. A variety of spices—the wealth of the land—are named on these altars, as *rand*, *ladanum*, *costus*, *tarum*, etc. Frankincense appears as *lubán*, and there are other names not yet understood. The gods received tithes of the produce of trade and of the field, in kind or in ingots and golden statues, and these tributes, with free-will offerings, erected and maintained the temples. Temples and fortifications were often combined. The golden statues were votive offerings; thus a man and his wife offer four statues for the health of their four children, and a man offers to Dhú Samai statues of a man and two camels, in prayer for his own health and the protection of his camels from disease of the joints.

Their commerce brought the Sabæans under Christian and Jewish influence; and, though the old gods were too closely connected with their life and trade to be readily abandoned, the great change in the trading policy, already spoken of, seems to have affected religion as well as the state. The inland gods lost importance with the failure of the overland trade, and Judaism and Christianity seem for a time to have contended for the mastery in South Arabia. Jewish influence appears in the name Raḥmán (see above), while efforts at Christianization seem to have gone forth from several places at various times. According to Philostorgius, the Homerites were converted under Constantius II. by the Indian Theophilus, who built churches in Ẓafar and Aden. Another account places their conversion in the reign of Anastasius (491–518). In Nejrán Syrian missionaries seem to have introduced Christianity (Nöldeke). But, as the religion of the hostile Ethiopians, Christianity found political obstacles to its adoption in Yemen; and as heathenism had quite lost its power, it is intelligible that Dhú Nuwás, who was at war with Ethiopia before the last fatal struggle, became a Jew. His expedition against Christian Nejrán had therefore political as well as religious motives. The Ethiopian conquest rather hurt than helped Christianity. The famous *ḳalís* (ἐκκλησία) of Abraha in San'á seems to have been looked on as a sign of foreign dominion, and Islám found it easy to supersede Christianity in Yemen.

Coins.—In older times and in many districts coins were not used, and trade was carried on mainly by barter. Nor have there yet been many great finds of coins; indeed most of the pieces in European collections probably come from the same hoard. At the same time the coins throw a general light on the relations of ancient Yemen. The oldest known pieces are imitations of the Athenian mintage of the 4th century B.C., with the legend AΘE and the owl standing on an overturned amphora. The reverse has the head of Pallas with a Sabæan N. Of younger coins the first series has a king's head on the reverse, and the old obverse is enriched with two Sabæan monograms, which have been interpreted as meaning "majesty" and "eponymus" respectively. In a second series the Greek legend has disappeared, and, instead of the two Sabæan monograms, we have the names of the king and the eponymus. A third series shows Roman influence and must be later than the expedition of Gallus. As the standard of the coins of Attic type is not Attic but Babylonian, we must not think of direct Athenian influence. The type must have been introduced either from Persia or from Phœnicia (Gaza). One remarkable tetradrachm with the Sabæan legend Abyath'á is imitated from an Alexander of the 2d century B.C., the execution being quite artistic and the weight Attic. There are also coins struck at Raydán and Ḥarib, which must be assigned to the Himyarite period (1st and 2d century A.D.). The inscriptions speak of "bright Hayyilí coins in high relief," but of these none have been found. They also speak of sela' pieces. The sela' in late Hebrew answers to the older shekel and the mention of it seems to point to Jewish or Christian influence.

YENISEI. See Siberia and Yeniseisk.

YENISEISK, a province of Eastern Siberia, which extends from the Chinese frontier to the shores of the

Arctic Ocean, with an area of 992,870 square miles—as large as one-half of European Russia—has Tobolsk and Tomsk on the W., Yakutsk and Irkutsk on the E., northwestern Mongolia on the S., and the Arctic Ocean on the N. (see vol. xxii. pl. I.). Its southern extremity being in 51° 45′ N. lat. and its northern (Cape Tcheluskin) in 77° 38′, it combines a great variety of orographical types, from the Sayan alpine regions in the south to the *tundras* of the Arctic littoral.

Orography.

The border-ridge of the high plateau of northwestern Mongolia, which is known under the general name of the Western Sayans, and reaches altitudes of from 7000 to 8000 feet, limits it in the south. This is girdled on the northwestern slope by a zone, nearly 100 miles wide, of alpine tracts, characterized by narrow valleys separated by several parallel chains of mountains, which are built up of crystalline slates, from 6000 to 7000 feet high. Here in the impenetrable forests only a few Tungus families find a precarious living by hunting. Towards the south, in the basins of the tributaries of the Tuba, the Sisim, and the Yus, and in those of the Kan, the Agul, and the Biryusa, the valleys of the alpine tracts contain rich auriferous deposits, and numerous gold-washings have been established along the *taiga*. In 53° 10′ N. lat. the Yenisei emerges from the mountain tracts into the wide steppes of Abakan and Minusinsk, from 1500 to 2000 feet above sea-level, which extend along the base of the mountain region northeastwards towards the upper Lena. A flattened ridge of mountains, hardly attaining more than 3000 to 3500 feet, shoots northeast from the Kuznetskiy Alatau (see TOMSK) and separates the dry steppes of Minusinsk and Abakan from the next terrace of plains, from 1200 to 1700 feet in height, which also stretches in a northeastern direction from Barnaul in the Altai to Krasnoyarsk, and into the upper basin of the Vilui. Another system of mountains, known under the general name of the Yeniseisk Taiga, rises on the outer border of this terrace, in the space between the Upper Tunguska, or Angara, and the Podkamennaya Tunguska. This system consists of several parallel chains running southwest to northeast, from 2500 to 3500 feet in altitude, though they are much lower on the left bank of the Yenisei, and passing on northeastwards into the basin of the Olenek. For many years past the Yeniseisk Taiga has been one of the richest auriferous regions of Siberia, not so much on account of the percentage of gold in its alluvial deposits (which are poor in comparison with those of Olekminsk) as on account of the facilities for supplying the gold-fields with articles of food produced in the steppes of Minusinsk.

Lowlands.

Beyond the Yeniseisk Taiga begin the lowlands, which at no point rise more than a few hundred feet above the sea and which slope gently towards the Arctic Ocean. They are covered with lakes, thin forests, and marshes; and, as they approach the ocean, they assume more and more the characters of barren tundra, devoid of tree vegetation and covered with lichens. Beyond 70° N. lat. trees occur only along the courses of the rivers. Two ranges, however, break the monotony of the lowlands, —the Tungusskiy ridge, which stretches northeast between the Khatanga and Anabara rivers, and the Byrranga Mountains, which run along the northwestern shore of the Taimyr peninsula.

Arctic shores.

The shores of the Arctic Ocean are indented by deep estuaries, that of the Taz penetrating 600 miles into the interior of the continent, and that of the Yenisei 300 miles. Gyda Bay, between the estuaries of the Ob and the Yenisei, and Taimyr, Thaddeus, and Khatanga Bays, are wide and deep indentations, ice-bound almost all the year round. Taimyr peninsula, which protrudes as a massive block of land between the Yenisei and the Khatanga, is an utterly barren stony tundra.

Geology.

In the south are the granites and granitic syenites of the border-ridge of the plateau. In the alpine region all varieties of crystalline slates—gneisses, diorite slates, talc and mica-schists, and clay slates —are found, the latter being auriferous, and the whole intersected with dykes and veins of protogene, diorites, porphyry, marble, and quartz. The same crystalline rocks are met with in the Kuznetskiy Alatau, the Yeniseisk Taiga, and the Byrranga Mountains. The plains are built up of Silurian, Devonian, Carboniferous, and Triassic limestones and sandstones, with extensive freshwater deposits of the Jurassic period. Chalk and Eocene deposits are met with farther north. The mountain region bears traces of extensive glaciation, and the lowlands of having been covered during the post-Glacial period with immense lakes and marshy tundras, where thousands of mammoths and rhinoceroses were buried, along with other (now fossil) representatives of extinct Tertiary and post-Tertiary mammals. All the country gives evidence of having been covered with numberless lakes during the Lacustrine period.

Minerals.

Yeniseisk is exceedingly rich in all kinds of metals and minerals. Gold dust appears in three different regions,—the northern Yeniseisk Taiga, where 100,740 oz. of gold were extracted in 1884; the region of the Kuznetskiy Alatau and its spurs, with the basins of the Tuba, Sisim, and Black and White Yus (25,860 oz. in 1884); and the upper parts of the tributaries of the Kan and Agul (12,540 oz.), where the gold-washings merge into those of the Nijne-Udinsk district of Irkutsk. Silver ore is found at several places in the basin of the Abakan, but the mines have been abandoned. Iron ore occurs almost everywhere in south Yeniseisk, but there is only one iron-work on the Abakan (25,000 cwts. in 1884). Salt lakes are very common, and about 50,000 cwts. of salt are extracted every year.

Rivers.

The whole of Yeniseisk is watered by the Yenisei and its affluents. The Yenisei rises in north western Mongolia in several branches (Bei-khem, Uln-khem, etc.), the chief of which, the Uln-khem, has its source in marshes to the west of Lake Kossogol at a height of more than 5000 feet. As far as the Russian frontier its course crosses the plateau at an altitude of not less than 3000 feet; on entering Yeniseisk it pierces the great border-ridge and the series of parallel chains of the alpine region. At Sayansk (53° 10′ N. lat.) it emerges from the highlands and traverses the elevated steppes, receiving the Abakan on the left and the Tuba on the right. In 55° N. lat. it suddenly turns to the northeast, skirting the base of a low range of hills, on the northern slope of which flows the Tehulym, a tributary of the Ob, separated from the Yenisei by an isthmus only six miles in width. The possibility of connecting at this point the two great river-systems of Siberia has often been discussed; the difficulty is that the Tchulym valley is 440 feet higher than the other. A little below Krasnoyarsk the Yenisei is joined by a great tributary, the Kan, and farther north by the Angara or Upper Tunguska, which brings the waters of Lake Baikal[1] and is navigable from Irkutsk, notwithstanding a series of rapids in its middle course. The right-hand tributaries of the Ob,—the Ket, the Tym, and the Vakh,—approach the Yenisei so closely, and their sources are so thoroughly inoculated with those of the left-hand tributaries of the Yenisei, that the question of connecting the two systems by means of a canal has been more than once raised; indeed something has been done to connect the Great Kas, a tributary of the Yenisei, with the Ket,—a boat with some 150 cwts. of cargo having already passed from the one to the other.[2] A railway across the narrow isthmus between the Tehulym and the Yenisei is now regarded as the best solution of the question. In 61° N. lat. the Yenisei, already more than 2 miles broad, divides into several branches, which wind amidst many islands, and has several dangerous rapids. Then, before piercing a ridge of hills, it expands into a kind of lake, ten miles across, just above its junction with the Podkamennaya Tunguska. Almost exactly at the Arctic Circle, opposite Turukhansk, it receives from the right another large tributary, the Lower Tunguska, which rises within a short distance of the upper Lena. The Yenisei, thus augmented, becomes more than 6 miles wide in lat. 68°. Its estuary begins at the village of Dudino, and has a breadth of 40 miles; it contains numberless islands. The great river narrows once more (12 miles) before entering the Arctic

[1] According to recent measurements, the Angara, where it issues from Lake Baikal, has a volume of 121,400 cubic feet per second (*Izvestia*, East Siberian Geogr. Soc., xvii., 1886).

[2] According to Baron Aminoff's measurements, Lake Bolshoye, through which the canal would have to pass, is 66 feet above the Ket at its junction with the Ozernaya, and 181 feet above the Yenisei at its junction with the Kas.

Ocean (Yenisei Bay), after a total course of more than 3000 miles. It is navigable on its middle and lower courses, steamers plying between Krasnoyarsk and Minusinsk, as also on the lower Yenisei. Its mouth has been visited almost every year of late by steamers from Norway or Great Britain; and it is expected that regular communication will be established between Dudino and European ports.

Climate.

The climate, though very severe throughout, offers, as might be expected, great varieties. The Minusinsk steppes have a dry and relatively mild climate, so that they are sometimes called the Italy of Siberia. At Krasnoyarsk (55° 1′ N. lat.) the climate is more severe, and the winds are exceedingly disagreeable. The yearly fall of snow is so small that the winds blow it away in the neighborhood of the town; hence, a circuit has to be made by the convoys of sledges to avoid it, or the sledges changed for wheeled carriages. Yeniseisk (58° 27′ N. lat.) has an average temperature below freezing-point, and at Turukhansk the coldest month (February) has an average temperature of —24° Fahr. On the Taimyr peninsula the average summer temperature hardly reaches 45°. For additional particulars, see SIBERIA, vol. xxii. p. 10–11.

Flora.

The highlands of Sayan and Ałatau are thickly clothed with forests of cedar, pitch-pine, larch, elder, and birch, with a rich undergrowth of rhododendrons, *Berberis*, and *Ribes;* the Scotch fir appears only in the lower and drier parts of the valleys. The summits and slopes of the mountains are strewn with débris and boulders, and thickly sheeted with lichens and mosses; but there are also patches of meadow land covered with flowers, most of which are known in Europe. Still, the flora is poor as a rule, and Dr. Martianoff, after several years' collecting, succeeded in gathering only 104 species of phanerogams.[1] On the other hand, the flora of the Minusinsk plains and of the steppes of the Abakan at once strikes the traveller by the variety and brilliancy of its forms. The meadows are covered with bright flowers scattered amid the common *Gramineæ*, and in June and July they are adorned and perfumed by the *Polygala*, *Dianthus*, *Medicago*, *Lathyrus*, yellow sweet-scented lily, and scores of other flowers, mostly familiar in Europe, but attaining in Yeniseisk a larger size and greater brilliancy of color. The rich carpet of grass and flowers is overtopped by the tall white blossoms of *Archangelica* and *Spiræa Ulmaria*, and the blue masses of the tall *Veronica longifolia*. The meadows of the moister localities, surrounded by thickets of willow, poplar, wild cherry, and hawthorn, are still more attractive, on account of their wealth in anemones, violets, gentians, and so on, and the numerous creepers which festoon the trees and shrubs. M. Martianoff's lists enumerate a total of 760 flowering and 760 cryptogamic plants. Of the lower *Fungi* and parasitical *Myxomycetes* 1300 species were noted, and out of the 823 species hitherto described by specialists no less than 124 have proved to be new. Farther northward the flora of Yeniseisk is similar in character to that of the Siberian lowlands (see SIBERIA, vol. xxii. pp. 11–12. In the Taimyr peninsula it is represented by only 124 species of flowering plants.

For the fauna of Yeniseisk, see SIBERIA, vol. xxii. pp. 12–13.

Fauna. Population.

The steppes of the upper Yenisei have been inhabited from a very remote antiquity, and numberless *kurgans*, graves, rock inscriptions, and smelting furnaces of the successive inhabitants are scattered all over the prairies of Abakan and Minusinsk.[2] The present population exhibits traces of all these predecessors (see SIBERIA and TARTARS). Numerous survivals of Turkish and Samoyedic stems are found in the steppe land and in the Sayans; but some of them are greatly reduced in numbers (only a few hundreds). The Kaibals, the Katcha Tartars, the Sagais, the Kyzyl and Milet Tartars, and the Kamasins have settlements of their own, and maintain their national features; but the Karagasses, the Kotts, and the Arintses have almost entirely disappeared, and are represented only by a few families in the spurs of the Sayans.[2] The Tunguses are scattered in the least accessible tracts, and may number about 2000, or less. Several hundreds of Yakuts inhabit the Turukhansk district; and in the tundras between the Taz and the Yenisei there are a few hundred OSTIAKS (*q.v.*) and Yuraks of the Samoyedic stem. The remainder of the population, which numbered in all 447,076 in 1885, consists of Russians,—partly exiles, but mostly voluntary settlers. Nearly 50,000 belong to the unfortunate category of "settled" exiles. The "indigenes"—Tartars, Tunguses, Ostiaks, etc.—number about 50,000.

Occupations.

The chief occupation of the Russians is agriculture, which prospers in Minusinsk, the granary of the province; it is also carried on in west Kansk, Krasnoyarsk, and Atchinsk, and in a few villages of the Yeniseisk district, the total area of land under corn being reckoned at nearly 2,500,000 acres. Wheat, summer and winter rye, oats, barley, and buckwheat are the chief crops. Gardening is carried on in Minusinsk. Cattle-breeding is important, especially in Minusinsk. It has been estimated that there are in Yeniseisk about 270,000 horses, 240,000 cattle, 300,000 sheep, and 30,000 reindeer in Turukhansk. These figures, however, must be below the true ones. The cattle being kept throughout the winter in the steppes, the snow-storms of early spring prove disastrous, as also do the murrains, to which no fewer than 200,600 head succumbed in the Minusinsk district in 1881. Hunting and fishing are an important resource for most of the indigenes and for many of the Russians.

Manufactures.

The manufactures of Yeniseisk are hardly worth mentioning, all capital being engaged in gold-washing or in commerce. The chief trade is in furs (exported), and in groceries and manufactured goods (imported). The gold-fields of the Yeniseisk Taiga are supplied with grain and cattle by river from the Minusinsk region, and with salt, spirits, and iron by the Angara. Attempts have recently been made to stimulate the trade in tea with northwest Mongolia.

Towns.

Yeniseisk is divided into five districts, the chief towns of which are KRASNOYARSK (*q.v.*), the capital, which had 17,155 inhabitants in 1884; Atchinsk (7190) and Kansk (4050), two small towns on the great Siberian highway, of which the latter is an entrepôt for the gold-mines; Minusinsk (8270) on the Tuba, close by its junction with the Yenisei, which has now a small but excellent natural history and ethnographical museum; and Yeniseisk (7050), the chief entrepôt for the gold-mines, having a public library and a natural history museum, created of late by exiles. Turukhansk (139) is the chief town of a vast "region" (*krai*). (P. A. K.)

YEOLA, a municipal town of India, in the Násik district, Bombay presidency, with a population (1881) of 17,685 (males 8975, females 8710). It is situated in 20° 4′ 10″ N. lat. and 74° 30′ 30″ E. long., 44 miles east of Násik town, 13 miles south of Manwar station on the northeast line of the Great Indian Peninsular Railway, and nearly 12 miles from the frontier of the Nizam's dominions. Yeola is a flourishing commercial town, trading in silk and cotton goods, which it weaves, and in gold-twist, which it also manufactures.

At the time of its foundation Yeola was under the emperor of Delhi; it subsequently passed into the hands of the rajas of Satara and then the peshwás. Finally it was given in grant to Vithal, the ancestor of the present chief of Vinchur, who still enjoys the revenue from the lands attached to the town, though he has no authority within it.

YEOMANRY CAVALRY. See VOLUNTEERS.

YEOVIL, a market town and municipal borough of Somerset, England, is situated on the river Yeo or Ivel, which here separates Somerset from Dorset, and on branch lines of the London and Southwestern and the Great Western Railways, 40 miles south of Bristol and 124 west-southwest of London. The streets are regular and spacious, with a number of handsome public buildings. A few of the houses are of considerable antiquity, but within recent years the town has undergone much alteration. The church of St. John the Baptist, occupying a commanding site in the centre of the town, is a large and beautiful cruciform structure in the Perpendicular style, consisting of chancel, nave of seven bays, aisles, transepts, and lofty western tower. It is described by Mr. Freeman as "a grand and harmonious whole, as truly the work of real artistic genius as Cologne or Winchester." There are two ecclesiastical parishes within the borough, Hendford and Yeovil Marsh. The principal secular public buildings are the town-hall in the

[2] Besides the works of Radloff, and those mentioned in the bibliography of Semenoff's *Dictionary*, see N. Savenkoff's paper on recent explorations, in *Izvestia* of East Siberian Geogr. Soc., xvii., 1887, and the *Descriptive Catalogue of the Minusinsk Museum*, by D. Klementz.

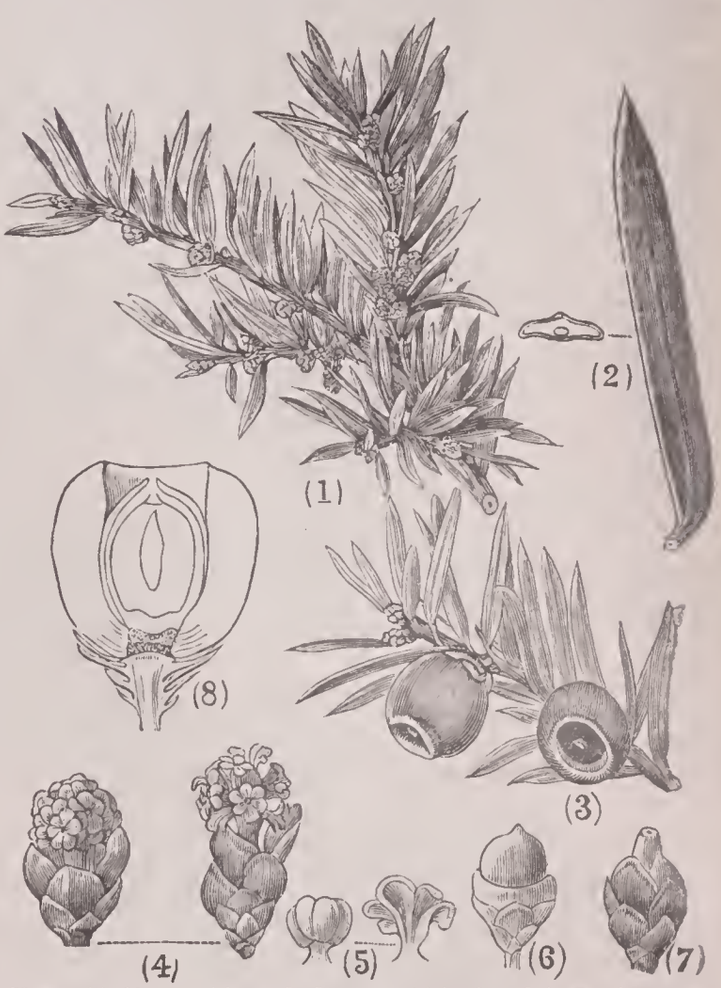
[3] Radloff's *Aus Sibirien* (2 vols., Leipsic, 1880) contains full accounts of the various Turkish stems of Yeniseisk.

Grecian style, erected in 1849, and the corn exchange. There are a reading room and a library in connection with the young men's Christian association and mutual improvement society. The benevolent institutions include Woborne's almshouses for six men and six women, the portreeves' almshouses, and a few smaller charities. Water is obtained from Holywell, 8 miles distant, by works constructed by the corporation. Formerly the woollen manufacture was of some consequence, but this industry has now died out. The staple industry is the manufacture of gloves, for which the town has long been celebrated. Brewing and brick-making are also carried on. The agricultural trade of Yeovil is of some importance, large corn markets and cattle and horse fairs being held. The corporation consists of a mayor, four aldermen, and twelve councillors, who hold the manorial rights and also form the urban sanitary authority. The town has a commission of the peace, and petty sessions are held both by the county and the borough magistrates. The population of the municipal borough and urban sanitary district (area about 700 acres) in 1871 was 8527, and in 1881 it was 8479.

Yeovil was a borough by prescription. Anciently it was called the town, borough, lordship, and hundred of Yeovil, and was included in a district which soon after the Conquest was taken possession of by the crown. The manor of Yeovil included in this district was some time afterwards assigned to the rector of St. John the Baptist church, and was incorporated under the name of the portreeve and burgesses of Yeovil. In 1418 it was resigned by the rector to Henry V., who gave the manor to the convent of the Virgin Mary and Saint Bridget. The grant was confirmed by Edward IV. After the dissolution of the monasteries the manor was settled by Henry VIII. on Catherine Parr, who held it till her death. In 1449 the town was visited by a fire, by which 117 houses were destroyed. In 1853 Yeovil was placed under the Municipal Act.

YEW. This tree (*Taxus*) belongs to a genus of *Coniferæ* in which the ordinarily woody cone is represented by a fleshy cup surrounding a single seed. Usually it forms a low-growing tree of very diverse habit, but generally with dense spreading branches, thickly covered with very dark green linear leaves, which are given off from all sides of the branch, but which, owing to a twist in the base of the leaf, become arranged in a single series on each side of it. The trees are usually dioecious: the male flowers are borne on one individual and the female on another, although instances occur in which flowers of both sexes are formed on the same tree. The male flowers are more or less globular and occur in the axils of the leaves. They consist of a number of overlapping brownish scales, gradually increasing in size from below upwards and surrounding a naked stalk that bears at its summit a head of anthers. Each anther has a flat five-lobed top, something like a shield; from its under surface five, six, or more pollen cases hang down, and these open lengthwise to liberate the globose pollen-grains. Each flower thus consists of a number of monadelphous stamens; but, according to the older view of its structure, each stamen constitutes of itself a single flower, the whole mass being considered as an amentaceous inflorescence or catkin of numerous monandrous flowers. The female flowers are also placed each separately in the axil of a leaf, and consist of a number of overlapping scales, as in the male. These scales surround a cup which is at first shallow, green, and thin, but which subsequently becomes fleshy and red, while it increases so much in length as almost entirely to conceal the single straight seed. It is clear that the structure of the female flower differs from that of most conifers; but the structure of the wood and other characters forbid its being separated from them except as a subdivision (*Taxaceæ*).

The poisonous properties, referred to by classical writers such as Cæsar, Virgil, and Livy, reside chiefly if not entirely in the foliage. This, if eaten by horses or cattle, especially when it has been cut and thrown in heaps so as to undergo a process of fermentation, is very injurious. The leaves have also been used for various medicinal purposes, but are seldom employed now. The succulent portion of the yew berry is quite harmless; but it is probable that some noxious principle is contained in the seed. As, however, it is hard and disagreeable to the taste, the danger from this source is not great. As a timber tree it is used for cabinet-work, axle-trees, bows, and the like, where



Yew. (1) Shoot with male flowers; (2) leaf and in section, magnified; (3) fruit; (4) male flowers; (5) stamens; (6), (7) female flower in different stages; (8) section of female flowers, magnified.

strength and durability are required.

The yew occurs wild over a very large area of the northern hemisphere. In northeastern America and in Japan trees are found of a character so similar that by some botanists they are all ranged under one species. The varieties grown in the United Kingdom are very numerous, one of the most striking being that known as the Irish yew,—a shrub with the pyramidal or columnar habit of a cypress, in which the leaves spread from all sides of the branches, not being twisted, as they usually are, out of their original position. In the ordinary yew the main branches spread more or less horizontally, and the leaves are so arranged as to be conveniently exposed to the influence of the light; but in the variety in question the branches are mostly vertical, and the leaves assume a direction in accordance with the ascending direction of the branches.

The yew is a favorite evergreen tree, either for planting separately or for hedges, for which its dense foliage renders it well suited. The wood is very hard, close-grained, and of a deep red-brown color internally. Its younger branches, owing to their toughness, were formerly used for bows. The planting of the yew in churchyards was at one time supposed to have been done with a view to the supply of yew staves. But, while importation from abroad was fostered, there seems to have been no statute enforcing the cultivation of the yew in Great Britain; on the other hand, a statute of Edward I. (cited in *Gard. Chron.*, 6th March,

1880) states that the trees were often planted in churchyards to defend the church from high winds. Be this as it may, yews of huge size and great antiquity still exist in various parts of the country in the vicinity of churches. Some of these are of historic interest; but it is hardly prudent to cite either the measurements or the allegations as to age, the circumstances under which the estimates were framed being different in each case. Accurate comparative measurements made on a uniform plan would be very serviceable. The Crowhurst yew, mentioned by Evelyn as 30 feet in circumference, was still in existence in 1876 (*Gard. Chron.*, 22d July, 1876). The large yew at Ankerwyke near Staines, with a trunk 27⅔ feet in circumference, might well have been in existence in 1215, when Magna Charta was signed. Considerable interest also attaches to the fine yew in Buckland churchyard near Dover, which in 1880 was removed to a distance of 60 yards. The trunk had been split so that it had a direction nearly parallel with the soil. This huge tree was moved with a ball of soil round its roots, 16 feet 5 inches by 15 feet 8 inches, by 3 feet 6½ inches in depth, the weight of the entire mass being estimated at 56 tons. The dimensions of the tree in 1880 were as follows—"circumference of the main trunk, 22 feet; of the upright portion of the trunk, 6 feet 10 inches; second horizontal trunk, 10 feet 10 inches; do., south limb forking off at 9 feet from the main trunk, 7 feet 10 inches; do., west limb forking off at 9 feet from the main trunk, 8 feet 8 inches; extent of branches from centre of main trunk southwards, 30 feet 10 inches, and from north to south 48 feet; they extend from the main trunk westward 33 feet." The tree was replanted so that the horizontal portions were replaced in their original erect position and the natural symmetry restored (*Gard. Chron.*, 1st May, 1880).

YEZD. See YAZD, p. 769 above.

YEZO. See JAPAN.

YOH-CHOW FU, a prefectural city in the Chinese province of Hoo-nan ("south of the lakes"), stands on high ground on the east side of the outlet of Tung-ting Lake, in 29° 18′ N. lat. and 113° 2′ E. long. The district in which Yoh-chow Fu stands is the ancient habitat of the aboriginal San Miao tribes, who were subsequently deported into northwestern China, and who, judging from some of the non-Chinese festival customs of the people, would appear to have left traditions behind them. The present city, which was built in 1371, is about 3 miles in circumference and is entered by four gates. The walls are high and well built, but were not strong enough to keep out the Taiping rebels in 1853. Situated between Tung-ting Lake and the Yang-tze-kiang, Yoh-chow Fu forms a depôt for the native products of the province which are destined for export, and for foreign goods on their way inland. In 1885 foreign goods to the value of 28,228 taels were sent from Hankow to Yoh-chow Fu, the principal items being gray shirting, oil, and lead. The city is 4250 Chinese miles from Peking, and contains a population of about 60,000.

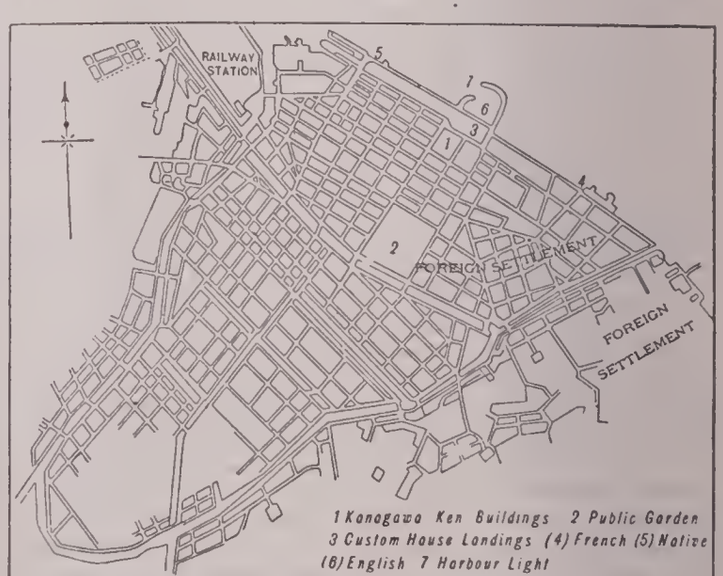
YOKOHAMA, situated in 35° 26′ 53″ N. lat. and 139° 38′ 39″ E. long. (see map in vol. xxiii. p. 461), is the most important of the five ports in Japan open by treaty to foreign commerce and residence, both on account of its proximity to Tokio, the capital, and of the extent of its trade. It stands on a plain, extending along the Bay of Tokio and shut in by hills, one of which, towards the southeast, terminates in a promontory called Honmokumisaki. Its area extends over .873 of a square mile, of which .26 is occupied by the foreign settlement. The climate is variable, the range in temperature being from 95° to 43° Fahr., and the mean temperature 57.7°. The cold in winter is severe, owing to the prevalence of northerly winds, while the heat is great in summer, though it is tempered by sea breezes from the southwest. The rainfall is large—according to Dr. Hepburn's observations (1863–1869) 69¼ inches annually. In 1859, when the neighboring town of Kanagawa was opened to foreigners under the treaty with the United States, Yokohama was an insignificant fishing village; and notwithstanding the protests of the foreign representatives the Japanese Government shortly afterwards chose the latter place as the settlement instead of Kanagawa. The town has since increased so rapidly that in 1886 the population was 111,179 (3904 foreigners, including 2573 Chinese, 256 Americans, and 625 British). The Japanese Government has constructed various public buildings, a granite breakwater, and a causeway 2 miles long, connecting the town with Kanagawa. Waterworks on the most improved principle have been completed recently, the water being supplied from the Sagamigawa. The foreign settlement consists of well-constructed streets with business establishments. The wealthier portion of the foreigners reside, however, on a hilly locality to the south of the town, called the Bluff. The land occupied by foreigners has been leased to them by the Japanese Government, 20 per cent. of the annual rent being set aside for municipal expenses.

The following table shows the value of the foreign trade of Yokohama from 1878 to 1886:

	Exports.	Imports.
1878	£3,116,896	£5,077,769
1879	3,873,459	4,799,456
1880	3,792,991	5,378,385
1881	4,319,077	4,404,289
1882	5,451,803	4,155,628
1883	5,245,290	3,925,392
1884	4,381,026	3,967,644
1885	.....	.....
1886	6,502,466	4,116,842

The figures for the bullion trade in 1886 were—export (gold) £9291 [$45,154.26], (silver) £1,243,569 [$6,043,740.48]; import (gold) £4776 [$23,211.86], (silver) £1,903,010 [$9,248,628.60]. The revenue from custom dutics, etc., in the same year was—export duties, £212,587 [$1,033,172.82]; import duties, £198,866 [$966,488.76]; warehouses, £1979 [$9698.94], harbor dues, £1870 [$9088.20].

The harbor, which is a part of the Bay of Tokio, is good and commodious, extending from Honmokumisaki (Treaty Point) to the mouth of the Tsurumi, a distance of about 5 miles. The average depth at high water is about 46 feet, with a fall of tide of about 8 feet, the entrance being marked by a lightship and two buoys. There are two landing-places, the English and the French "hatoba"; but, as there are no quays available for large vessels, goods have to be carried to the shore in junks. Steamers from San Francisco, Vancouver's Island, China, etc., call regularly. A railway about 18 miles long connects Yokohama with Tokio. This, the first railway in Japan, was constructed in 1872. Yokohama is the terminus of the Tokaido line, which will ultimately connect Yokohama with Kioto, the former capital.



Plan of Yokohama.

YOKOSUKA, a seaport and naval station of Japan,

is situated in the province of Sagami and on the Bay of Tokio, 12 miles south of Yokohama (see map in vol. xxiii., p. 461). The port is sheltered by hills and affords good anchorage. The site was occupied by a small fishing village until 1865, when the shogun's Government established a shipyard there. Since then it has grown rapidly and come into prominence. In 1868 the Japanese Government converted the shipyard into a naval dockyard, and subsequently carried out many improvements. In 1884 the port became a first-class naval station; and naval barracks, warehouses, offices, hospitals, etc., were established there. A large number of ships-of-war and of the mercantile marine are always found in the port, as well as an increasing number of foreign vessels, which come to be docked and repaired. The dockyard was first constructed by French engineers; but since 1875 the work has been entirely in the hands of Japanese engineers. The number of hands employed is about 2800. There are three dry docks and slips. The area occupied by the dockyard and other naval establishments is 7000 acres, and that of the town 270 acres. The population was 5800 in 1888.

YONKERS, a city of Westchester county, New York, United States, is situated upon the east bank of the Hudson river, about 18 miles from its mouth, and on the New York Central and Hudson River and the New York City and Northern Railroads. The site is very hilly, consisting of ridges forming terraces parallel to the river. The city had in 1880 a population of 18,892 (12,733 in 1870). Yonkers has important manufacturing industries, principally of carpets, hats, silk, brass goods, elevators (lifts), steam-engines, and machinery; but it is chiefly as a residence suburb, being within an hour of the business centre of the metropolis, that it has acquired its population and importance.

Yonkers was settled by the Dutch of New Amsterdam about the middle of the 17th century, and was held as a manor until 1779. In 1788 it was organized as a township, and in 1872 it received a city charter.

YONNE, a department of central France, was formed in 1790 partly from the province of Champagne proper (with its dependencies, Sénonais and Tonnerrois), partly from Burgundy proper (with its dependencies, the county of Auxerre and Avallonnais), and partly from Gâtinais (Orléanais and Île-de-France). It lies between 47° 18′ and 48° 25′ N. lat. and 2° 50′ and 4° 20′ E. long., and is bounded by Aube on the N.E., Côte-d'Or on the E., Nièvre on the S., Loiret on the W., and Seine-et-Marne on the N.W. The highest elevation (2000 feet) of the department is in the granite mountains of Morvan, in the southeast, where other peaks range from 1300 to 1600 feet. These mountains are flanked by limestone plateaus, from 700 to 1200 feet in height, traversed by the Yonne and its tributaries. The department belongs wholly to the basin of the Seine, except a small district in the southwest, which belongs to that of the Loire. The river Yonne flows through it from south to north-northwest, receiving on the right bank the Cure (with its tributary the Cousin), the Serein, the Armançon (the valley of which is traversed by the Burgundy Canal and by the railway from Paris to Lyons through Burgundy), and the Vanne (from which Paris is partly supplied by an aqueduct). To the west of the Yonne lie the sources of the Loing, another tributary of the Seine, and of its affluents, the Ouanne and the Lunain. The Yonne is navigable throughout the department, and is connected with the Loire by the Canal of Nivernais, which in turn is connected with that of Briare joining the Seine and the Loire. The climate of Yonne resembles that of Paris; but the extremes of heat and cold are greater on the plateaus. The annual rainfall is 27 inches at Auxerre and 32 in the east of the department. The prevailing winds are from the southwest and west.

Of a total area of 1,835,475 acres 1,125,412 acres are arable, 426,757 are under wood, 91,309 under vines, 79,366 under grass, and 39,316 are returned as occupied by heaths, pasture-lands, and marshes. The live stock in 1880 included 41,295 horses, 1280 mules, 8438 asses, 126,636 cattle, 238,522 sheep of native and 58,416 of superior breed (wool-clip in 1880 566 tons), 30,561 pigs, and 6516 goats. There were also 21,411 beehives (61 tons of honey). Oxen are fattened and the well-known St. Florentin cheeses made. The wines of Tonnerre and Auxerrois are the finest red wines of Lower Burgundy, and those of Chablis are the finest white. The principal crops in 1884 were—wine 22,486,420 gallons (average of ten preceding years 28,607,370 gallons), wheat 5,500,000 bushels, meslin 192,600, rye 680,625, barley, 948,750, oats 4,677,750, buckwheat 35,200, potatoes 3,410,088, beetroot for fodder 25,060 tons, hops 79 tons, colza seed 206, hemp seed 138, hemp, 99, linseed 40, flax 22, tobacco 33, hay 386,650, clover 34,245, lucerne 30,189, and sainfoin 6297 tons. The forests consist of oak, beech, elm, hornbeam, ash, and birch, and re-plantations are being made with different kinds of pine and with larch; chestnut trees are not uncommon. In 1880 700 tons of peat were extracted; and there are fine quarries of Oolitic limestone, and of cement, ochre, fossil phosphates, china clay, and chalk. The chief industrial establishments are tanneries, forges (11,863 tons of iron in 1882), paper-mills, saw-mills, and breweries; files and other articles of steel, boots and shoes, hosiery, and champagne are also manufactured. Cereals, wines, firewood, charcoal, ochre, and bark are exported; southern wines and building materials are among the imports. There are 286 miles of railway, 318 of national and 6755 of other roads, and 205 of waterway. The population was 357,029 in 1881, and 355,364 in 1886. About 217,000 are engaged in agricultural pursuits. The department constitutes the archiepiscopal diocese of Sens, has its court of appeal at Paris, its academy at Dijon, and belongs to the district of Orleans army corps. It is divided for administrative purposes into five arrondissements. Places of note are the chef-lieu Auxerre (16,754 inhabitants in 1886), the picturesque Avallon (5768), Joigny (6189), famous for its wines, and Tonnerre (4650), for its wines and building stones.

YORK, a northern county of England, is bounded E. by the North Sea, N. by Durham (the boundary line being formed by the Tees), S. by Lincoln, Nottingham, Derby, and Chester, and W. by Lancaster and Westmorland. It is much the largest county in England, being more than double the size of Lincolnshire, which ranks next to it. The area is 3,882,851 acres, or nearly 6067 square miles, almost one-eighth of the surface of England. Of the total area 750,828 acres or about 1173 square miles are in the East Riding, 1,361,664 acres or about 2127½ square miles in the North Riding, and 1,768,380 acres or about 2763 square miles in the West Riding. The city of York, which forms an administrative division separate from the Ridings, embraces an area of 1979 acres or about 3 square miles. Plate XVIII.

The marked differences in the geological structure of Yorkshire are reflected in the great variety of its scenery. The stratification is for the most part regular, but owing to a great line of dislocation nearly coincident with the western boundary of the county the rocks dip towards the east, while the strike of the strata is from north to south. The bold and picturesque scenery of the western hills and dales is due to the effects of denudation among the harder rocks, which here come to the surface. A portion of the Pennine chain, stretching from Derbyshire to the Cheviots, runs north and south through Yorkshire, where it has an average breadth of about 30 miles. The strata here consist of (1) Silurian beds, occupying a small area in the northwest corner of the county; (2) the Carboniferous or Mountain Limestone, which has been subjected to great dislocations, the more important of which are known as the North and South Craven faults; (3) the Yoredale series, consisting of shales, flagstones, limestone, and thin seams of coal; and (4) the Millstone Grit, forming part of the hilly moorlands, and capping many of the loftier eminences. In the West Riding the Pennine range forms part of the elevated country of Craven and Dent, with Whernside (2384 feet), Ingleborough (2361), and Penyghent Geology.

(2270). Towards the east it gradually declines into a series of moorland hills. Mickle Fell in the northwest corner of the county rises to a height of 2581 feet. The scenery in the western part of the North Riding is somewhat similar to that in Craven, except that the lower hills are of sharper outline owing to the perpendicular limestone scars. To the intermingling of the limestone with the softer rocks are due the numerous "forces" or waterfalls, which are one of the special features of the scenery of this district, the more remarkable being High Force in Teesdale and Aysgarth Force in Wensleydale. The action of water on the limestone rocks has given rise to extensive caverns, of which the best examples are those of Clapham and Ingleton in the West Riding, as well as to subterranean watercourses. At Brimham, Plumpton, and elsewhere there are curious fantastic masses of rock due to irregular weathering of the Millstone Grit. The Pennine region is bounded on the southeast by the Coal Measures, forming the Northern portion of the Derbyshire, Nottingham, and Yorkshire coalfield, which in Yorkshire extends from Sheffield northwards to Leeds. To the east the Measures dip beneath the Permian beds, of which a narrow band crops up from Masham southwards. The Permian strata are overlain to the east by the Trias or New Red Sandstone, which is scarcely ever exposed, but having been partly worn away is covered with Glacial deposits of clay and gravel, forming the low-lying Vale of York, extending from the Tees south to Tadcaster and east beyond York to Market Weighton. Farther east the Triassic beds are overlain by Lias and Oolite. The Lias crops to the surface in a curve extending from Redcar to the Humber. In the Middle Lias there is a seam of valuable iron ore, the source of the prosperity of the Cleveland region. The moorlands extending from Scarborough and Whitby are formed of Liassic strata topped with beds of Lower Oolite, rising gradually to the northeast and attaining at Burton Head a height of 1489 feet, the greatest elevation of the Oolite formation in England. In the bottom bed there is a seam of ironstone, an immense nugget of which, in Rosedale, now nearly all removed, formed at one time a conspicuous cliff. In this district there are a number of picturesque eminences capped by Lower Oolites, and among the eastern slopes of the moorlands there are several charming and fertile valleys. Along the line of the Lower Oolites there is a series of low flat hills, which slope southwards under the clays of the Vale of Pickering. These clays are covered by the Chalk, forming the district of the Wolds, which again dips southwards below the clays and sands of Holderness.

Coast.

The coast is not deeply indented at any part, the inlets scarcely deserving the name of bays. Except in the Holderness region, the shore as far north as Saltburn is bold and rocky, and presents a great variety of picturesque cliff scenery, while below the cliffs there are in many cases long stretches of beautiful sands.

Rivers.

Yorkshire is famed for the beauty of its river scenery, in which respect it is scarcely surpassed by Scotland. The great majority of the rivers issue from the higher western regions and flow eastwards. The Tees, which rises on the southeast borders of Cleveland, forms throughout almost the entire length the boundary between Yorkshire and Durham. The Swale rises on the confines of Westmoreland, and after a semicircular course by Richmond joins the Ure a few miles below Boroughbridge. This latter river flows in a similar direction some miles south of the Swale through the beautiful Wensleydale, and then past Jervaulx Abbey, Masham, and Ripon. After its junction with the Swale it takes the name of the Ouse, and on being joined by the Nidd passes by York and Selby, beyond which it receives the Aire and the Trent, and finally it falls into the Humber. The Wharfe flows southeastwards from the Pennine range past Bolton Abbey, Otley, Wetherby, and Tadcaster to the Ouse near Cawood. The Aire rises in full stream from the foot of Malham Cove in Craven, and flowing past Skipton, Keighley, and Leeds, receives the Calder at Castleford, and falls into the Ouse near Goole. The Ribble flows southwards through the district of Craven into Lancashire. The Don rises in the Penistone moors, and flowing northwards by Sheffield and Doncaster falls into the Ouse near Goole. The Hull flows southwards through the East Riding to the Humber at Hull.

Lakes.

The county is almost destitute of lakes, the only sheets of water of size sufficient to lay claim to that title being Semmer Water at the upper end of Wensleydale, Malham Tarn at the head of Airedale, and Hornsea Mere near the sea-coast at Hornsea.

Minerals.

One of the chief sources of the mineral wealth of Yorkshire is the coalfield in the West Riding, the most valuable seams being the Silkstone, which is bituminous and of the very highest reputation as a house coal, and the Barnsley thick coal, the great seam of the Yorkshire coalfield, which is of special value, on account of its semi-anthracitic quality, for use in iron-smelting and in engine furnaces. The average yearly production of the Yorkshire coalfield is nearly twenty million tons, the number of persons employed above and below ground at the coal-pits being over 60,000. Associated with the Upper Coal Measures there is a valuable iron ore, occurring in the form of nodules. Large quantities of fire-clay are also raised, as well as of gannister and oil-shale. In the Middle Lias of the Cleveland district there is a remarkable bed of iron ore, of which the annual production is over six million tons, the greater proportion of the ore being converted into pig-iron in Middlesbrough, by far the most important centre of pig-iron manufacture in the kingdom. Altogether the production of pig-iron in Yorkshire is nearly one-third of that produced in England, and nine-tenths of the produce of Yorkshire belongs to the Cleveland district. Lead ore is obtained in the Yoredale beds of the Pennine range in Wharfedale, Airedale, Niddesdale, Swaledale, Arkendale, and Wensleydale. Slates and flagstones are quarried in the Yoredale rocks. In the Millstone Grit there are several beds of good building stone, but that most largely quarried is the Magnesian Limestone of the Permian series, which, however, is of somewhat variable quality.

Mineral springs.

Yorkshire is noted for the number of its mineral springs, chiefly sulphureous and chalybeate, the principal, besides those at Harrogate, being Askern, Aldfield, Boston Spa, Croft, Filey, Guisbrough, Hovingham, and Scarborough.

Agriculture.

Agriculture.—The hilly country in the west of Yorkshire embracing the northwestern corner of the North Riding and a great part of the West Riding, is chiefly pasture land, sheep being grazed on the higher grounds and cattle on the rich pastures where the limestone rock prevails. The Vale of York, with an area of about 1000 square miles, includes much fertile land occupied by all kinds of crops. The Chalk downs by careful cultivation now form one of the best soils for corn crops, the rotation being grasses, wheat, turnips, and barley. The till or boulder clay of Holderness is the richest soil in Yorkshire. A great part of the land in this district has been reclaimed from the sea, from 20,000 to 30,000 acres being protected by embankments. The Vale of Cleveland in the North Riding is well cultivated, the higher grounds in the district being chiefly pastoral. The smallest proportional area under cultivation is in the North Riding, 860,820 acres out of 1,361,664 in 1887, while in the East Riding there were 666,291 acres out of 804,798, and in the West Riding 1,210,639 acres out of 1,716,389. The proportion of permanent pasture is largest in the West Riding, 803,514 acres or about two-thirds of the area under cultivation, while in the North Riding it was 488,958 acres or rather more than one-half, and in the East Riding only 191,519 acres or considerably less than a third. On the other hand, the area under corn crops in the West Riding

was 208,890 acres, in the North Riding, 197,846 acres, and in the East Riding 254,162 acres. Wheat in 1887 occupied 66,341 acres in the East Riding, 38,437 in the North, and 58,659 in the West; barley 64,042 in the East, 61,367 in the North, and 54,592 in the West; and oats, 101,410 in the East, 85,554 in the North, and 81,314 in the West. Rye, beans, and pease occupied comparatively small areas. Liquorice is grown in the neighborhood of Pontefract. Flax is still grown, but occupies a comparatively small area, only 868 acres in 1887. Green crops in the East Riding occupied 110,806 acres (potatoes, 12,956, turnips 75,590, mangold 5297, carrots 613, cabbage, etc., 7419, and vetches, etc., 8931), in the North Riding 78,689 (potatoes 11,246, turnips 58,121, mangold 2379, carrots 110, cabbage, etc., 3329, and vetches, etc., 3504), and in the West Riding 99,596 (potatoes 23,044, turnips 62,079, mangold 3331, carrots 250, cabbage, etc., 2219, and vetches, etc., 8673). Clover and rotation grasses occupied in the East, North, and West Ridings 92,982, 71,846, and 85,075 acres respectively, and fallow land 16,388, 23,460, and 13,141 acres respectively. The areas under orchards in 1887 were—in the East Riding 849 acres, in the North 1015, and in the West, 1694, the areas under market gardens being 520, 369, and 2652 acres, under nursery grounds 104, 154, and 807 acres, and under woods (in 1881) 14,480, 49,106, and 66,014 acres respectively. Horses numbered 38,046 (23,508 used for agriculture, 14,538 unbroken horses and mares kept solely for breeding) in the East Riding, 40,384 (26,026 used for agriculture) in the North Riding, and 53,149 (35,180 used for agriculture) in the West Riding. These horses are only such as are returned by occupiers of land, and do not include the large number used for commercial purposes. The draught horses are generally of a somewhat mixed breed, but the county is famed for its breeds of hunters and of carriage and saddle horses. A breed known as Cleveland bays is much used in London carriages. Horse-racing is a favorite Yorkshire sport, the principal stables being at Malton, Beverley, Doncaster, and Middleham. Cattle in 1887 numbered 86,169 (26,211 cows and heifers) in the East Riding, 162,462 (54,111 cows and heifers) in the North Riding, 264,876 (122,457 cows and heifers) in the West Riding. The breeds of cattle are not much attended to, the custom in the hilly districts, in both the West and the North Riding, being to purchase lean cattle at the northern fairs to fatten for the Lancashire and Yorkshire butchers. The Teeswater breed is, however, on the increase in Yorkshire. In Holderness there is a short-horned breed, chiefly valuable for its milking qualities. Cheese-making is largely carried on in some districts. Sheep in 1887 numbered in the East Riding 429,252, in the North Riding 638,320, and in the West Riding 646,809. The Leicester, the Lincoln, and the South Down, and crosses between the Cheviot and Leicester, are perhaps the most common breeds. The old Wolds sheep have also been improved by crossing with Leicesters. The total number of pigs in the East Riding in 1887 was 46,332, in the North Riding 48,990, and in the West Riding 71,887. Though the large long-eared breed is still kept, the small breed is that chiefly in favor. Large numbers of pigs are kept at the dairy farms and fed mainly on whey. Yorkshire bacon is famed for its flavor.

According to the latest landowners' *Return*, 1873, the East Riding was divided among 19,576 proprietors, possessing 710,733 acres at an annual value of £2,032,195 [$9,876,467.70], or about £2, 17s. 2d. [$13.89] per acre. There were 15,012 who owned less than one acre each, and there were 4049 acres of common lands. The following possessed over 10,000 acres each: Sir Tatton Sykes 34,010 acres, Lord Londesborough 33,006, Sir G. Cholmley 20,503, Lord Wenlock 19,453, Lord Hotham, 18,683, W. H. H. Broadley 14,208, William F. Bethel, 13,396, Lord Leconfield 13,247, Lord Middleton 12,295, Crown Property 12,230, Viscountess Downe 11,595, and T. A. C. Constable 10,981. The North Riding was divided among 16,313 proprietors, possessing 1,278,884 acres at an annual value £1,841,945 [$8,951,852.70], or about £1, 8s. 9d. [$6.99] per acre. The following owned over 10,000 acres each: John Bowes 48,887, Lord Feversham 39,312, marquis of Ailesbury 15,370, Lord Bolton 15,419, Viscount Downe 15,271, earl of Carlisle 13,030, Sir G. O. Wombwell 11,912, Lord Londesborough 11,884, Mrs. D. Harcourt 11,442, Mrs. J. T. D. Hutton 10,902. There were 10,115 proprietors who possessed less than one acre, and the area of common land was 247,409 acres. The West Riding was divided among 76,913 proprietors, possessing 1,632,259 acres at an annual value of £8,199,840 [$39,851,222.40] or about £5, 0s. 5½d. [$24.41] per acre, the large rental being due to the increased rent of land in towns. There were 59,496 proprietors who owned less than one acre each, and the estimated area of common land was 99,912 acres. The following proprietors owned over 10,000 acres each: Charles Towneley 23,153, earl of Harewood 20,330, duke of Devonshire 19,333, Earl Fitzwilliam 19,165, Andrew Montagu 17,591, duke of Norfolk 15,270, George Lane Fox 15,018, earl of Dartmouth, 14,723, Walter Morrison 14,118, Sir H. J. Tufton 12,202, T. W. S. Stanhope 11,357, Ayscough Fawkes 11,205, James Farrer 11,088, marquis of Ripon 10,908, Sir H. D. Ingilby 10,610, and duke of Leeds 10,034.

Communication.—The county, especially in the manufacturing districts, is intersected with railways in all directions, the principal companies being the Northeastern, the Manchester, Sheffield, and Lincoln, the Lancashire and Yorkshire, the Midland, and the Great Northern. A considerable amount of traffic, especially in coal, is carried on by means of the canals. Communication.

Manufactures and Trade.—For many years an extensive district in the West Riding has been famed for its woollen and worsted manufactures. The early development of the industry was due partly to the abundance of water power supplied by the numerous streams in the valleys by which the district is indented; and in recent times the happy accident of the proximity of coal and iron has enabled the industry to keep pace with modern requirements. The West Riding is now the chief seat of the woollen manufacture in the United Kingdom, and has almost a monopoly in the manufacture of worsted cloths. In this industry nearly all the important towns in the Riding are engaged, Leeds having for its specialty almost every variety of woollen and worsted cloth, Bradford yarns and mixed worsted goods, Dewsbury, Batley, and the neighboring districts shoddy, Huddersfield both plain goods and fancy trouserings and coatings, and Halifax, to the neighborhood of which the cotton industry of Lancashire has also penetrated, worsted and carpets. Next to the woollen industry comes the manufacture of iron and steel machinery and implements of every variety, Leeds being one of the principal seats of all kinds of mechanical engineering, and Sheffield of iron work and cutlery. For the minor manufactures in the district, and for more specific details, reference must be made to the separate articles on the different towns. Until comparatively recently agriculture was the chief calling of the North Riding; but the discovery of iron ore in the Cleveland region has led to the formation of another great manufacturing centre, mainly devoted to the production of pig-iron, the manufacturing of steel by the basic process, and iron shipbuilding. The industrial activity of the East Riding is mostly centred in Hull, the chief port of the county, although the Lancashire ports must be regarded as the principal ports for the trade, especially of the West Riding; In the North Riding Middlesbrough is rising into importance as a shipping port, and Whitby, though not progressing as a port, has a considerable coasting trade. The fishing industry, which is of minor importance, is carried on at Hull, Filey, Whitby, and Scarborough, and a considerable number of villages. Manufactures and trade.

Scarborough is by far the most attractive and thriving watering-place north of the Thames; and a number of others, such as Whitby, Bridlington, Filey, and Saltburn, are rising yearly in repute. Among others, chiefly of local celebrity, are Redcar, Hornsea, and Withernsea. There are a considerable number of inland spas frequented to some extent by persons from other parts of the county, but the only one of wide reputation is Harrogate. Watering-places and spas.

Administration and Population.—Yorkshire has from an early period been divided into three ridings, each of which has a lord lieutenant. The East Riding has a separate court of quarter sessions and a commission of the peace. The city of York within the municipal limits constitutes a separate division of the county. The municipal city and the ainsty are for parliamentary purposes included in the North Riding, for registration purposes in the East Riding, and for all other purposes in the West Riding. The parliamentary city of York, which formerly extended beyond the municipal limits, is partly in the North and partly in the East Riding. The following table gives the population of the county and of the three ridings in 1801, 1821, 1871, and 1881: Administration and population.

	1801	1821	1871	1881
East Riding	139,433	190,449	268,466	315,460
North Riding (with the municipal city of York)	155,506	183,381	346,518	395,790
West Riding	363,953	799,357	1,821,371	2,175,314
Yorkshire	658,892	1,173,187	2,436,355	2,886,564

The population has more than quadrupled since 1801, the increase having been much the greatest in the West Riding. Though in area much the largest, Yorkshire is in population third among English counties, being exceeded in this respect both by Lancashire and Middlesex. The number of males in 1881 was 1,420,001 and of females 1,466,563. The number of persons to an acre in the county was 0.74—East Riding 0.42, North Riding (not including the city of York) 0.25, and West Riding 1.23. The East Ridiug comprises 6 wapentakes and the municipal boroughs of Beverley (pop. 11,425), Kingston-upon-Hull (154,240), and Hedon (966). It is divided into 12 petty and special sessional divisions. The borough of Kingston-upon-Hull has a separate court of quarter sessions and a commission of the peace, and the borough of Beverley has a commission of the peace. The riding contains 352 civil parishes with part of one other, viz., Filey, which extends into the North Riding. It is entirely in the diocese of York. The North Riding comprises 11 wapentakes, the liberties of East and West Langbaurgh and of Whitby Straud, and the municipal boroughs of Middlesbrough (55,934), Richmond (4502), and Scarborough (30,504). It is divided into 19 petty and special sessional divisions. The boroughs of Richmond and Scarborough have separate courts of quarter sessions and commissions of the peace, and the borough of Middlesbrough has a commission of the peace. The riding coutains 554 civil parishes and parts of five others. It is almost entirely in the diocese of York and Ripon. The West Riding comprises 9 wapentakes, the city of Ripon (7390), and the municipal boroughs of Barnsley (29,790), Batley (27,505), Bradford (183,032), Dewsbury (29,637), Doncaster (21,139), Halifax (73,630), Harrogate (9482), Huddersfield (81,841), Leeds (309,119), Pontefract (8798), Rotherham (34,782), Sheffield (284,508), Wakefield (30,854), and Keighley (12,085). The riding is divided into 25 petty and special sessional divisions. The city of York, the boroughs of Bradford, Doncaster, Leeds, Pontefract, and Sheffield, and the liberty of Ripon (iucluding the city) have separate courts of quarter sessions and commissions of the peace, and the boroughs of Batley, Dewsbury, Halifax, Huddersfield, aud Wakefield have commissions of the peace. The liberty and the borough of Ripon are not included in the West Riding for the purposes of the couuty rate, but are rated separately. The riding contains 724 civil parishes, and parts of six others. It is mostly in the dioceses of York, Ripon, and Manchester. For parliamentary purposes the East Riding is formed into three divisions,—Buckrose, Holderness, and Howdenshire, each returning one member. It also includes the parliamentary borough of Kingston-upon-Hull, returning three members, with part of the borough of York city, which returns two members. The North Riding for parliamentary purposes is formed into four divisions,—Cleveland, Richmond, Thirsk, and Whitby, each returning one member. It also includes the boroughs of Middlesbrough and Scarborough, each returning one member, with portions of the boroughs of Stockton and York city. The West Riding for parliamentary purposes is formed into three divisions, which are again subdivided into districts each returning one member,—the north division into five districts, the south into eight, and the east into six. The ridiug also includes the following parliamentary boroughs: Bradford returning three members, Dewsbury one, Halifax two, Huddersfield one, Leeds five, Pontefract one, Sheffield five, and Wakefield one.

History and Antiquities.—Traces of the old British inhabitants are numerous in the Wolds of the East Riding and the moors of the North Riding. Remains of the circular pit-dwellings of ancient Brigantian villages still exist at Egton Grange, Hole Pits, Killing Pits, Danby, and Roseberry Topping. A large number of implements, of both flint and bronze, have beeu discovered in the barrows on the Wolds and moors, and in the caves of the limestone district. Circles and other stone monuments are not uncommon, the most remarkable being the monolith, 29 feet in height, at Rudston, and the group of monoliths called the Devil's Arrows at Boroughbridge, 16½, 21½, and 22½ feet in height respectively. On the hill-sides there are numerous ancient earth works and dikes, such as the fortification on Flamborough Head, incorrectly called the Danes' dike. Yorkshire was included in the territory of the Brigantes at the time of its invasion by the Romans in 51; it did uot, however, make formal submission till 79. It afterwards formed part of the district of *Maxima Cæsariensis*, of which the capital was *Eboracum* (York). The central districts of Yorkshire seem to have been densely peopled by the Romans. Watling Street entered the county near Bawtry, crossed the Don at *Danum* (Doncaster), the Aire at *Legcolium* (Castleford), and the Wharfe at *Calcaria* (Tadcaster). Thence it proceeded by *Eboracum* (York), *Isurium* (Aldborough), and *Cataractonium* (Catterick Bridge) to *Ad Tisam* (Pierce Bridge), where it crossed the Tees. Another road passed eastwards from York to Malton, and various brauches traversed the county in differeut directions. A great variety of Roman remains have been discovered and traces of Roman camps are numerous, such as *Cataractonium*, the outlines of the station at Old Malton, the ancient wall with the multangular tower at York, and the remains of *Isurium*. After the departure of the Romans Yorkshire was overrun by the Picts. Subsequently it formed the Anglo-Saxon kingdom of Deira to the south of Bernicia (see vol. viii. p. 244). The two were included iu Northumbria, which seems to have been under the rule sometimes of a single prince and sometimes of two separate princes in Bernicia and Deira, the northeru boundary of the latter kingdom being probably the Tees and the southern always the Humber (see NORTHUMBERLAND, vol. xvii. p. 582 *sq.*, where the early history of the district, ineluding a notice of the Danish invasions, is given). After the Conquest, Yorkshire was divided among several Norman earls—includiug Alan of Brittany, who held Richmond Castle, Ilbert de Lacy, and William de Percy. The district was at this period frequently invaded by the Scots. In 1138 David of Scotland laid waste the country to the gates of York; but he was completely defeated by the English on 22d August of that year in the battle of the Standard at Northallerton. Iu 1312 Thomas Plantagenet, earl of Lancaster, raised an insurrection in Yorkshire against Gaveston, the favorite of Edward II., whom he captured in Scarborough and beheaded at Warwick on 19th June. The earl agaiu in 1322 headed a party against the Despensers, but on 16th March was defeated and captured at Boroughbridge, and on 22d was beheaded at Pontefract. During the Wars of the Roses the county was the scene of frequent conflicts, including the battle of Wakefield (31st December, 1460), in which Richard, duke of York, was defeated by Queen Margaret and slain, and the battle of Towton (29th March, 1461), in which Edward IV. defeated Henry VI. In 1536 the county was the scene of the insurrection under Robert Aske, known as the "Pilgrimage of Grace," caused by the dissolution of the monasteries. In 1569 a rising took place in Yorkshire under the earls of Westmorland and Northumberland in behalf of Mary Queen of Scots. During the Civil War the county was chiefly Royalist, although some of the most famous Parliameutary officers were Yorkshiremen, the more noted being Fairfax and Lambert. Bradford, Hull, Scarborough, Pontefract, and York sustained long sieges; and on 2d July, 1644, the great and decisive battle of the war occurred at Marstou Moor. The annals of the county are destitute of further incidents of special historic importance.

History.

Of ancient strongholds or castles Yorkshire has still many interesting examples iu a more or less complete condition, including Barden Tower, built in the reign of Henry VII. by Henry Clifford, "the shepherd lord," which has been in ruins since 1774; Bolton Castle, pronounced by Leland "the fairest in Richmondshire," a square building with towers at the corners, erected in the reign of Richard II. by Richard Scrope, chancellor of England, occupied by Queen Mary while under the charge of Lord Scrope, besieged during the Civil War, and rendered untenable in 1647; the square tower or keep of Bowes Castle, supposed to have been built by Alan Niger, first earl of Richmond; the gateway tower (erected in the reign of Henry VI.) of Cawood Castle, said to have been origiually built by King Athelstan in 920; the keep and various portions of the walls of the extensive fortress of Conisbrough, of uncertain origin, but probably dating from Saxon times; the remains of Danby Castle, said to have been built shortly after the Conquest by Robert de Bruce; Harewood, of great exteut, originally founded soon after the Conquest, but now containiug no portions earlier than the reign of Edward III.; the keep, in the Early English style, and other remains of Helmsley, built in the 12th century by Robert de Roos surnamed Fursan; detached portions, including the principal tower, of Knaresborough, probably dating originally from Norman times; the picturesque remains of the quadrangular fortress of Middleham, built soon after the conquest by Robert FitzRanulph, afterwards possessed by the Nevilles, and rendered untenable by order of Parliament in 1647; the ruins of the ancient stronghold of Mulgrave, said to have been originally founded two centuries before the Conquest by a Saxon giant named Wade or Wada, dismantled after the Civil War; the extensive remains—including Rosamond's Tower, associated with the misfortunes of Fair Rosamond, the mistress of Henry II.—of Pickering Castle, of unknown date, dismantled after the Civil War; the ruins of Pontefract, formerly one of the most important fortresses of the kingdom, built by Ilbert de Lacy about 1080; a few remains of Ravensworth Castle, dating from before the Conquest; the keep and other remains of the great Norman fortress of

Ancient castles.

Richmond, founded about 1070 by Alan Rufus of Brittany; the tower of Ripley, built in 1555 by Sir William Ingilby, included in the modern mansion; slight remains of the fortress of Sandal, erected in 1320 by John, eighth earl of Warren; the great tower, in the Roman style, and other remains of the extensive fortress of Scarborough, founded by William le Gros in 1136; the detached ruins of Sheriff Hutton, founded by Bertram de Bulmer in the reign of Stephen; slight remains of the ancient Skelton Castle; Skipton Castle, of various dates, but originally Norman; Slingsby Castle, originally built probably soon after the Conquest; the ruins of Spofforth, originally erected by Henry de Percy in 1309; the foundations of the keep and some fragments of the walls of Tickhill, built or enlarged by Roger de Busli in the 11th century; the remains of Whorlton, dating from the time of Richard II.; and one side of the great quadrangular castle of Wressell, built by Thomas Percy, earl of Worcester, in the reign of Richard II.

Ecclesiastical structures.

At the time of the dissolution of the monasteries Yorkshire possessed 28 abbeys, 26 priories, 23 nunneries, 30 friaries, 13 cells, 4 commanderies of Knights Hospitallers, and 4 preceptories of the Knights Templars. The principal monastic ruins still existing are St. Mary's, York (see YORK); Bolton Priory, generally called Bolton Abbey, one of the most romantically situated ruins in the kingdom, originally founded at Embsay, two miles distant, by William de Meschiues for Augustinian canons, removed to its present situation by his daughter Alice over against the spot where her only son perished in the Wharfe; the church and other ruins in the Early English style of Byland Abbey, founded for Cistercian monks in the 12th century; the picturesque ruins of Easby near Richmond, containing interesting examples of Norman and Early English, founded in 1152 for Præmonstratensians by Ronaldus, constable of Richmond Castle; Egglestone on the Tees, founded in the 12th century for Præmonstrateusians; Fountains Abbey, one of the finest and most complete among the monastic ruins of the kingdom, exhibiting fine specimens of various styles of architecture from Norman to Perpendicular, founded in 1132 for certain monks of the Benedictine abbey of St. Mary's, York, who had adopted the Cistercian rule; the eastern end of the church of Guisbrough Priory in the Pointed style, founded in 1119 by Robert de Bruce, the burial-place of many illustrious nobles; the picturesque ruins of Jervaulx, exhibiting examples of Norman and Early English, founded in 1156 for Cistercian monks by Conan, fifth earl of Richmond; the gateway and other remains of Kirkham, founded in 1121 by Walter l'Espee; the beautiful ruins of Kirkstall, exhibiting remarkably fine examples of Norman, founded in 1152 by Henry de Lacy for Cistercian monks from Fountains Abbey; the church, refectory, and other remains, in the Early English style with some traces of Norman, of Rievaulx Abbey, founded in 1131 by Walter l'Espec. There are other monastic remains of less importance at Bridlington, Coverham, Marrick, Meaux, Monk Bretton, Mount Grace, Old Malton, Roche, Rosedale, Sawley, Selby, Watton, and Whitby. In respect of church architecture Yorkshire excels any other county in the kingdom for variety of style, and the size and importance of many of the buildings. Space forbids entrance into minute details; but it may be mentioned here that, in addition to the cathedral churches of York, Ripon, and Beverley, there are several other churches on a very large scale, including St. Mary's, Beverley, chiefly Perpendicular, very elaborate in style, originally built by Archbishop Thurstan in the 12th century; the parish church of Bradford, a very fine example of Decorated; the priory church of Bridlington, containing fine examples of Norman, Early English, and Perpendicular; Halifax parish church, chiefly of the 15th century; St. Augustine's church, Hedon, Early English, Decorated, and Perpendicular, with some transition Norman; Howden, one of the finest in Yorkshire, chiefly 13th century with later additions; Holy Trinity, Hull, one of the largest parish churches in England, of the 13th century, chiefly Early English and Perpendicular; St Mary's, Masham, dating from Saxon times and having a fine Norman tower; St. Patrick's, Patrington, in the Decorated style, with a remarkably graceful spire, 189 feet in height; All Saints, Rotherham, a beautiful cruciform building, described by Rickman as "one of the finest Perpendicular churches of the north"; the abbey church, Selby, containing fine specimens of Norman, Early English, and Decorated; the parish church, Sheffield, chiefly Perpendicular; St. Mary's, Thirsk, said to have been built out of the ruins of the old castle, chiefly Perpendicular; and Wakefield parish church, chiefly of the latter part of the 15th century, with a spire 250 feet in height, rebuilt in 1860-61.

The bibliography of Yorkshire is very extensive. For histories of the several towns and districts reference may be made to Anderson's *English Topography*. The chief works relating to Yorkshire as a whole are Leland's *Itinerary*; Allen's *History of Yorkshire*, 3 vols., 1828-31; Baines's *Yorkshire Past and Present*, 4 vols., 1871-77; and Smith's *Old Yorkshire*, 5 vols., 1881-84. Among numerous works on the geology, reference may be made to Phillips's *Geology of the Yorkshire Coast*, 3d ed., 1875; Davis and Lees, *West Yorkshire*, 1878; Bird's *Sketch of the Geology of Yorkshire*, 1881; and Simpson's *Fossils of Yorkshire*, 1884. In the publications of the Surtees Society there are many volumes of genealogical or antiquarian interest relating to the county, and in *Journ. Yorks. Arch. Soc.* many valuable topographical and historical papers. See also Lefroy's *Ruined Abbeys of Yorks.*, 1883, and Bulmer's *Arch. Studies in Yorks.*, 1887. (T. F. H.)

YORK, a cathedral city and archbishop's see, the county town of Yorkshire, a county in itself, and a municipal and parliamentary borough, is situated on the river Ouse at its junction with the Foss, and on the main joint line of the Northeastern and Great Northern Railways, 188 miles north of London. The surrounding country is flat, but the plain of York is one of the richest and most fertile districts in England. While the special feature of York is the cathedral, the city generally has an antique appearance, with narrow picturesque streets, the remains of ancient walls, and many churches and other buildings of considerable architectural interest. The Ouse is crossed by three bridges for general traffic,—the Ouse bridge, of three elliptical arches, erected 1810–20 where a bridge had stood from time immemorial; Lendal bridge, opened in 1863, a handsome structure of iron, consisting of a single arch 175 feet in span; and Skeldergate bridge, 1880, constructed of iron resting on stone piers. The Foss is crossed by five bridges. Of the old Roman city there are some remains of the fortifications, including ten sides of a thirteen-sided building called the multangular tower, occupying one of the four angles of the ancient wall, with the lower part of the wall leading from this tower to Bootham Bar, the upper part of the wall being of later origin. The walls of the English city, enclosing a much wider area, though they have undergone reconstruction at various periods and were much battered during the siege of the city in 1644, are in remarkably good preservation, especially the portion to the west of the Ouse. They contain Norman and Early English architecture, but the bulk of the walls are in the Decorated style. There are four principal gates or "bars"—Micklegate Bar, at the southern entrance to the city, where the heads of traitors were formerly exposed, consisting of a square tower built over a circular arch, probably Norman, with embattled turrets at the angles: Bootham Bar, the main entrance from the north, having also a Norman arch; Monk Bar, on the Scarborough road, the most imposing of the four, probably belonging to the 14th century, formerly called Goodramgate, which after the Restoration was changed to Monk Bar in honor of General Monk; and Walmgate Bar, belonging to the time of Edward I. and retaining the barbican rebuilt in 1648. Of the Norman fortress built by William the Conqueror in 1068 some portions were probably incorporated in Clifford's Tower, which was partly destroyed by fire in 1684. It formed the keep or donjon of the later fortress, which was dismantled at the Civil War and converted into a prison. The debtors' prison, erected in 1708, and the North and East Riding assize courts, erected in 1777, are also included within the castle wall, which was constructed in 1836.

The cathedral of St. Peter, if surpassed by some other English cathedrals in certain special features, is as a whole the most striking and imposing specimen of ecclesiastical architecture in England. It is in the form of a Latin cross, consisting of nave with aisles, transepts, choir with aisles, a central tower, and two western towers. The extreme external length is 524 feet 6 inches, the breadth across the transepts 250 feet, the height of the central tower 213 feet, and the height of the western towers 202 feet. The material is magnesian limestone. The cathedral occupies the site of the wooden church in which King Edwin was baptized by Paulinus on Easter Day, 627. After his baptism Edwin, according

to Bede, began to construct "a large and more noble basilica of stone," but it was partly destroyed during the troubles which followed his death, and was repaired by Archbishop Wilfrid. The building suffered from fire in 741, and, after it had been repaired by Archbishop Albert, was described by Alcuin as "a most magnificent basilica." At the time of the Norman invasion the Saxon cathedral, along with the library of Archbishop Egbert, perished in the fire by which the greater part of the city was destroyed, the only relic of it now remaining being the central wall of the crypt. It was reconstructed by Archbishop Thomas of Bayeux (1070–1100); but of this building few portions now remain.

Plan of York.

The apsidal choir and crypt were reconstructed by Archbishop Roger (1154–91), the south transept by Archbishop Walter de Gray (1215–55), and the north transept and central tower by John Romanus, treasurer of the cathedral (1228–56). With the exception of the crypt, the transepts are the oldest portions of the building now remaining. They represent the Early English style at its best, and the view across the great transept is unsurpassed for architectural effect. The south transept is the richest and most elaborate in its details, one of its principal features being the magnificent rose window; and the north transept contains a series of beautiful lancet windows called the Five Sisters. The foundation of the new nave was laid by Archbishop Romanus (1285–96), son of the treasurer, the building of it being completed by Archbishop Melton about 1345. The chapter-house was built during the same period. The west front, consisting of a centre and two divisions corresponding with the nave and aisles, is one of the finest features of the whole building, and has been described as "more architecturally perfect as a composition and in its details than that of any other English cathedral," the great window above the door being, in the words of Mr. Britton, "an unrivalled specimen of the leafy tracery that marks the style of the middle of the 14th century." In 1361 Archbishop Thoresby (1352–73) began the lady chapel and presbytery, both in the Early Perpendicular style. The rebuilding of the choir, begun about the same period, was not completed till about 1400. It is a very fine specimen of Late Perpendicular, the great east window being one of the finest in the world. With the rebuilding of the choir the whole of the ancient Norman edifice was removed, the only Norman architecture now remaining being the eastern portion of the crypt of the second period, built by Archbishop Roger (1154–91). To correspond with later alterations, the central tower was re-cased and changed into a Perpendicular lantern tower, the work being completed in 1444. The southwest tower, was begun in 1432 during the treasurership of John de Bermingham, and the northwest tower in 1470. With the erection of this tower the church was completed as it now stands, and on 3d February, 1472, it was re-consecrated by Archbishop Neville. On 2d February, 1829, the woodwork of the choir was set on fire by Jonathan Martin, a madman. On 2d May, 1840, a fire broke out in the southwest tower, reducing it to a mere shell. The cathedral within recent years has undergone extensive restoration.

Next to the cathedral the most interesting building in York is St. Mary's Abbey, situated in Museum Gardens, founded for Benedictines by Alan, earl of Richmond, and latterly one of the most powerful ecclesiastical establishments in England, its head having the rank of a mitred abbot with a seat in parliament. The principal remains of the abbey are the north wall and the ruins of the church, in the Early English and Decorated style, and the principal gateway with a Norman arch. The hospitium, a curious building of wood is now used as a museum of antiquities,

and contains a fine collection of Roman remains discovered in the vicinity. A considerable portion of the abbey was employed for the erection of the king's manor, a palace for the lord president of the north, now occupied as a school for the blind. In the gardens is also situated the ambulatory of St. Leonard's hospital, founded by King Athelstan and rebuilt by Stephen. Besides the cathedral, York possesses a large number of churches of special architectural interest, including All Saints, North Street, Decorated and Perpendicular, with a spire 120 feet in height; Christ Church, with south door in the Decorated style, supposed to occupy the site of the old Roman palace; Holy Trinity in Goodramgate, Decorated and Perpendicular with Perpendicular tower; Holy Trinity, Micklegate, in a dilapidated condition, with Roman masonry in its foundation walls; St. Denis, Walmgate, with rich Norman doorway and Norman tower; St. Helen's, St. Helen's Square, chiefly Decorated; St. John's, North Street, chiefly Perpendicular; St. Lawrence, without the bar of Walmgate, with rich Norman doorway; St. Margaret's, Walmgate, celebrated for its curiously sculptured Norman porch and doorway; St. Mary the Elder, Bishophill, Early English and Decorated, with brick tower, rebuilt in 1659; St. Mary the Younger, Bishophill, with a square tower in the Saxon style, rebuilt probably in the 13th century; St. Mary, Castlegate, with Perpendicular tower and spire 154 feet in height; St. Michael-le-Belfry, founded in 1066, but rebuilt in 1538 in the Late Perpendicular style; and St. Olave, Marygate, Perpendicular, said to have been founded by Siward, earl of Northumberland. Among the principal secular buildings are the guild hall, with a fine old room in the Perpendicular style, erected in 1446, and containing a number of stained-glass windows; the mansion-house, built in 1725 from designs by the earl of Burlington; the assembly rooms, erected in 1730, also from designs by the earl of Burlington, with the concert-room adjoining, built in 1823; the corn exchange; the infantry barracks; the cattle market; the theatre, founded by Tate Wilkinson in 1765, and lately refaced in the Gothic style by the corporation who own the property; the De Grey rooms for balls and concerts; the fine old merchant's hall; the merchant tailors' hall; and the masonic hall. The public institutions of a learned or educational character include the Yorkshire Philosophical Society, whose museum in the Grecian style was opened in February, 1830; the subscription library, instituted 1784, and containing upwards of 20,000 volumes; the York institute of science and literature, established in 1827, and removed to the present premises in 1846; the Wilberforce school for the blind; the York fine art and industrial institution; and the Government school of art. The charities include the York county hospital, the union workhouse, the dispensary, Colton's hospital for 8 poor men, Harrison's hospital, Dorothy Wilson's hospital (founded in 1777) for 16 poor women, Sir Arthur Ingram's hospital (founded in 1640) for 10 poor widows, and the old maids' hospital for 10 poor spinsters. The principal schools are St. Peter's Cathedral grammar-school (originally endowed in 1557), Archbishop Holgate's grammar-school, the York and diocesan grammar-school, and the blue-coat school for boys (founded in 1705), with the associated gray-coat school for girls.

In modern times York has ceased to retain its commercial importance; but it possesses several iron foundries, railway engineering works, a large glass factory, breweries, flour-mills, tanneries, glove manufactories, and confectionery and other minor establishments. Within its municipal limits the city of York constitutes a separate division of the county of York; the municipal city and the ainsty are for parliamentary purposes included in the North Riding, for registration purposes in the East Riding, and for all other purposes in the West Riding. The parliamentary city of York, which formerly extended beyond the municipal limits, is partly in the North and partly in the East Riding. The corporation consists of a lord mayor, 12 aldermen, and 36 councillors. The city returns two members to parliament. In 1884 the boundaries of the city were extended to include the townships of Holgate and St. Olave, and part of the townships of Clifton, Dringhouses, Fulford, Heworth, and Middlethorpe. The population of the municipal borough (area 1979 acres) was 43,796 in 1871 and 49,530 in 1881, and that of the parliamentary borough (area 2789 acres) 50,765 in 1871 and 60,343 in 1881. The new area is about 3553 acres, with a population estimated at over 70,000 in 1888.

York, the British name of which was Caer-Ebroc, was chosen by the Romans as an important depôt after the conquest of the Brigantes by Agricola in 79 and named *Eboracum*. Ultimately it became the military capital and centre of the Roman power in Britain. The original Roman city was rectangular in form, about 650 yards by 550, and built somewhat after the plan of ancient Rome on the east bank of the Ouse. In York the emperors sat in the prætorium, and a temple was erected there to Bellona. The first emperor to take up his residence in York was Hadrian, when he visited Britain in 120. Severus died at York in February, 211, and his body is supposed to have been burned at Severus's Hill, a short distance south of the city. Constantius Chlorus also died at York in July, 306, and his son Constantine the Great was there inaugurated Roman emperor. Early in the 7th century the city under the name of Eoforwic, became the capital of the Bretwaldas. Edwin after his conversion in 627 made it an archbishop's see. The province of York, of which Paulinus was the first bishop, formerly included a great part of Scotland, but is now confined to the six northern dioceses of England. From the time of Archbishop Egbert (732–766) York became celebrated as a school of learning and under Alcuin was one of the most famous places of education in Europe. The city was one of the principal Danish settlements and seats of commerce, its population in 990 being estimated at 30,000. It was the capital of the Danish jarl; and Siward is stated to have died at York in 1055 and to have been buried in St. Olave's church. After the death of Edward the Confessor York was captured by Harold Hardrada, who, however, was shortly afterwards defeated and slain at Stamford Bridge. It was captured by William I. in 1068 and to guard it he erected a tower; but it was retaken and the whole Norman garrison put to death. In revenge for their slaughter William, on recapturing the city after a siege of six months, devastated the country between York and Durham. In 1175 Henry II. held the first English parliament at York, when William of Scotland did homage for his kingdom. The city was frequently visited by subsequent monarchs, and was the scene of important conventions and parliaments. After the suppression of the rebellion known as the Pilgrimage of Grace in 1569, the Council of the North was established at York. The city was besieged during the Civil War by the Parliamentary troops, to whom it surrendered on 16th July, 1644. York received its first charter of incorporation from Henry I.

(T. F. H.)

YORK, a borough and the county seat of York county, Pennsylvania, United States, is situated upon Codorus Creek, a branch of the Susquehanna river, and upon three railway lines,—the Pennsylvania, the Northern Central, and the Peachbottom. The surrounding country is undulating and is devoted to agriculture. The city is regularly laid out, with streets running diagonally to the cardinal points. It contains some manufactories of agricultural implements, paper-mills, car-shops, etc. The population in 1880 was 13,940; in 1870 it was 11,003.

The settlement of York dates from 1741. For nearly a year (1777–78) it was the place of meeting of the Continental Congress. In 1787 York was incorporated as a borough.

YORK, HOUSE OF. Richard, duke of York, who claimed the crown of England in opposition to Henry VI., though he never succeeded to the throne himself, was, nevertheless, the founder of a royal line. It may be said, indeed, that his claim, at the time it was advanced, was rightly barred by prescription, the House of Lancaster having then occupied the throne for three generations, and that it was really owing to the misgovernment of Margaret of Anjou and her favorites that it was advanced at all. Yet it was founded upon strict principles of lineal descent, and was certainly a strong one, if it could only be maintained that hereditary right did not suffer from interruption. For the duke was descended from Lionel, duke of Clarence, the third son of Edward III., while the House of Lancaster came of John of Gaunt, a younger brother of Lionel. The House of Lancaster, therefore, had been clearly in wrongful possession of the throne, and Richard, duke of York, claimed it as the true heir. One thing which might possibly have been considered an element of weakness in his claim was that it was derived through females,—an objection actually brought against it by Chief-Justice Fortescue. For Lionel, duke of Clarence, left only a daughter, Phil-

ippa, who married Edmund Mortimer, third earl of March; and the male line of the Mortimers also failed on the death of Edmund, the fifth earl, whose sister, and ultimately his sole heir, Annie, married Richard, earl of Cambridge, and became by him the duke of York's mother. But a succession through females could not reasonably have been objected to after Edward III.'s claim to the crown of France; and, apart from strict legality, the duke's claim was probably supported in the popular estimation by the fact that he was descended from Edward III. through his father no less than through his mother. For his father, Richard, earl of Cambridge, was the grandson of Edmund, duke of York, fifth son of Edward III.; and he himself was the direct lineal heir of this Edmund, just as much as he was of Lionel, duke of Clarence. His claim was also favored by the accumulation of hereditary titles and estates. The earldom of Ulster, the old inheritance of the De Burghs, had descended to him from Lionel, duke of Clarence; the earldom of March came from the Mortimers, and the dukedom of York and the earldom of Cambridge from his paternal ancestry. And in addition to all this his own marriage with Cecily Neville, though she was but the youngest daughter of Ralph, first earl of Westmoreland, allied him to a powerful family in the north of England, to whose support both he and his son were greatly indebted.

The reasons why the claims of the line of Clarence had been so long forborne are not difficult to explain. Roger Mortimer, fourth earl of March, was actually designated by Richard II. as his successor; but he died the year before Richard was dethroned, and his son Edmund, the fifth earl, was but a child at Henry IV.'s usurpation. Henry took care to secure his person; but the claims of the family troubled the whole of his own and the beginning of his son's reign. It was an uncle of this Edmund who took part with Owen Glendower and the Percies; and for advocating the cause of Edmund Archbishop Scrope was put to death. And it was to put the crown on Edmund's head that his brother-in-law Richard, earl of Cambridge, conspired against Henry V. soon after his accession. But this was the last attempt made in favor of the family for a long time. The plot was detected, being revealed, it is said, by the earl of March himself, who does not appear to have given it any encouragement; the earl of Cambridge was beheaded. The popularity gained by Henry V. in his French campaigns secured the weak title of the House of Lancaster against further attack for forty years.

Richard, duke of York, seems to have taken warning by his father's fate; but, after seeking for many years to correct by other means the deplorable weakness of Henry VI.'s government, he first took up arms against the ill advisers who were his own personal enemies, and at length claimed the crown in parliament as his right. The Lords, or such of them as did not purposely stay away from the House, admitted that his claim was unimpeachable, but suggested as a compromise that Henry should retain the crown for life, and the duke and his heirs succeed after Henry's death. This was accepted by the duke and an Act to that effect received Henry's own assent. But the Act was repudiated by Margaret of Anjou and her followers, and the duke was slain at Wakefield fighting against them. In little more than two months, however, his son was proclaimed king at London by the title of Edward IV., and the bloody victory of Towton immediately after drove his enemies into exile and paved the way for his coronation.

We need not follow the vicissitudes of Edward's reign, of which a brief account will be found under EDWARD IV. (vol. vii. p. 594). After his recovery of the throne in 1471 he had little more to fear from the rivalry of the House of Lancaster. But the seeds of distrust had already been sown among the members of his own family, and in 1478 his brother Clarence was put to death—secretly indeed, within the Tower, but still by his authority and that of parliament—as a traitor. In 1483 Edward himself died; and his eldest son, Edward V., after a nominal reign of two months and a half, was put aside by his uncle, the duke of Gloucester, who became Richard III., and then caused him and his brother Richard, duke of York, to be murdered. But in little more than two years the usurper was defeated and slain at Bosworth by the earl of Richmond, who, being then proclaimed king as Henry VII., shortly afterwards fulfilled his pledge to marry the eldest daughter of Edward IV. and so unite the Houses of York and Lancaster.

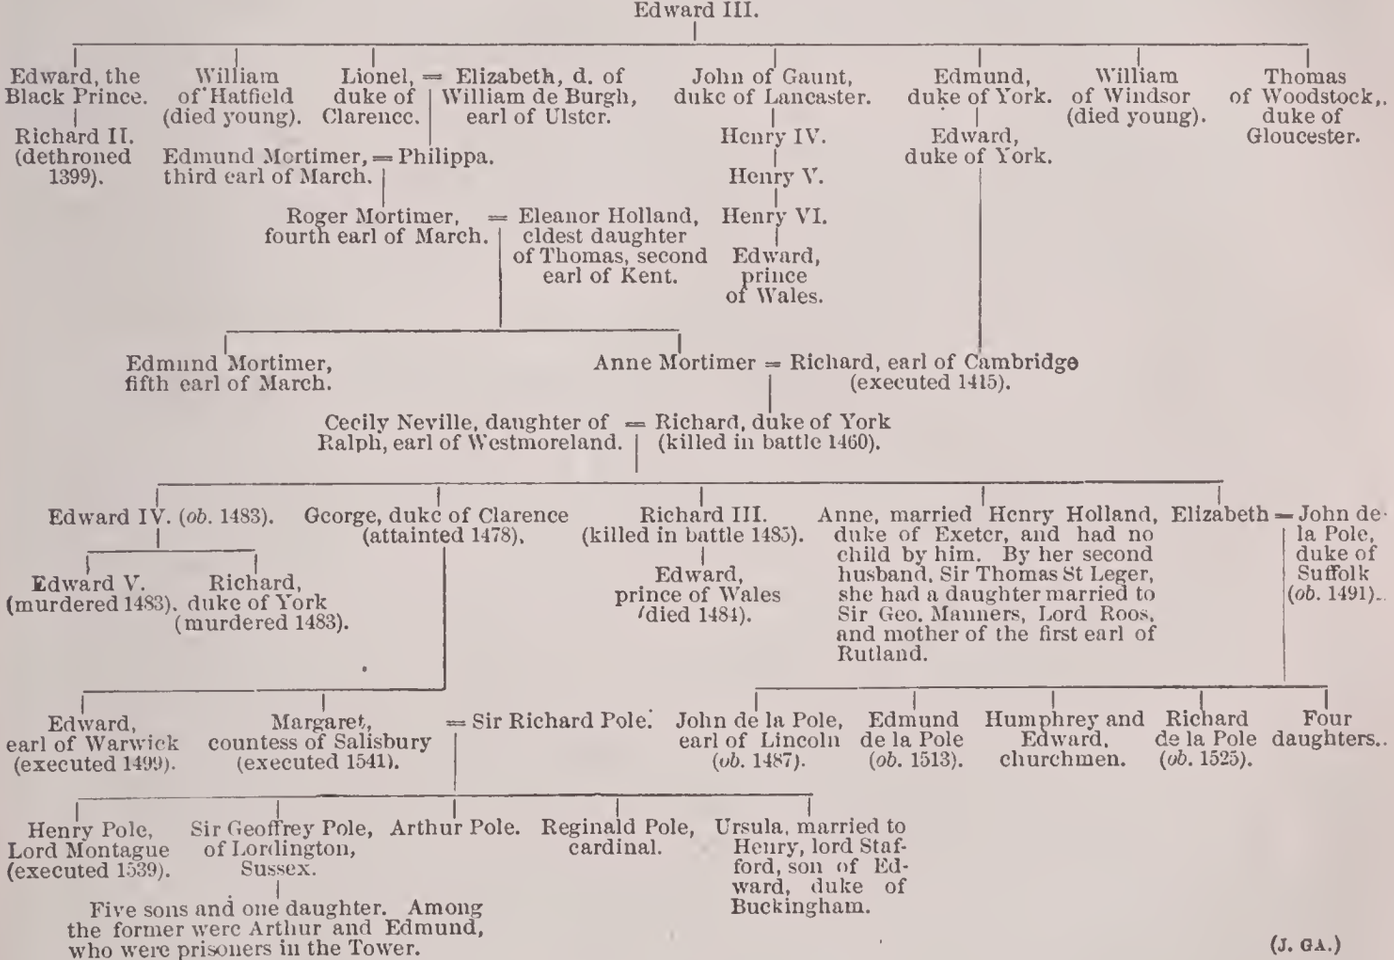
Here the dynastic history of the House of York ends, for its claims were henceforth merged in those of the House of Tudor. But the family history has still much to do with the story of those reigns. For, although the union of the Roses ought to have extinguished controversy, a host of debatable questions and plausible pretexts for rebellion still remained. The legitimacy of Edward IV.'s children had been denied by Richard III. and his parliament, and, though the Act was denounced as scandalous, the slander might still be reasserted. The duke of Clarence had left two children, a son and a daughter, and the attainder of their father could not be a greater bar to the crown than the attainder of Henry VII. himself. Seeing this, Henry had, immediately after his victory at Bosworth, secured the person of the son, who was named Edward, earl of Warwick, and kept him a prisoner in the Tower of London. Yet a formidable rebellion was raised in his behalf by means of Lambert Simnel, who, personating the prisoner in the Tower, professed to have escaped, went to Ireland, and after being actually crowned as king in Christchurch cathedral, Dublin, came over with a host of Yorkist sympathizers into England, where he was defeated and taken prisoner at the battle of Stoke in 1487. The earl of Warwick lived for twelve years later in unjust confinement, and was ultimately put to death in 1499 because he had consented to a plot for his own liberation. As to his sister Margaret, she was married to one of Henry VII.'s Welsh followers, Sir Richard Pole (or Poole), and could give no trouble, so that, when Henry VIII. came to the throne, he thought it politic to treat her with kindness. He made her countess of Salisbury, reversed her brother's attainder, created her eldest son, Henry, Lord Montague, and caused one of her younger sons, Reginald, who displayed much taste for learning, to be very carefully educated. This, however, was the very thing which involved the whole family in ruin. For Henry looked to the learning and abilities of Reginald Pole to vindicate before Europe the justice of his divorce from Catherine of Aragon; and, when Pole not only was unable to comply, but was conscientiously compelled to declare the very opposite, the king's indignation knew no bounds. Pole himself was safe, having secured some time before a retreat in Italy. He was even, for his great merits, made a cardinal by the pope. But this only made matters worse for his family at home: his brother, Lord Montague, and even his mother, the aged countess of Salisbury, were beheaded as traitors because they had continued to correspond with him. Cardinal Pole, however, came back to his own country with great honor in the reign of Queen Mary, and was made archbishop of Canterbury on the deprivation of Cranmer.

Two nephews of this cardinal, named Arthur and Edmund Pole, are the last members of the family whom it is needful here to mention. Early in the reign of Queen Elizabeth, being ardent young men, they conspired to go over to the duke of Guise in France, hoping to return with an army into Wales and so promote the claims of Mary Queen of Scots to the crown of England, for which service the elder, Arthur, expected to be restored to the dukedom of Clarence. The result was that they were condemned to death, but

were only imprisoned for the rest of their days in the Tower, where they both carved inscriptions on the walls of their dungeon, which are still visible in the Beauchamp tower.

There was yet another branch of the House of York which might have given trouble to the Tudors, if they had not been very narrowly watched and ultimately extinguished. Of the sisters of Edward IV. the eldest, Anne, who married the duke of Exeter, left only one daughter by her second husband, Sir Thomas St. Leger; but the second, Elizabeth, married John de la Pole, duke of Suffolk, and had several children of both sexes. Their eldest son was created earl of Lincoln during his father's life, and Richard III., after the death of his own son, had designated him as his successor. Disappointed of a kingdom by the success of Henry VII., he joined in Simnel's rebellion and was killed at the battle of Stoke. His brother Edmund thus became heir to his father; but in the reduced circumstances of the family he agreed to forbear the title of duke and take that of earl of Suffolk. He continued for some years in favor with the king, who made him a knight of the Garter; but having killed a man in a passion, he fled abroad and was for some time entertained at the court of the emperor Maximilian and afterwards of Philip, king of Castile, when resident in the Low Countries, before his departure for Spain. But Philip, having been driven on the English coast when going to take possession of his Spanish kingdom, was entertained at Windsor by Henry VII., to whom he promised to deliver up the fugitive on condition that his life should be spared. Edmund de la Pole accordingly was brought back to his native country, to be lodged in the Tower for the remainder of his days. And, though the promise to spare his life was kept by the king who gave it, his son Henry VIII. caused him to be executed in 1513, when war broke out with France, apparently for treasonable correspondence with his brother Richard, then in the French service. After his death Richard de la Pole, remaining in exile, called himself earl of Suffolk, and was flattered occasionally by Francis I. with faint hopes of the crown of England. He was killed at the battle of Pavia in 1525. There were no more De la Poles who could advance even the most shadowy pretensions to disturb the Tudor dynasty.

GENEALOGICAL TABLE OF THE HOUSE OF YORK.



(J. GA.)

YORUBA, or YARIBA, a country of West Africa, occupying the eastern half of the Slave Coast region in 6°–9° N. lat. and 3°–7° E. long. Taken in its widest sense, so as to include the whole domain of the Yoruba race and speech, the Yoruba country stretches from the Bight of Benin northwards in the direction of the unexplored region of Borgu, and from the ill-defined eastern frontier of Dahomey to the Niger and its delta, which enclose it on the northeast, east, and southeast. Within these limits it covers an area of at least 40,000 square miles, with a population roughly estimated at over 2,000,000. But since 1820–21, when the old Yoruba empire was broken up by the Fulah invaders, the northern part, comprised between the Niger and the water-parting of the streams flowing north to that river and south to the Gulf of Guinea, has been included in the Fulah state of Gando. This water-parting, which constitutes the main physical feature of the land, is formed by the eastern continuation of the mountain range which in the Mahi country, north of Dahomey, appears to rise to over 6000 feet (Skertchley), but which in Yoruba gradually falls to considerably under 2000 feet. But towards the east, about the upper course of the river Oshun, the system again rises to what is described as "a very mountainous country" (Higgins and Smith). The city of Ilorin, near the northern slope of the divide, stands at an elevation of a little over 1300 feet, which is probably about the average height of the range in Yoruba. Gerhard Rohlfs, who in 1867 traversed the whole region from Rabba on the Niger to Lagos on the Gulf of Guinea, describes the section north of the water-

parting as an open, gently sloping, and highly cultivated plain, to which the profusion of flowering plants gives the aspect of a vast garden. Here abundant crops of cereals, cotton, yams, ground-nuts, and kola nuts are raised. South of the divide the land, which is intersected by the nearly parallel courses of the rivers Ogun, Omi, Oshun, Oni, and Oluwa, falls in continuous undulations down to the coast, the open cultivated ground gradually giving place in the same direction to forest tracts, where the most characteristic tree is the oil-palm. Flowering trees and shrubs are here also plentiful, while the chief cultivated plants are corn, yams, plantains, bananas, tobacco, cotton, *okro*, ground-nuts, and *ata-ile* yielding a yellow dye (Higgins and Smith). As the sea is approached, the wooded tracts merge almost everywhere in a broad zone of dense primeval forest, completely separating the arable lands of the interior from the coast lagoons.

These lagoons, lying between the outer surf-beaten beach and the inner shore line, form a navigable highway of still waters, which in many places is several miles in extent. During the dry season the rivers discharging into the lagoons are unable to force a passage seawards; but after the rains they find an outlet, now at one point now at another, while here and there the natives themselves often excavate passages for their boats between the inner and outer waters. Of all the lagoons the most extensive are those of Leckie in the east and Ikoradu (Lagos) in the west. At its northern extremity the latter receives the discharge of the Ogun, the largest river in Yoruba, whose current is strong enough to keep the seaward channel open throughout the year. Hence the great importance of the British port of Lagos, which lies in smooth water at the inner entrance of this channel.

From Lagos, which, besides Badagry (about 40 miles farther west), is the only station actually occupied by England on this coast, the British Government exercises a sort of benevolent suzerainty over the whole of the Yoruba country. In 1886 it despatched to the inland tribes two commissioners (Higgins and Smith) for the purpose of bringing to a close the intertribal wars by which the country had for years been wasted, and also of inducing the chiefs to give up the practice of human sacrifices, which, as in Dahomey and Ashantee, though to a less degree, has always prevailed throughout this region. The commissioners obtained and embodied in their reports (*Blue Books*, 1887) a considerable amount of information regarding the present political and social condition of the Yoruba peoples. Since the dismemberment of their empire by the Fulahs (1820–21) the country has been divided into a number of semi-independent states, chieftaincies, or kingdoms, hanging loosely together, or rather constantly at war, and with a feeble sense of common nationality. The direct representative of the old Yoruba power is the "alafin" or king of the Yoruba country proper, occupying the northern and central parts of the whole region. Round about this central state are grouped the kingdoms of Ilorin, Ijesha, Ife, and Ondo in the east, Mahin and Jebu in the south, and Egba in the west. The alafin resides at Oyo, on a headstream of the Oshun, a place which as metropolis of the Yoruba nation has succeeded the older capitals, Bohu and Katunga, lying farther north and destroyed during the wars with the Fulahs. Oyo has an estimated population of 70,000 or 80,000; but it is greatly exceeded in size by several other places in Yoruba Land, where for mutual protection the inhabitants have mainly grouped themselves in large walled towns. Thus have sprung up the great cities of Abeokuta (200,000?), capital of Egba, on the Ogun, due north of Lagos; Ibádan (150,000), on a branch of the Omi, 30 miles south of Oyo; Ilorin (200,000?), one of the great markets of West Africa, capital of the Ilorin state; Ogbomosho (60,000), between Oyo and Ilorin; Ejigbo (40,000), Ilobu (60,000), and Ikirun (60,000), following successively nearly due east from Oyo; Ilesha (40,000), Oshogbo (60,000), and Ede (50,000), following each other due west in the Ilesha state; Ipetumodu (40,000), in Ife; Ode Ondo (60,000), capital of Ondo; Jebu Ode (60,000), Epe (40,000?), and Lagos (75,000), in the Jebu state and British protectorate. The constitution of some of these great urban groups is most remarkable. Thus Abeokuta, dating from 1825, owes its origin to the incessant inroads of the slave-hunters from Dahomey and Ibádan, which compelled the village populations scattered over the open country to take refuge in this rocky[1] stronghold against the common enemy. Here they constituted themselves a free confederacy of some sixty distinct tribal groups, each preserving the traditional customs, religious rites, systems of government, and even the very names, of their original villages. Yet this apparently incoherent aggregate has since held its ground successfully against the powerful armies often sent against the place both by the king of Dahomey from the west and by the people of Ibádan from the east. The different tribes are clearly distinguished by their several tattoo markings, usually some simple pattern of two or more parallel lines, disposed horizontally or vertically on both cheeks or other parts of the face.

Notwithstanding their political feuds, the Yoruba people are distinguished above all the surrounding races for their generally peaceful disposition, love of industry, friendliness, and hospitality towards strangers. Physically they resemble closely their Ewe and Dahomey neighbors, but are of somewhat lighter complexion, taller, and of less pronounced Negrô features. Their superior intelligence is shown in their greater susceptibility to Christian and Mohammedan influences, their capacity for trade, and their remarkable progress in the industrial arts. Although the bulk of the nation is still pagan, Islam has made great advancement since the cessation of the Fulah wars, while Protestant and Roman Catholic missions have been at work for many years at Abeokuta, Oyo, Ibádan, and other large towns. Samuel Crowther, the first Negro bishop, who was distinguished as an explorer, geographer, and linguist, was a native of Yoruba, rescued by the English from slavery and educated at Sierra Leone.

Although agriculture is the chief industry, such useful arts as pottery, weaving, tanning, dyeing, and forging are practiced in all the towns. The people make their own agricultural implements, extract a palatable wine from the *Raphia vinifera*, and weave a stout cotton fabric, which was formerly exported to Brazil, but which can now scarcely stand the competition of cheaper Manchester goods even in the home market. But as builders the Yorubas know no rivals in Negroland. The houses of the chiefs, often containing as many as fifty rooms, are constructed with rare skill, and tastefully decorated with carvings representing symbolic devices, fabulous animals, and even scenes of war or the chase.

Before the introduction of letters the Yorubas are said to have employed knotted strings, like the Peruvian quipus, for recording events of historic interest. Their language, which has been reduced to writing and carefully studied by Crowther, Bouché, Bowen, and other missionaries, is spoken with considerable uniformity throughout the whole of the Yoruba domain, and has even penetrated with the enterprising native traders as far east as Kano in the Haussa country beyond the Niger. The best-known dialectic varieties are those of Egba, Jebu, Ondo, Ife, Ilorin, and Oyo (Yoruba proper, called also Nago); but the discrepancies are slight, while the divergence from the conterminous linguistic groups (Ewe in the west, Ibo, Nupe, and others in the east) appears to be fundamental. The most marked feature is a strong tendency towards monosyllabism, which has been produced by phonetic decay, and which, as in the Indo-Chinese family, has given rise to the principle of intonation, required to distinguish words originally different but reduced by corruption to the condition of homophones. Besides the tones, of which there are three,—high, low, and middle,—Yoruba has also developed a degree of vocalic harmony, in which, as in Ural-Altaic, the vowels of the affixes are assimilated to that of the root. Inflection, as in Bantu, is effected chiefly by prefixes; and there is a remarkable power of word-formation by the fusion of several relational elements in a single compound term. The Bible and several religious treatises have been translated into Yoruba, which as a medium of general intercourse in West Africa ranks in importance next to Haussa and Mandingan.

(A. H. K.)

YOUGHAL, a seaport, borough, and market town in the county of Cork, Ireland, is situated on the west side of the estuary of the Blackwater, and on the Cork and Youghal branch of the Great Southern and Western Railway, 157 miles southwest of Dublin and 28 east of Cork. The fine collegiate church of St. Mary, in the Later Decorated style, was originally erected in the 11th century, but rebuilt in the 13th, and since that time it has been frequently repaired. It contains a fine monument to the first earl of Cork. There are still a few fragments of the Dominican

[1] Abeokuta = "under the rocks."

friary founded by Fitzgerald in 1269. Myrtle Grove, formerly the residence of Sir Walter Raleigh, still remains. The harbor is safe and commodious, and there are several good quays. At the northern extremity of the harbor the river is crossed by a bridge resting on wooden piles. The principal exports are corn and other agricultural produce; the imports are coal, culm, timber, and slate. Coarse earthenware and bricks are manufactured. There is a salmon fishery in the Blackwater. Youghal is of some repute as a watering-place. The population of the town (area 345 acres) in 1871 was 6081, and in 1881 it was 5826.

Youghal is one of the most ancient towns in Ireland, and was incorporated by King John in 1209. The Franciscan monastery, founded at Youghal by Fitzgerald in 1224, was the earliest house of that order in Ireland. Sir Roger Mortimer landed at Youghal in 1317. The town was plundered by the earl of Desmond in 1579. In 1641 it was garrisoned and defended by the earl of Cork. In 1649 it declared for the Parliament. It sent two members to Parliament from 1374 till the union, after that only one down to 1885, when it was for parliamentary purposes merged in the East Division of the county.

YOUNG, Arthur (1741–1820), a writer on agriculture and social economy, the third son of Rev. Arthur Young, rector of Bedingfield, in Suffolk, was born on 7th September, 1741. After having been for some time at a school at Lavenham, he was in 1758 placed in a mercantile house at Lynn, but showed no taste for commercial pursuits. He gave early evidence of literary inclinations by publishing, when only seventeen years old, a pamphlet *On the War in North America* and by beginning a periodical work, entitled *The Universal Museum*, which, however, was soon dropped by the advice of Dr. Samuel Johnson.

After his father's death in 1759, his mother gave him the direction of Bradfield Hall; and in 1767 he undertook on his own account the management of a farm in Essex. Possessing no practical acquaintance with agriculture, but being active-minded and of an inquiring turn, he engaged in experiments of various kinds, and embodied the results of them in *A Course of Experimental Agriculture*, which appeared in 1770. Though Young's experiments were, in general, unsuccessful, he acquired in the process of making them a solid knowledge of agriculture; and, writing in a lively style, he was able to make his disquisitions on the subject interesting to the public. He had already commenced a series of journeys through different parts of England and Wales, and gave an account of his observations in books which appeared from 1768 to 1770—*A Six Weeks' Tour through the Southern Counties of England and Wales*, *A Six Months' Tour through the North of England*, and the *Farmer's Tour through the East of England*. He says that these books contained the only extant information relative to the rental, produce, and stock of England that was founded on actual examination. They were very favorably received at home and abroad, being translated into most Continental languages by 1792.

In 1768 he published the *Farmer's Letters to the People of England*, in 1771 the *Farmer's Calendar*, which has gone through a great number of editions, and in 1774 his *Political Arithmetic*, which was soon translated into several foreign languages. About this time Young acted as parliamentary reporter for the *Morning Post*. He made a tour in Ireland in 1776, and drew up the results, with copious observations on the state of that kingdom, in the years 1776–79, publishing a quarto volume on them in 1780. In 1784 he commenced the publication of the *Annals of Agriculture*, which was continued for 45 volumes; this work had contributions from many authors, among whom was George III., writing under the *nom de plume* of Ralph Robinson. Young's first visit to France was made in 1787. In May of that year he went to join Rochefoucauld-Liancourt at Paris, and accompanied by him and another gentleman travelled south to Bagnères de Luchon, making also an excursion into Spain. In November he was again in London; but in July, 1788, he returned to France to study at leisure what he had before cursorily observed. He then saw the western part of the country, travelling alone on horseback, and came back a third time to see the east. The motive of these visits was "to make himself a master of their agriculture, that if he found anything good and applicable to England, he might copy it." But he had an eye no less for political and social phenomena, and, traversing France in every direction just before and during the first movements of the Revolution, he has given us interesting and valuable notices of the condition of the people and the conduct of public affairs at that critical juncture. The *Travels in France* appeared in two vols. 4to in 1792. On his return home he was appointed secretary of the Board of Agriculture, then just formed under the presidency of Sir John Sinclair. In this capacity he gave the most valuable assistance in the collection and preparation of agricultural surveys of the English counties. In 1765 he had married a Miss Allen; but the union is said not to have been a very happy one, though he was of domestic habits and a most affectionate father. His sight failed, and he submitted to an operation for cataract, which proved unsuccessful. He suffered also in his last years from stone. He died in February, 1820.

"To the works of Arthur Young," said Kirwan, "the world is more indebted for the diffusion of agricultural knowledge than to any writer who has yet appeared." To the same effect is the more recent testimony of Mr. Hoskyns, who tells us that "the *Farmer's Letters* and *Calendar*, as well as the *Tours*, displayed the mind and pen of a master in his art, and went far towards laying the foundation of a practical agricultural literature." But it is as a social and political observer that Young is now best known to the reading public, and the books which have established his reputation in these departments—his *Tour in Ireland* and *Travels in France*—are still full of interest and instruction.

He found that Ireland had "flourished for the last thirty years to an uncommon degree, more," he believed, "than any country in Europe;" and he protested against the turbulence of the population and the outcries of the gentry at a time when Ireland had "experienced more favor from three sessions of a British parliament than from three centuries before." But he saw clearly and exposed unsparingly the causes which retarded the progress of the nation. He strongly urged the repeal of the penal laws which pressed upon the Catholics; he thought, however, that their disabilities should be removed, not by a single measure, but gradually. He protested against the harshness with which the laboring classes were treated by their superiors, and denounced the middlemen as being, not merely a useless class, but by their oppression and insolent manners the chief causes of popular discontent. He condemned the restrictions imposed by Great Britain on the commerce of Ireland, and also the perpetual interference of the Irish parliament with industry by prohibitions and bounties; of the latter he censured in specially strong terms the bounty on the inland carriage of corn to Dublin. He deplored the drain of rents and the neglect of their tenantry by absentee proprietors. The state of agriculture, generally low though improving, he found particularly unsatisfactory in Ulster, owing to the prevalence there of the linen manufacture, at that time carried on in the homes of the people, who were constantly divided between this occupation and the labors of the field. Emigration, he thought was not sufficiently encouraged; indeed it scarcely existed at the period of his visit. It had previously been practiced to a greater extent, and, besides relieving the population which remained, had been useful in removing restless spirits who would have been troublesome at home. He favored a legislative union of Ireland with Great Britain, though he did not regard such a measure as absolutely necessary, many of its advantages being otherwise attainable, without incurring the risk of some possible inconveniences.

The soil of France he found in general superior to that of England, and its produce less. Agriculture was neither as well understood nor as much esteemed as in England. He severely censured the higher classes for their neglect of it. "Banishment (from court) alone will force the French nobility to execute what the English do for pleasure—reside upon and adorn their estates." Young saw the commencement of violence and outrage in the rural districts, being

himself more than once in peril from popular suspicion. His sympathies began to take the side of the classes suffering from the excesses of the Revolution, and this change of attitude was distinctly shown by his publication in 1793 of a tract entitled *The Example of France a Warning to England*. Of the profounder significance of the French outbreak, as the commencement of a world-wide movement and a new era in social history, he seems to have had little idea, and thought the crisis would be sufficiently met by a constitutional adjustment in accordance with the English type. Yet he had much of the feeling which then inspired the Revolutionary actors, and, along with it, it may be added, something of the general sentimentalism of the period. Another enthusiasm he frequently exhibits—namely, for music, and especially for the Italian opera. But his master passion was the devotion to agriculture, which constantly showed itself. He strongly condemned the *métayer* system then widely prevalent in France, as "perpetuating poverty and excluding instruction," as, in fact, the curse and ruin of the country. Some of his phrases have been often quoted by the advocates of peasant proprietorship as favoring their view. "The magic of property turns sand to gold." "Give a man the secure possession of a bleak rock, and he will turn it into a garden; give him a nine years' lease of a garden, and he will convert it into a desert." But these sentences, in which the epigrammatic form exaggerates a truth, and which might seem to represent the possession of capital as of no importance in agriculture, must not be taken as conveying his approbation of the system of small properties in general. He approved it only when the subdivision was strictly limited, and even then with great reserves; and he remained to the end what J. S. Mill calls him, "the apostle of *la grande culture*." The French acknowledge the valuable services which his criticisms and counsels rendered to their agriculture. The directory in 1801 ordered his writings on the art to be translated and published at Paris in 20 volumes under the title of *Le Cultivateur Anglais*. His *Travels in France* were translated in 1793-94 by Soulès; and a new version by M. Lesage, with an introduction by M. de Lavergne, appeared in 1856. An interesting review of the latter publication, under the title of *Arthur Young et la France de* 1789, will be found in M. Baudrillart's *Publicistes Modernes*, 2d ed., 1873.

(J. K. I.)

YOUNG, Brigham (1801–1877), Mormon president, was born in Whitingham, Vermont, on 1st June, 1801. His father was a farmer, and he himself learned the trade of a painter and glazier. He originally belonged to the Baptist Church, but joined the Mormons at Kirtland, Ohio, in 1832. In the same year he was ordained "elder;" in 1835 he was made an apostle; and in 1844 he succeeded Joseph Smith as president. He died at Salt Lake City on 29th August, 1877. See Mormons.

YOUNG, Edward (1681–1765), author of *Night Thoughts*, was born at Upham, near Winchester, in 1681.[1] The minute facts of his life are to be found in the biography contributed to Johnson's *Lives of the Poets* by Herbert Croft. The son of the dean of Sarum, educated at Winchester and Oxford (New College and Corpus), Young obtained a law fellowship at All Souls in 1708, and proceeded to use it as a base of operations for gratifying his "ruling passion," the love of fame. There was at the time an open career for young men of talent who showed ability to recommend the policy and the persons of statesmen in their struggle for power, and Young, full of unbounded energy and eloquence, exuberant to eccentricity, joined in the race with a vigor that soon raised him to distinction. He seems to have been for a time in the family of the earl of Exeter as tutor; but the notorious marquis of Wharton (see Wharton) took a fancy to him, bribed him away from this post with liberal promises of maintenance and patronage, settled two annuities on him, and tried to get him into Parliament. Meantime Young began to publish and to dedicate, the poems and the dedications taken together (*The Last Day*, 1713, and *The Force of Religion*, 1714) showing the simple mixture of piety and worldliness that is one of the notes of his character. He essayed tragedy, writing at mid-day with closed shutters, by the light of a candle fixed in a human skull. *Busiris* was performed at Drury Lane in 1719, *The Revenge* in 1721. Far from gloomy in the company of Wharton and his friends, he had a decided bent for gloomy themes when alone, and a most copious and lofty—often extravagantly lofty—eloquence in the treatment of them; a paraphrase of the book of Job was one of his productions about this time. But he showed equal facility in dashing and effective satire: his first great literary success was made with the series of satires published between 1725 and 1728, and collected in the latter year under the title *Love of Fame, the Universal Passion*. These satires do not bear comparison with Pope's, to which they pointed the way, but they have a charm of exuberant vitality and power, an irregular abundance of wit and bold imagery, a frequent felicity of diction, that entitle them to Johnson's praise—"a very great performance"—and enable us to understand the impression produced by Young in conversation. One of the features in Young's character that disarms resentment of his fulsome adulation, and other extravagances and eccentricities, is his humorous Falstaffian consciousness of his own faults. "Who can write the true absurd like me?" he cries in one of his satires. He abundantly proved this in *Ocean: an Ode*, with which he hailed the accession of George II. Soon after, when nearly fifty, he took orders, was appointed a royal chaplain, and presented by his college to the rectory of Welwyn. He was disappointed in his desire of further promotion in the church; he had succeeded some time before in extracting a pension of £200 [$972] from Walpole, and this favor was cynically treated as a satisfaction in full of his claims on the Government. The *Night Thoughts* were published in separate "Nights" between 1742 and 1744. In the preface Young said that "the occasion of this poem was real, not fictitious, and that the facts mentioned did naturally force these moral reflections on the mind of the writer." Croft has shown that this statement, though justifiable in the main, has to be taken with some qualifications, and that a common belief that Lorenzo was meant for the author's own son was undoubtedly a mistake. Still, it is true that Young's wife, her daughter, and her daughter's husband died in rapid succession, and the poem—a great work in spite of all its inequalities—was, like *In Memoriam*, the expression of a real sorrow and search for consolation. Young continued to write occasionally even after he had passed his eightieth year. His death took place on 12th April, 1765.

Besides Croft's *Life*, there are interesting references to Young in Boswell's *Johnson* (see Birkbeck's ed., iv. 119, v. 270).

YOUNG, Thomas (1773–1829), one of the most remarkable figures alike in literature and science in the beginning of the 19th century in Great Britain. He belonged to a Quaker family of Milverton, Somerset, and was the youngest of ten children, having been born on 13th June, 1773. His precocity, especially in the acquirement of languages, was remarkable, being little inferior to that of Sir W. Rowan Hamilton. But his thirst for knowledge was unlimited in its range. He was not content with languages, mathematics, and physical science: natural science, medicine, and even ancient philosophy were eagerly studied by him; and he was passionately devoted to athletic exercises. His medical studies were pursued successively in London, Edinburgh, Göttingen, and finally at Emmanuel College, Cambridge, where he took his doctor's degree. The death of a maternal uncle put him in a position of comfortable independence, and he did not heartily enter upon practice. He was secured in 1802 by the Royal Institution as a colleague of Davy and professor of natural philosophy. Here his special talents found ample occupation, and the chief result was the publication in 1807 of his celebrated *Course of Lectures on Natural Philosophy*, a work which is even now regarded as a valuable authority. Some years before he

[1] [The current date of 1684 in many works of reference is not borne out in Johnson's *Lives of the Poets*, and is to be discarded.—Am. Ed.]

had made his remarkable discovery of the interference of light, and begun that wonderful series of researches which, as completed by Fresnel, secured the triumph of the undulatory theory. He was foreign secretary of the Royal Society for more than a quarter of a century; and it is curious to note that his reputation stood higher in foreign than in home scientific circles. He was one of the eight foreign associates of the Institute of France. He was one of the Commissioners of Weights and Measures, and secretary to the Board of Longitude, which in those days conducted the *Nautical Almanac*. A few years before his death he became interested in life assurance, with great benefit to the company whose scientific business he conducted. His death, on 10th May, 1829, was probably hastened by the extraordinary amount and variety of the labors he undertook, and the self-sacrificing zeal with which he devoted himself to them.

His *Life*, by Dr. Peacock, dean of Ely and a well-known mathematician, was published in 1855, along with a collection of his *Miscellaneous Works* and *Scientific Memoirs*. Young was a somewhat copious contributor to the 6th edition of this *Encyclopædia*, and some of the best of his smaller papers appeared in it for the first time. For a résumé of his contributions to the subject of hæmadynamics, see VASCULAR SYSTEM, p. 105 *supra*. Another of the multitudinous problems that claimed his attention was the decipherment of the Egyptian hieroglyphics, in which he had made some progress as early as 1814; see his *Account of some Recent Discoveries in Hieroglyphical Literature* (London, 1823).

YOUNGSTOWN, a city and the county seat of Mahoning county, Ohio, United States, is situated upon the Mahoning river a tributary of the Ohio. The prevailing industries of the surrounding country are agriculture and coal-mining. Youngstown is directly connected with six railway lines. Owing to the contour of the site, the city is laid out very irregularly. The population in 1880 was 15,435 (8075 in 1870). The industries of Youngstown are connected chiefly with the manufacture of iron; there are several furnaces and rolling-mills, and manufactories of rails and stoves and of agricultural tools and machines.

Youngstown was laid out in 1797, being one of the first settlements made in that part of Ohio known as the Western Reserve. Since it became the county-seat in 1874 it has grown with great rapidity.

YPRES (Flem. *Yperen*), a town of Belgium, capital of an arrondissement in the province of West Flanders, stands in a fertile plain on the Yperlee, 21 miles north-northwest of Lille. In the 14th century it is said to have contained 200,000 inhabitants; and it was long famous for its woollen and linen manufactures, though the once current derivation of the word "diaper" from the name of this town can no longer be maintained. Of the old fortifications some traces still remain, as well as a few picturesque dwelling-houses of the 14th and 15th centuries. The fine Gothic cloth hall (1201–1342), with a façade 462 feet in length, is pierced by two rows of pointed windows; there are two corner turrets; and in the centre rises a massive square clock tower. The forty-four statues of counts of Flanders and their consorts which formerly adorned it were restored in 1860. The town-hall (1730) contains some interesting frescos and sculptures of modern date. The finest parts of the Gothic cathedral of St. Martin (1221–1270) are the choir, and the portal and rose window of the south transept; in the interior is some good wood-carving; the old frescos were "restored" in 1826. In the cloister is the tomb of Cornelius JANSEN (*q.v.*). The town contains several other churches as well as hospitals, a military school, a museum, and a public library. The chief manufactures are those of linen thread and lace and of woollen and linen cloth; dyeing, bleaching, and tanning are also carried on. The population in 1876 was 15,515.

YRIARTE. See IRIARTE.

YTTRIUM, the name of a rare element which in its character is closely allied to, and in nature is always associated with, cerium, lanthanum, didymium, and erbium (see LANTHANUM, vol. xiv. p. 292). For the preparation of yttrium compounds the best raw material is a rare Swedish mineral called gadolinite, which, according to König, consists of 22.61 per cent. of silica, 34.64 of yttria, Y_2O_3, and 42.75 of the oxides of erbium, cerium, didymium, lanthanum, iron, beryllium, calcium, magnesium, and sodium. Bunsen and Bahr, in 1866, elaborated a method for extracting the several rare oxides in the state of purity; but the method is too complicated to reproduce here.[1] Metallic yttrium is obtainable by reducing the chloride with potassium; but this operation has never been carried out with pure chloride. Yttria, Y_2O_3, is a yellowish white powder, which at high temperatures radiates out a most brilliant white light. It is soluble, slowly, but completely, in mineral acids. It is recognized most surely by its very characteristic spark spectrum. Solutions of yttria salts in their behavior to reagents are not unlike those of zirconia. The atomic weight of yttrium, according to the latest researches,[2] is 89.02, if O = 16.

YUCATAN, a peninsular region of Central America, forming the southeastern extremity of Mexico (see vol. xvi. pl. I.), of which, since 1861, it constitutes the two confederate states of Campeche (Campeachy) in the west and Yucatan in the east. At its neck the peninsula is conterminous on the southeast with British Honduras, on the southwest with the state of Tabasco (Mexico), and on the south with the republic of Guatemala, the boundaries towards these territories being largely of a purely conventional character. From this base the land projects in a compact rectangular mass between the Gulf of Mexico and the Caribbean Sea, west and east, for 280 miles northwards, across nearly four degrees of latitude (18° to 21° 40′ N.) and three of longitude (87° 30′ to 90° 30′ W.), to within 120 miles of Cuba, from which it is separated by the Yucatan Channel. It has a mean breadth of about 200 miles, a coast-line of 700 miles, and a total area of 55,400 square miles, with a population in 1882 of 393,000 (Yucatan, 29,570 square miles, population 302,500; Campeche, 25,830 square miles, population 90,500).[3] Boundaries, area, etc.

The coast line presents a uniform monotonous aspect, being fringed by no islands except Cozumel near the northeast point, and broken by no indentations except the shallow Lake Terminos on the west and the inlets of Ascension, Espiritu Santo, and Chetumal Bays on the east side. But the north coast is skirted by an almost continuous line of low dunes, nearly 200 miles long, enclosing a broad lagoon, which varies in length and depth with the seasons. Behind the lagoon a bed of coralline and porous limestone rocks, composing nearly the whole tableland of Yucatan, rises continuously southwards in the direction of the Sierra Madre, which, beyond the frontier, traverses the whole of Guatemala and Central America. Geologically, Yucatan thus presents the character of a comparatively recent formation, built up by polypi in shallow waters, and gradually covered with a layer of thin dry soil by the slow weathering of the coral rocks. But the surface is not so uniformly level and monotonous as it appears on most maps; for, although there are scarcely any running streams, it is diversified here and there by a few lacustrine basins, of which Lakes Bacalar and Chicankanah are the largest, as well as by some low isolated hills and ridges in the west, and on the east side by the Sierra Alta, a range of moderate elevation, traversing the whole peninsula from Catoche Point southwards to the neighborhood of Lake Peten in Guatemala. Physical features.

[1] See the handbooks of chemistry and the original memoir in Liebig's *Annalen*, vol. cxxxvii. p. 1.
[2] Cleve, *Jahresber. der Chemie*, 1882, p. 15.
[3] Previous estimates assigned 32,650 square miles to Yucatan and 26,100 to Campeche.

There are thus no elevations sufficiently high to intercept the moisture-bearing clouds from the Atlantic, while those from the Pacific are cut off by the Sierra Madre. Hence the climate is necessarily dry, with a deficient and uncertain rainfall, especially in the central and northern districts. Here also the tropical heats are intensified by the neighborhood of the Gulf Stream, which in its passage through the Yucatan Channel flows much nearer to the coast of the peninsula than to that of Cuba. Still, the climate, although "hot of the hottest" (Ober), with a temperature ranging from 75° to 98° Fahr. in the shade, is comparatively healthy, owing to its great dryness and to the cool breezes which prevail night and day throughout a great part of the year. The atmosphere is also occasionally purified by the fierce *temporales* or "northers," which sweep across the Gulf freely over this open low-lying region. Yellow fever, however, periodically visits the Campeche coast, while ague is endemic in the undrained swampy districts towards the southern frontiers. Like most regions lying entirely within the tropics, Yucatan has two seasons only, which are determined by the alternations not so much of temperature as of atmospheric moisture. The dry season lasts from October to May, the wet season for the rest of the year; the hottest months appear to be March and April, when the heat is increased by the burning of the corn and henequen fields on the plateau.

Climate.

All the northern districts, as well as the greater part of the Sierra Alta, are destitute of large trees; but the coast-lands on both sides towards Tabasco and British Honduras enjoy a sufficient rainfall to support large forest growths, including the mahogany tree, several valuable cabinet woods, vanilla, logwood, and other dye-woods. Logwood forests fringe all the lagoons and many parts of the seaboard which are flooded during the rainy season. The chief cultivated plants are maize, the sugar-cane, tobacco, cotton, coffee, and especially henequen, the so-called Yucatan hemp or Sisal hemp, which, however, is not a hemp at all, but a true fibre. It is yielded by *Agave sisalensis*, which grows everywhere, and is used chiefly for the manufacture of coarse sackcloth, cordage, and hammocks. In 1880 as much as 40,000,000 lb of this article, valued at £350,000 [$1,701,000], was shipped at Progreso. The yearly maize crop is estimated to be worth over £1,000,000 [$4,860,000], and the whole of the agricultural produce about £2,000,000 [$9,720,000]. But a comparatively small area is under tillage, owing largely to the prevailing system of vast haciendas (estates), which the owners have neither the necessary capital nor the energy to administer. Hence symptoms of decay are everywhere visible; the whole country is "mainly a wilderness" (Ober); and there is probably much less land under cultivation than at the time of the Spanish conquest.

Vegetable productions.

Of the state of Yucatan the capital is Merida (40,000 inhabitants in 1882), which is connected with its port of Progreso, on the northwest coast, by a railway 25 miles long, the only line in the country. The state of Campeche has for its capital the town and seaport of the same name (16,000), on the west coast. Other towns in the peninsula are Tikul, Ixmal, and Valladolid in Yucatan, and the port of El Carmen on an island in Lake Terminos in Campeche. According to the official returns, there are at present (1888) in Yucatan altogether 7 "cities," 13 towns, and 143 villages, besides 15 abandoned settlements and 333 haciendas. But scarcely any of these places have as many as 10,000 inhabitants, while the population of the great majority falls below 1000.

Towns.

The contrast is most striking between the picture conveyed by these returns, which also include 62 "ruined cities," and the state of the country at the time of the Spanish conquest, as revealed by the innumerable remains of towns, cities, temples, palaces, and other public buildings dotted over the plateau, being especially numerous round the now desolate northern and northeastern shores of the peninsula. The whole of the northern section of Yucatan, which is now destitute alike of running waters, of dense vegetation, and almost of inhabitants, was at that time thickly peopled and full of populous cities remarkable for the great size, splendor, and artistic taste of their public monuments. For Maya, as the land was then called,[1] was the chief centre of the wide-spread Maya-Quiché power and culture, which rivalled, and in some respects excelled, those of the Peruvian Incas and of the Aztecs on the Anahuac plateau. Although the Maya nation had at that time already entered on a period of decadence, it was still strong and vigorous enough to resist the conquistadores for a period of fully twenty years (1527–47), the reduction of this barren region costing "the lives of more Spaniards than had been expended in wresting from the Incas and the Montezumas the wealthiest empires of the western world" (Bancroft).

Condition at Spanish conquest.

Wonder has been expressed that such a bleak, arid, and almost streamless land could have ever become the seat of empire and the home of a flourishing civilization. But the absence of rivers on the plateau appears to be due not so much to the deficient rainfall as to the extremely porous nature of the calcareous soil, which absorbs the waters like a sponge and prevents the development of surface streams. Beneath the surface, however, the waters accumulate in such abundance that a sufficient supply may always be had by sinking wells in almost any part of the tableland. What the present inhabitants neglect to do was systematically practiced by the former populations, whose aguadas or artificial lakes and underground reservoirs must be reckoned amongst the most remarkable monuments of Maya culture. "Intelligence, much skill in masonry, and much labor were required to construct them. They were paved with several courses of stone laid in cement, and in their bottoms wells or cavities were constructed. More than forty such wells were found in the bottom of one of these aguadas at Galal, which has been repaired and restored to use. In some places long subterranean passages lead down to pools of water, which are used in the dry season. One of these subterranean reservoirs is 450 feet below the surface of the ground, and the passage leading to it is about 1400 feet long" (Baldwin, p. 145). Thus the Mayan, like the Peruvian, the Egyptian, and the Babylonian culture, was based on a well-planned and carefully executed system of waterworks, specially adapted to the peculiar physical conditions of the country.

Mayan irrigation works.

The monumental remains which must be assigned to the Maya-Quiché, as distinguished from other native civilizations, are spread over a great part of Central America, but are mainly comprised within the triangular space formed by connecting Mitla in Oajaca, Copan in Honduras, and the north coast of Yucatan above Tizimin by three straight lines. But of the "sixty-two ruined cities" of Yucatan proper the most important, or at least the best known and most fully described, are Izamal, Mayapan, Aké, Acanceh, Uxmal, Tikul and Kabah, all centred in the northwest corner of the peninsula round about Merida, which itself stands on the ruins of Tihu; Chichen-Itza, about midway between Tikul, and the east coast; and Labná, Nohbecan, and Potonchan in the Campeche district. Most of these places were described and illustrated by Stephens and Catherwood over forty years ago, and have recently been revisited and redescribed by M. Désiré Charnay. The structures especially of Uxmal, Aké, Kabah, and Chichen-Itza rival in magnitude and splendor those of Palenque in Chiapas, of Coban and Lorillard (the "Phantom City") in Guatemala, and of Copan in Honduras. There is nothing comparable to them on the Mexican tableland, and in the New World they are surpassed in architectural skill and artistic taste only by the beautiful edifices at Mitla in Oajaca and some of the monuments of Peruvian culture.

Ruined cities.

Mayapan ("El Pendon de los Mayas," or "Banner City of the Maya Nation") was already in ruins at the time of the conquest, having been overthrown during a general revolt of the feudatory states about a century before that period.[2] Yet its ruins, overgrown with vegetation, still cover a considerable space, and include a huge artificial mound which from a distance looks like a wooded hill. But Uxmal stands altogether unrivalled for the magnitude of its buildings, the richness of its sculptured façades, and the almost classic beauty of its statuary. Conspicuous amongst its edifices are the so-called "nunnery" and the famous Casa del Gobernador or governor's palace, the latter with a wonderful frieze, 325 feet long, "having a row of colossal heads divided in panels, filled alternately with grecques in high relief" (Charnay). The nunnery, which contained eighty-eight compartments of all sizes, forms a vast quadrangle, with one front 280 feet long and enclosing a court 258 by 214 feet. Here Dr. Le Plongeon discovered in 1881 a surprisingly beautiful statue, surpassing anything of the kind ever found in Central America. But this object he again carefully hid away to prevent it from falling into the

Mayapan.

Uxmal.

[1] Yet the term *Yucatan* occurs in the very earliest Spanish records, although clearly originating in a misunderstanding, of which several versions are given by Bancroft (*Hist. Pacific States*, iv. p. 11). It appears even on the very oldest maps, on which, however, the country figures as an island, and is spoken of as such in conjunction with Cozumel ("the islands of Yucatan and Cozumel") in the commission (1526) granted to Francesco Montejo the elder to occupy and settle those lands (*op. cit.*, i. p. 154).

[2] Or, according to other interpretations of the confused national traditions, by the people of Chichen-Itzá, some three centuries before the arrival of the Spaniards.

hands of the Mexican authorities, who had seized another remarkable statue previously brought to light by this industrious explorer (Ober).

Aké. Conspicuous amongst the crumbling monuments of Aké, which lies ten leagues east of Merida, is a huge pyramid, with an immense flight of steps, presenting some extraordinary features different from anything elsewhere discovered in Yucatan. This strange monument is surmounted by thirty-six pillars (twenty-nine still standing), each 4 feet square and from 14 to 16 feet high, disposed in three parallel rows 10 feet apart, the whole supported by a platform 212 feet by 46 and approached by

Izamal. steps from 4½ to 6½ feet long and from 1 to 1½ feet high. At Izamal, a few miles east of Aké, stands another great pyramid, with a base of nearly 650 feet, besides three others, and a colossal head 13 feet high, not, however, a monolith, but built up of rough stones coated with mortar. But the gigantic face described and reproduced by Stephens had disappeared at the time of Charnay's visit to Izamal.

Chichen-Itza. To this explorer we are indebted for the first detailed account of the wonderful remains of Chichen-Itza, which include another nunnery, a tennis-court, several temples, and other buildings profusely embellished with rich friezes, statues, pillars, reliefs, and the like, the whole grouped round a central pyramid of great size, known as the Castillo, from the beautiful structure still standing on its summit. Chichen-Itza, which was certainly inhabited at the time of the conquest, was the capital of the Itzaes, one of the most powerful Maya nations, who appear to have afterwards migrated southwards to the neighborhood of Lake Peten, where tribes of this name are still found. They constituted one of the eighteen semi-independent Maya states, whose incessant internecine wars at last brought about the dismemberment of the once potent theocratic empire of Xibalba (Palenque?) and the destruction of the Maya civilization.

Kabah. Scarcely less important than those of Chichen-Itza are the monuments of Kabah, which lies about 12 miles south of Uxmal. The two places were formerly connected by a plastered causeway, traces of which are still visible, and Kabah must have been a very large city, for its ruins are scattered over a considerable area. Amongst them are comprised lofty pyramids, vast terraces, and sumptuous palaces or temples, with elaborate ornamentation, sometimes almost completely disguising the architectural features of the edifices.[1] Charnay mentions "triumphal arches," but adds that he sought in vain for the unique specimen of this kind of monument in America which is mentioned and figured by Stephens, and which bears such a striking resemblance to the triumphal arches of the Roman type. Many other remains have either disappeared or crumbled away almost beyond recognition since they were first sketched by Catherwood.[2] But, on the other hand, numerous buried cities and monuments probably still remain concealed amid the rank tropical vegetation, especially in the almost unknown territory of the unreduced Lacandons and Itzaes towards the Guatemala frontier. But enough has already been surveyed fully to justify Maudslay's general remark, that Yucatan is thickly covered with the ruins of great buildings "even superior in some respects to those found in other parts of Central America."

Inscriptions. Like those of Palenque, Lorillard Town, Tikul, and Copan, many of these buildings are covered with inscriptions, the key to the deciphering of which has not yet been discovered. Notwithstanding certain divergences, seen especially at Lorillard, all belong obviously to the same writing system. But whether that system is purely ideographic, phonetic, or intermediate cannot be asserted with any certainty, although Holden, who has attacked the problem from a fresh standpoint, declares emphatically that they are not phonetic, "except in so far as their rebus character may make them in a sense phonetic." He claims by his system to have fixed the order in which the inscriptions are to be read (in lines left to right, in columns vertically downwards), and fancies he has determined the meaning of three characters representing Maya divinities. But Holden is ignorant of the Maya-Quiché language, of which a few manuscripts have been rescued from the fury of the early Spanish iconoclasts. One of these documents, the *Popol-Vuh*, written or copied about 1558 from an older Quiché book, has been edited and even translated by Brasseur de Bourbourg. This uncritical writer makes use of a so-called Maya-Quiché alphabet preserved by Diego de Landa, first bishop of Yucatan, in his *Relacion* or history of the Mayas. But the alphabet in question is admittedly extremely defective and inadequate to interpret the native writings, and has even been pronounced "a Spanish fabrication" by Dr. Valentini,[3] a view which Holden appears to endorse. The puzzle thus remains still unsolved, and no safe inference can be drawn beyond the fact that the inscriptions and manuscripts are composed in a highly conventional form of writing, and probably in more than one Maya-Quiché dialect.

Origin and antiquity of Maya culture. Other difficult questions connected with the origin and antiquity of the Maya culture, and the nature of its relations to that of Mexico, will be found discussed under MEXICO (*q.v.*). But, since that article was written, fresh materials have been collected and published which help to throw some further light on these obscure subjects. Unfortunately M. Charnay, who since the time of Stephens and Catherwood has undoubtedly contributed most to our knowledge of the Central-American remains, has revived in an exaggerated form the old views of Morelet, Orozco y Berra, and others regarding the Toltec origin of all these monuments. This observer sees everywhere the clearest evidences, not merely of Toltec influences, which are obvious enough, but of the Toltec institutions themselves, of the Toltec religion, architecture, and civilization, to the exclusion of all others in Central America. He even boldly traces on the map the lines of a twofold Toltec migration, from Tula along the Atlantic and from Toluca along the Pacific side, to their junction at Copan in Honduras, some few centuries before the discovery of the New World. But our faith in the soundness of these views is greatly shaken when we find M. Charnay identifying the Toltecs themselves somewhat wildly with Malays, Indo-Chinese, and other Asiatic races. Some of the present populations of Yucatan are even pronounced to be "a cross between the Malay and the Chinese," and all the exploded theories are thus revived of an Asiatic origin of the civilized inhabitants of the New World and of their cultures. But, as Ober well remarks, the evidence is cumulative in favor of the independent evolution of these cultures. Late contact,—that is, contact since the remote Stone Age,—with the inhabitants of the eastern hemisphere has been either of the most casual nature or else as shadowy as the Atlantis itself, which is seriously referred to in this connection by otherwise sane writers, but which was obviously as pure an invention of Plato as the Utopia was of Sir Thomas More.

An essential condition of the Toltec theory is the assumed recent, or comparatively recent, date of all the Central-American monuments, and Charnay has certainly dispelled the extravagant ideas at one time prevalent regarding the hoary antiquity of some of these remains. He has shown in particular that no argument in favor of great age can be drawn from the size of the trees by which many of them are overgrown. By actual experiment he has proved that the concentric circles of these trees correspond, not to so many years, as had been supposed, but rather to so many months, if not even to shorter periods of growth. Thus collapse the extravagant estimates of 2000 years (Waldeck) or 1700 (Lorainzar) assigned to the buildings on this assumption. At the same time some of the cities were already forgotten ruins at the time of the conquest, and many of the structures date evidently back to a period prior to the Toltec migrations southwards. The bas-reliefs of Kabah also clearly show that these Toltecs, probably of Nahua stock and closely related to the Aztecs, already found the land occupied by a civilized people, able to record on stone monuments their triumphs over the northern invaders. Some of these monuments themselves equal, if not surpass, in artistic taste and workmanship anything the Toltec builders are known to have produced on the Anahuac plateau. They also present many distinctive features, especially in their design and decorative parts, while the inscriptions are altogether different from those of the Aztecs as seen in extant manuscripts. The conclusion seems inevitable that the Maya-Quiché culture was an independent growth, brought in later times under Nahua influences, the relations being perhaps somewhat analogous to those existing between the Græco-Bactrian and Indian or the Moorish and Spanish in the Old World.

[1] On one of the palaces "two salient cornices form a frame to immense friezes which in their details would compare favorably with our proudest monuments" (Charnay). On others are sculptured some remarkable bas-reliefs, which represent Maya warriors receiving the swords of kneeling Aztec captives, the nationalities of the figures being clearly identified by their respective costumes. The significance of records of this sort has either been altogether overlooked or else strangely misinterpreted by most writers on Central-American antiquities.

[2] In 1841 Stephens was assured by the cura of Santa Cruz del Quiché that the palaces of that place, then in a dilapidated state, were quite perfect thirty years before, and that the now deserted city of Utatlan in the province of Vera Paz was then almost as perfect as when its inhabitants had abandoned it. He had himself walked in its silent streets amid its colossal buildings, which were as entire as those of Santa Cruz.

[3] In a paper read before the American Antiquarian Society, 28th April, 1880.

Classification of Maya-Quiché nations.

At the time of the conquest a great part of Central America was found to be occupied, as it still is, by peoples related, at least in speech, to the Maya inhabitants of Yucatan. The numerous branches of this widespread family ranged from Tamaulipas (about the Tropic of Cancer) southwards to north Honduras and San Salvador (14° N. lat.). But the chief divisions were the Mayas of Yucatan and the Quichés of Guatemala, whence the compound term Maya-Quiché collectively applied to the whole race. Owing partly to the uncertainty of their mutual affinities, but mainly to the confusing and inconsistent nomenclature of the early Spanish and later writers, the classification of the various Maya-Quiché nations presents serious difficulties, some of which have not yet been overcome. In the subjoined scheme are embodied the results of the researches of De Bourbourg, Berendt, Stoll, and others in this intricate branch of ethnology:

Maya Group.—*Huasteca*, Vera Cruz and Tamaulipas; *Totonac*(?),[1] north part of Vera Cruz; *Maya proper*, throughout Yucatan; *Chol* (Cholti, Colchi), between the Salinas and Mondagnas rivers, Guatemala; *Mopan*, north of the Chols; *Chontal*, Tabasco, distinct from the Nicaraguan Chontales; *Tzental* (Cendal), Ocosingo district, Chiapas; *Tzotzil* (Zotzil, Zotzlem), San Cristobal, Chiapas; *Chañabal*, Comitan district, Chiapas.

Quiché Group.—*Cakchiquel* (Kacchikil), Tecpan to Sta. Lucia and the Pacific; *Tzutujil* (Sotojil, Zutuhil), Aitlan district, Guatemala; *Quiché proper* (Kiché, Utatlica), Cunen and Rabinal districts, and thence southwest to the Pacific, Guatemala; *Uspanteca*, San Miguel Uspantan, Guatemala.

Poconchi Group.—*Poconchi proper* (Pokomchi, Pacomchi), Tactic district, Guatemala; *Quekchi* (Cacchi, Aquacateca), Coban district, Guatemala; *Chorti* (Lenguaupay), Zacapa and Chichimula, and thence eastwards to Honduras; *Pokomam*, Jalapa, and thence to San Salvador.

Mame Group.—*Mame proper* (Mem, Zakloh-pakap), throughout southwestern Guatemala; *Ixil*, Cotzal district, Guatemala; *Aguacatecas* (Sinca, Xinca), throughout southeastern Guatemala; *Alagiulac* (?), San Cristobal, Chiapas.

Modern inhabitants.

Yucatan is still almost entirely inhabited by the same Maya race that was found in possession of the land at the time of the discovery. About five-sixths of the population are of nearly pure Maya stock and speech, the Spanish and mestizo elements being mostly confined to the large towns. The mestizos are said to be the handsomest on the continent, while the full-blood natives are perhaps the least characteristic of all the aboriginal populations. They have the coarse black and straight hair, the arched nose, and the reddish-brown complexion common to most of the primitive inhabitants of America. But they can be readily distinguished from all of them by their regular features, low cheek-bones, small mouth and ears, straight jaws, frank expression, and a certain air of refinement betraying descent from a highly cultured people. "It would be difficult," says Charnay, "to find among the rural classes of Europe men of a better build, or with more intelligent and open countenances." Although generally peaceful, patient under oppression, and even somewhat indolent, their history since the conquest (1547) has not been wholly uneventful. After more than two centuries of passive resistance, there was a general revolt in 1761, brought about by the intolerable misrule of the Spanish administration. The declaration of independence (1821) was followed in 1824 by the union with the Mexican confederacy, which continued without interruption till 1840. In that year an independent republic was set up in Yucatan, which, however, was suppressed in 1843. Then came the general uprising of the natives in 1846 when Mexico was engaged in a disastrous war with the United States. To quell the revolt, the ruling classes were obliged to call in the aid of the Mexicans (1847–53), whereby the peninsula again lost its autonomy, and was divided (1861) into the two federal states of Yucatan and Campeche. But the rebellion was not entirely suppressed, and many of the natives, withdrawing eastwards to the coast-lands beyond the Sierra Alta, have hitherto defied all the efforts of the authorities to reduce them.

Holden, "Studies in Central-American Picture-writing," in *Annual Report* of Bureau of Ethnology, Washington, 1879–80. (A. H. K.)

YUCCA,[2] a genus of the order *Liliaceæ*, the species of which are remarkable for their stately appearance and generally magnificent inflorescence. They occur in greatest frequency in Mexico and the southwestern States of the American Union, extending also into Central America, and occurring in such numbers in some places as to form "straggling forests." They have a woody or fibrous stem, sometimes short, and in other cases, even in the same species, attaining a height of 15 to 20 feet, and branching at the top into a series of forks. The leaves are crowded in tufts at the ends of the stem or branches and are generally stiff and sword-shaped, with a sharp point, sometimes flaccid and in other cases fibrous at the edges. The numerous flowers are usually white, bell-shaped, and pendulous, and are borne in much-branched terminal panicles. Each flower consists of a perianth of six regular pieces, as many hypogynous stamens, with dilated filaments, bearing relatively small anthers. The three-celled ovary is surmounted by a short thick style, dividing above into three stigmas, and ripens into a succulent berry in some of the species, and into a dry three-valved capsule in others. The flowers are fertilized by the agency of moths.

A coarse fibre is obtained by the Mexicans from the stem and foliage, which they utilize for cordage. The succulent fruits, which resemble small bananas, are cooked as an article of diet; and the roots contain a saponaceous matter used in place of soap.

Most of the species are hardy in Great Britain, and their striking appearance renders them attractive in gardens even when not in flower. Their rigid foliage, invested by thick epidermis, also enables them to resist the noxious air of towns better than most plants. A popular name for the plant is "Adam's needle." The species which split up at the margins of their leaves into filaments are called "Eve's thread."

YUN-NAN. See China, vol. v. pp. 556–7.

YUN-NAN FU, the capital of the Chinese province of Yun-nan, is situated in 25° 6′ N. lat. and 102° 52′ E. long. Originally the district surrounding Yun-nan Fu was known as the "land of the southern barbarians." The city, which under different dynasties has borne different names, is situated on a plain, and is surrounded by well-fortified walls, 6½ miles in circuit. Marco Polo describes it, under the name of Yachi, as "a very great and noble city, in which are numerous merchants and craftsmen. The people are of sundry kinds, for there are not only Saracens and idolaters but also a few Nestorian Christians. They have wheat and rice in plenty. . . . Their money is . . . certain white porcelain shells that are found in the sea." For many years Mohammedans have been very numerous in the city and neighborhood; and in 1855 a Mohammedan rising took place within the city. Yun-nan Fu has a prosperous and busy aspect: the shops are large and well supplied with native silken goods, saddlery, etc., while English cotton, Russian cloths, and raw cotton from Burmah constitute the main foreign merchandise. Employment for large numbers of workpeople is found in the copper factories. A local mint at Yun-nan Fu issued annually 101,000,000 cash [$92,920] before the outbreak of the rebellion in 1855. The population of the city is estimated at about 200,000.

YVETOT, a town of France, chef-lieu of an arrondissement in the department of Seine-Inférieure, stands on the plateau of Caux, 24 miles northwest of Rouen on the railway to Havre, and is chiefly

[1] Although Totonac is grouped by Brinton and others in this family, Gatschet is inclined to regard it as an independent stock language (*Réplique à Mr. D. G. Brinton*, Paris, 1888, p. 8).

[2] A Spanish word meaning "bayonet."

known from Béranger's famous song. Calicoes, tickings, Siamese, *rouennerie* cotton, reps, and handkerchiefs are made here, as in most places in the department, and a trade is carried on in wool. The church is ugly, but contains a marble altar from the Carthusian monastery at Rouen, some fine woodwork from the abbey of St. Wandrille, and an elegant pulpit. The remains of a Bernardine monastery are occupied in part by the court and jail. The hospital and seminary are both modern. The population was 7625 (commune 8397) in 1881 and 7333 (commune 7972) in 1886.

From the 15th till the middle of the 16th century the lords of Yvetot bore the title of king, and their lands were exempt from all service to the French crown. The town was occupied during the Hundred Years' War by Henry V. of England, and afterwards retaken by Charles VII. of France. On 8th May, 1592, Henry IV. defeated here the troops of the League under the duke of Parma. A Bernardine monastery was founded at Yvetot in 1650, and suppressed in 1781. In 1658 part of the town was destroyed by fire.

Z.

Z, the last letter of our alphabet, has fallen away from its old place in the Phœnician and Greek alphabets. In these it stood seventh, probably with the value of *dz* or *zd*. In shape it was Ⅱ in all the older writings both of the Ionian and the Eubœan type. Later it became Ζ, as we have it, by a natural and convenient change. But Ⅱ is the older Italian as well as the Greek form; it remained so in Oscan; in Etruscan and Umbrian the cross strokes were brought near together, but the upright line remained. The Latin alphabet, however, dropped the symbol, having apparently no need of it; it appears on an old coin of Cosa (*Corpus*, i. 14), unless the letter there be only a modified *s*. Later, in the 1st century B.C., the letter in the form Ζ was re-introduced, where we have it, to represent more accurately the sound of *z* in words borrowed from the Greek, in which alone it appears; *ss* (or initial *s*) had previously been employed for this purpose. The original place of the letter had been occupied in the meantime by G, the Latin modified form of C (see under G), so Ζ had to take the lowest place together with Y, which had been also borrowed from Greece for a similar purpose.

The exact value of zeta in Greek has been much discussed (see Blass, *Aussprache des Griechischen*, p. 95). That it was a double sound—not French *z* (the voiced sibilant corresponding to the voiceless *s*)—seems clear from Aristotle's statement that ξ, ψ, and ζ were all συμφώνιαι, and from its power of lengthening a previous short vowel in scanning. The arguments, however, for the *dz* or the *zd* value are about evenly balanced, and it is not improbable that it may have had both. In Latin the value was doubtless that of the Greek *z*.

In old English *z* hardly occurs; when it does it is in borrowed names with the value of *ts*, as in Betzaida, Zabulon. It was introduced in order to represent French *z* in words borrowed from France, as *zeal*, *zone* (see article S). But it is used in only a very small number of the words where the sound occurs: we still adhere to the usage of our forefathers and employ *s* for the *s*-sound and the *z*-sound alike, indeed rather inclining to use *s* for *z*, and to differentiate *s* by doubling the symbol: compare *his* (*i.e.*, hiz) and *hiss* (*i.e.*, his). In German *z* represents *ts*, the sound into which Teutonic *t* passed in High German—*e.g.*, in *herz*, our "heart." It was also used formerly, either alone or in combination with *s*, to denote the voiceless sibilant when final: thus the conjunction *dass*, which is nothing but the neuter pronoun *das*, was formerly written *daz*, and is sometimes even now written *dasz*. In French the Latin *z* became the voiced sibilant; and a similar process has taken place in modern Greek. In French, however, the final sound must once have been stronger—*e.g.*, in *fils* (filius), later *fiz*, and still later *fis* (as it is still pronounced), which passed into England in the form *Fitz* in proper names. Still plainer is the evidence of verbal forms like *avez* = avets = habetis.

For the history of the English variant ȝ for *z*, see article Y. (J. P.)

ZAANDAM, Zaanredam, or Saardam, a village of Holland, in the province of North Holland, 5 miles by rail to the northwest of Amsterdam, at the confluence of the Zaan with the Y. The houses are mostly of wood, painted white or green, and the place shares with the other villages of North Holland a high reputation for neatness and cleanliness. In the immediate neighborhood are a very large number of windmills, including corn, paper, saw, coffee, snuff, and other mills. Peter the Great of Russia wrought at Zaandam as a ship-carpenter for a short time in 1697, and the hut in which he is said to have lived is still shown and much visited. Some shipbuilding is still carried on. The population in 1887 was 14,351.

ZACATECAS, a city of Mexico, capital of the state of the same name, lies 340 miles by rail northwest of Mexico, in 22° 46′ N. lat. and 102° W. long. Zacatecas, which had a population of 46,000 in 1886, is the centre of one of the oldest and most productive silver-mining districts in the republic, and the town itself stands on the rich vein discovered here by Juan de Tolosa in 1546. It lies on the great Mexican tableland, 7976 feet above the sea, in a narrow ravine surrounded by rolling hills, all containing almost inexhaustible deposits of the precious metal. Within half an hour's walk of the centre of the town are situated twelve mines, some of which have been worked with little interruption for over three hundred years. Owing to the irregular nature of the ground and the great value of the land, the city is laid out in narrow tortuous streets, which, unlike most other Mexican towns, are lined by high houses of three and four stories. Noteworthy amongst the public buildings are the cathedral, with a finely sculptured façade, the Government palace, the city hall, the theatre, and the mint; this last, during the period from 1772 to 1865, issued silver money to the value of £41,000,000 [$199,260,000], besides £110,000 [$534,600] in gold. The streets, although narrow, are well paved and partly lit by electricity. Since the completion of the Central Mexican Railway to this place in 1884 it has increased in population and prosperity. From the Bufa Hill, 500 feet high, lying to the north of the city, an extensive view is commanded of the surrounding district, which is of an extremely rugged character and almost destitute of vegetation. In the neighborhood are nine small lakes, yielding an abundance of salt and carbonate of soda. Zacatecas, which received the title of city from Philip II. in 1585, is supplied with water by a large, well-constructed aqueduct.

The state of Zacatecas lies between Coahuila and Jalisco north and south respectively, and is elsewhere conterminous with Guanajuato, Durango, and San Luis Potosi. It has an area of 25,227 square miles and a population (1882) of 422,506, of whom a preponderating proportion are Indians or mestizos. It stands at a mean altitude of over 7000 feet above sea-level, and is traversed by the Mazapil, Norillos, Guadaloupe, and other metalliferous ranges, this state ranking among the first in the republic for mineral wealth. Next to the Veta Madre of Guanajuato and the famous Comstock lode, Nevada, the Veta Grande of Zacatecas is held to be the most remarkable silver vein in North America. The chief mining districts are Zacatecas, Espiritu Santo, Chapala, Los Arcos, Norias, Ipala, Santa Lucia, Naranjal, and Santo Martino; and in 1886 about 324 mines were open (21 gold, 67 gold and silver, 167 silver alone, 15 copper, 37 lead, and 16 quicksilver). Besides its minerals

the state possesses considerable agricultural resources, the southeastern parts especially being very fertile and well watered by the rivers Tlaltenango and Juchipila. Maize, wheat, fruits—such as peaches, apricots, grapes,—and all kinds of vegetables are extensively cultivated, the annual maize crop being valued at over £1,000,000 [$4,860,000], wheat at about £250,000 [$1,215,000], and the remaining crops at about £600,000 [$2,916,000]. Even in the bleak and arid northern districts there are some extensive grazing-grounds, where cattle, horses, mules, sheep, and goats thrive well. Some of the slopes are well timbered, the chief species being the mountain cedar, oak, elm, ash, and cotton-wood. Besides the capital, the chief mining towns are Fresnillo (pop. 15,000), Garcia (8000), Villanueva (7000), Linos (7000), Sombrerete (6000), and Nieves (3000).

ZACH, Franz Xaver, Baron von (1754–1832), astronomer, was born at Pesth[1] in June, 1754. He served for some time in the Austrian army, and afterwards lived in London from 1783 to 1786 as tutor in the house of the Saxon minister, Count Brühl. In 1786 he was appointed by Ernest II. of Saxe-Coburg-Gotha director of the new observatory on the Seeburg at Gotha, which was finished in 1791. From 1806 Zach accompanied the duke's widow on her travels in the south of Europe. He died in Paris on 2d September, 1832.

Zach published *Tables of the Sun* (Gotha, 1792; new and improved edition, *ibid.*, 1804), and numerous papers on geographical subjects, particularly on the geographical positions of many towns and places, which he determined on his travels with a sextant. His principal importance is, however, as editor of three scientific journals of great value,—*Allgemeine Geographische Ephemeriden* (4 vols., Gotha, 1798–99), *Monatliche Correspondenz zur Beförderung der Erd- und Himmels Kunde* (28 vols., Gotha, 1800–13, from 1807 edited by Lindenau), and *Correspondance Astronomique, Géographique, Hydrographique, et Statistique* (Genoa, 1818–26, 14 vols., and one number of the 15th suppressed at the instigation of the Jesuits).

ZACHARIAE VON LINGENTHAL, Karl Salomo (1769–1843), German jurist, was born on 14th September, 1769, at Meissen, in Saxony. His family came from Austria. His father was a lawyer; his mother, a Hessian, was the daughter of a pastor. Of feeble health and long the only child of his parents, Karl did not go to school until the age of fifteen. He afterwards studied philosophy, history, mathematics, and philology at the university of Leipsic. In 1792, he went to Wittenberg as tutor to Count zur Lippe, and whilst there he began to study law. There he came greatly under the influence of Kant, traces of whose teaching remain even in his latest writings. In 1794, Zachariae became a privat-docent, lecturing on canon law, in 1798, extraordinary professor, and in 1802, ordinary professor of feudal law. From that time to his death in 1843, with the exception of a short period in which public affairs occupied him, he poured out a succession of works covering the whole field of jurisprudence and extending into other adjoining regions. He was also indefatigable in the labor of his chair, and he was the editor of, or a copious contributor to, more than one periodical. In 1807, he went to Heidelberg, then beginning its period of splendor as a school of law. There, resisting many calls to Göttingen, Berlin, and other universities, he remained until his death. In 1811, he married under romantic circumstances. His wife died in four years.

In 1820, he was elected representative of the university in the first Baden chamber, and four years later was made a member of the second. From 1825 to 1829, he devoted much time to political affairs and to the preparation of a code. He was a constitutional reformer, averse to great or violent changes. He loved to cite the saying of the Roman emperor to his adopted son,—"Imperaturus es hominibus qui nec totam servitutem pati possent nec totam libertatem,"—"a truth," he observes in one of his many brochures (*Die Souverainetätsrechte der Krone Würtemberg*, etc.), "which no Government and no people should ever forget." In 1842, he was ennobled with the title of Von Lingenthal. To the last days of his life he toiled with the ardor of a young student. His fame extended beyond Germany. The German universities then enjoyed by tacit consent a jurisdiction in regard to legal questions of international importance which had come down from the Middle Ages; and Zachariae was often consulted as to questions arising in Germany, France, and England. Elaborate "opinions," some of them forming veritable treatises,—*e.g.*, on Sir Augustus d'Este's claim to the dukedom of Sussex, Baron de Bode's claim as an English subject to a share in the French indemnity, the famous dispute as to the debts due to the elector of Hesse-Cassel, confiscated by Napoleon, and the constitutional position of the Mecklenburg landowners,—were composed by Zachariae. He died on 27th March, 1843, leaving a son who has worthily continued his father's labors in jurisprudence.

Zachariae's true history is in his writings, which are extremely numerous and multifarious. They deal with almost every branch of jurisprudence; they are philosophical, historical, and practical; they relate to Roman, canon, German, and French law; and his curiosity extended to the writings of his contemporaries, Bentham and Austin. A work on Sulla, in whom he sees another Napoleon, and an unpublished translation of his favorite Tacitus were some of the fruits of his restless activity. The first book of much consequence which he published was *Die Einheit des Staats und der Kirche mit Rücksicht auf die Deutsche Reichsverfassung* (1797), one of the most original of his works, displaying the writer's power of analysis, his skill in making a complicated set of facts appear to be deductions from a few principles,—a study even now well worth reading. His theme is the relation of religion to the state. Zachariae undertakes to show that with Christianity three systems only are possible,—(1) what he calls the system of hierarchy, according to which the state is under the power of the church, the object of the former being subordinated to that of the latter; (2) the territorial system, according to which the church is subject to the power of the state; and (3) what he terms the collegiate system, according to which neither of the two societies is subject to the other, and both have different objects in view. The consequence of the adoption of these various systems—the principles of law which must be accepted according as one or the other of them is supreme—he deduces with much acumen. While much of his work has lost its interest, it remains a luminous example of the application of the deductive process to historical investigation, a proof that legal conceptions may often serve to give unity to the complex facts of history. In 1805, appeared *Versuch einer allgemeinen Hermeneutik des Rechts*. Neither in English nor in Scotch legal literature is there any book, so far as known to the present writer, covering the field to which it relates. It is an attempt to found on the rules of grammar and logic a system of interpretation applicable to all systems of law. The weak part of the book is that, like so many of Zachariae's works, it stops short at the point where the inquiry would be most fruitful. Illustrations are taken from Roman law; we miss any adequate treatment of the problems which the forms of modern legislation raise. In 1806, appeared *Die Wissenschaft der Gesetzgebung*, a fragment, which is a curious outcome of the French Revolution. Impressed by the overthrow or decay of the forces which had hitherto held society together, he looked about for a better substitute for them than *politique de circonstance* offered. Many of Zachariae's maxims seem fanciful; there are divisions which do not elucidate, and distinctions made apparently for their own sake. But the work is interesting; it shows that the author was groping after the principle of utility as the guide of the legislator; the study of very different facts had brought him independently to much the same conclusion as Bentham had reached. Zachariae's last work of importance was *Vierzig Bücher vom Staate*, published in 1839–42, with the motto *non omnis moriar*. This was his favorite work, and is the one to which his admirers point as his enduring monument. Undoubtedly it contains much erudition and, what is rarer, many original ideas as to the future of the state and of law. It has been compared to *L'Esprit des Lois*, and Zachariae, in spite of his pedantry, has some tincture of the discursive brilliancy of Montesquieu. It covers no small part of the field of Buckle's first volume of the *History of Civilisation*. The reader will, however, seek in vain for any order or system in some of the chapters of

[1] [The astronomer was born in Pressburg. His elder brother Anton (1747–1826), known also as baron, was born at Pesth and became an Austrian field-marshal.—Am. Ed.]

Vierzig Bücher vom Staate. He was recasting many of his ideas as he wrote, and the book ends before the process is completed. Among the most esteemed of the works of Zachariae is that on *Staatsrecht*, of the originality of which he was proud, and his treatise on the *Code Napoléon*, a marvellous work, considering it was composed by a German professor who did not much concern himself with this subject till somewhat late in life. There are no fewer than three French editions of his book, and it has been translated into Italian. Zachariae edited with Mittermaier the *Kritische Zeitschrift für Rechtswissenschaft und Gesetzgebung des Auslandes*, and the introduction which he wrote illustrates his wide reading and his constant desire for new light upon old problems.

Zachariae exhibits the best and the worst sides of German jurisprudence: there is the desire not to base generalizations or conclusions on the peculiarities of any one system, but to master the whole facts. He does not assume a distinction or classification of Roman law to be necessarily scientific. He seeks real reasons; he avoids the English lawyer's favorite fallacy of proving *idem per idem*, of seeking to show the reasonableness of anything by saying the same thing again in different language. Though a scholar, Zachariae has not the weakness of exaggerating the importance of whatever is rare or unpublished, and he has no delight in barren eruditiou. Himself a learned pandectist, he had cast aside his countrymen's proneness to find all things in the *Corpus Juris*. His books, however, have the failings of so many German works on law. They want actuality; they have little relation to the facts of life. They are leavened by metaphysics—often very bad metaphysics, and not always by the same system. Nor is he a clear thinker. We are never sure what is his notion of the province of jurisprudence; his favorite idea appears to be that law creates among men an order similar to that which exists in the physical world, and that it is a security for the freedom of man's will. The influence of Kant is observable in all his works. In his later that of Hegel also appears; and his mental changes do not end there. He does not indeed say, "Back to Montesquieu; study facts, the simplest and primitive facts above all; adopt his method, and improve upon it;" but that is the wise spirit of some of his later works. Unfortunately, he did not fulfil the promise which they contain. He had not learned to distinguish sharply between the science and the practical art of jurisprudence, and we are never certain in what capacity he speaks. He had not conceived clearly the truth that society forms one whole, that the phenomena of law at any given time or place are not accidents but the outcome of a long train of events, that, so regarded, they are as much susceptible of scientific treatment as the facts of language, and that a treatise on botany or, still more, one on comparative philology is a better guide to what jurisprudence may yet be than a volume of Hugo or even Austin. It was made a reproach to Zachariae that he changed his opinions. He did so; it was a sign of his single-mindedness and restless curiosity. It is also one of the reasons why his works are now little read. They opened paths, and they were superseded by others which could not have existed without them.

There is no adequate account of Zachariæ and his works; the best are Robert von Mohl's *Geschichte u. Literatur der Staatswissenschaften* (1855–58) and Charles Brocher's *K. S. Zachariæ, sa Vie et ses Œuvres* (1870). (J. M†.)

ZACHARIAS, St., pope from 741 to 752, was a Greek by birth, and appears to have been on intimate terms with Gregory III., whom he succeeded (November, 741). Contemporary history dwells chiefly on his great personal influence with the Lombard king Luitprand, and with his successor Rachis; it was largely through his tact in dealing with these princes in a variety of emergencies that the exarchate of Ravenna was rescued from becoming part of the Lombard kingdom. A correspondence, of considerable extent and of great interest, between Zacharias and St. Boniface, the apostle of Germany, is still extant, and shows how great was the influence of this pope on events then passing in France and Germany: he encouraged the deposition of Childeric, and it was with his sanction that Boniface crowned Pippin as king of the Franks at Soissons in 752. Zacharias is stated to have remonstrated with the emperor Constantine Copronymus on the part he had taken in the iconoclastic controversy. He died 14th March, 752, and was succeeded by Stephen II.

ZAIRE,[1] or CONGO, designations of the river now generally known under the latter name (see vol. i. pl. II.). This river system occupies a large part of equatorial Africa,—1,540,000 square miles according to a probable estimate; and in the length of its course (some 2900 miles) and the volume of its discharge (1,500,000 or at least 1,200,000 cubic feet per second) the river ranks among the most important in the world.[2] The history of the exploration of the Congo basin is a matter of yesterday and to-day; and in several directions the exact limits, with the relations of the affluents to the system, have still to be determined. The mouth of the river lies on the west coast of the continent in 6° S. lat. and 12° 25′ E. long. The headwaters of its most eastern stream (Malagarazi) rise only 370 miles from the Indian Ocean. The course of the main river describes a vast bow, the central portion of which lies as far north as 2° N. lat.

To the north of the Lokinga or Mushinga Mountains, a range, reaching about 6000 feet in altitude, which sends its southward drainage to the Zambesi, lies Bangweolo (Bemba, Shuia, or Chama) Lake, at a height of 3700 feet above the sea according to Livingstone, or 4300 according to Giraud. It has a very irregular outline. Nowhere more than 18 or 20 feet deep, it is nevertheless fed by several large rivers, of which the Chambesi or Chasi ranks first. Livingstone, who discovered the Chambesi in 1867 in 10° 34′ S. lat., describes it as "flooded with clear water, not more than 40 yards wide, showing abundant animal life in its waters and on its banks." Its head-streams drain the country between the south end of Lake Tanganyika and the north end of Lake Nyassa.

From the southwest extremity of Lake Bangweolo issues the Luapula, which is generally regarded as the main head-stream of the Congo. It is about 20 feet deep and 200 yards wide. Our knowledge of its course is still imperfect, though from Giraud (1883) and Capello and Ivens (1884–85) we learn that it is interrupted by dangerous rapids (at Mambirima, etc.); and there is no doubt that it is gradually deflected northwards and is the main affluent of Lake Moero. This extensive basin is quite different from Lake Bangweolo: its southern end is situated in a low marshy plain and the difference between high and low water level is as much as the whole depth of Bangweolo. From north to south the total length is upwards of 90 miles, though during the rainy season vast additional tracts to the south are under water. Several considerable affluents fall into the lake from the east. The river has not been followed between Lake Moero and Lake Lanji; but near the latter it is known to receive the Kamirondo from the left and the Lukugu from the right.

The basin of the Tanganyika is a "vast chasm enclosed within mountain ranges or cliffs, often rising steeply from the shore and terminating in elevated plateaus," with depths of 300 or 350 fathoms. The total length is 380 miles; and, while the northern end narrows to about 10 miles, the width towards the centre is from 30 to 50 miles. The islands are few and unimportant, and except at the great peninsula of Ubwari on the west coast, near the northern end of the lake, the shore line is remarkably regular. The water is perfectly fresh. Of the various settlements on Tanganyika the most important is Ujiji (4° 54′ S. lat. on the east coast), which formerly gave its name to the lake. "It is the terminus," in the words of Captain Hore, "of what for many years was the only safe and well-known route from the East Coast of Africa to the lake, and an important station upon a line of traffic, geographically suited and by common consent adopted as convenient, right across the continent." Another point of interest is Karema (in 6° 50′ S. lat., on

[1] Zaire is a Portuguese corruption of a native word. It is doubtful whether Congo was first the name of the kingdom or of the river; according to Janko (*Petermann's Mitteilungen*, 1888), the work probably means originally a "spear." Stanley called the river the Livingstone; but this designation has not become popular.

[2] Dr. Murray of the "Challenger" Expedition estimates the mean annual discharge of the Congo at 419.291 cubic miles, making it in this respect only second to the Amazons (*Scot. Geog. Mag.*, 1887). The annual rainfall of the basin he puts at 1213.344 cubic miles.

the eastern shore), originally a station of the African International Association. A lighthouse has also been erected on Kavala Island.

The connection of Tanganyika with the system of the Congo is one of the most curious points in Central African hydrography. When Livingstone and Stanley were at Ujiji in 1871 the level of the lake was low. Between that date and 1874 it appears to have risen greatly, as Commander Cameron found that the Lukuga (mouth in 5° 35′ S. lat.) was acting as an overflow pipe. In 1876 Stanley obtained further proof of the increase of the lake: three palm-trees which had stood in the market place of Ujiji in 1871 were then 100 feet in the lake, and the sand beach over which he had walked with Livingstone was over 200. But his careful examination of the Lukuga outlet showed (curiously enough) that there was no distinct outflow from the lake, though he thought it pretty certain that the Lukuga had at one time been an effluent and that it was about to resume its old function. In March, 1879, Captain Hore placed a gauge on the shore at Ujiji. By the 27th of May he found the waters had fallen 2 feet, and in August, 1880, they reached a point 10 feet 4½ inches below the original mark. They were still subsiding in 1886.

The Lukuga outlet seems to be a comparatively modern formation. The portion towards Tanganyika appears to have been originally a stream flowing into the lake, all its affluents still having a lakeward direction, while the section towards the Congo was a minor tributary of that river. At what period and by what circumstances the affluent was turned into an emissary it is hard to determine. Stanley proposed the bold theory that Tanganyika at one time consisted of two divisions, one at a higher level than the other, and that the sudden destruction of the barrier caused the lower lake to rise with such violence as to force a passage up the Lukuga and across the ridges to the Congo. Captain Storms suggests instead that Lake Hikwa or Rikwa (discovered by Joseph Thomson in 1880), which lies 50 miles to the east of Tanganyika, was more probably the source of the inundation. A visit to the plain of Katawi convinced him that this must at one time have formed part of Lake Hikwa, then about three times its present size. About 12 leagues N.N.E. of Karema he says there is a gap in the chain which separates the basin of the smaller from that of the larger lake. Not improbably, however, no such cataclysm as that proposed by Stanley or Storms is really necessary to account for the Lukuga phenomenon. The very fact that, in the short space of time during which the Tanganyika has been observed by Europeans, its level has undergone such considerable alteration seems to suggest that a series of unusually rainy seasons may have been the source of all the inundation that was requisite.[1]

Below Lake Lanji there is another portion of the stream still unexplored; but from the junction of the Luama, a river 400 yards wide at its mouth (about 5° S. lat.), the whole course of the Congo down to the Atlantic (1800 miles) is known. At Nyangwe the channel is about a mile wide, with (according to Stanley) a volume of 230,000 cubic feet per second. As it flows northward it receives the Elila, the Ulinde, the Lowa, and the Munduku Lilu, all of moderate importance. The first point of much interest is the series of cataracts known as the Stanley Falls, situated at the equator. The first cataract occurs just after the Congo has received the Black river and the Leopold river; about 6 miles farther down follow in somewhat rapid succession the second, third, fourth and fifth; and then the river is divided into two by the large inhabited island of Asama. The sixth cataract, caused by a broad dike of greenish shale, does not occur for upwards of 20 miles, and between the sixth and seventh there is a distance of 25 miles. At the last of these the Congo is about 1300 yards broad, of which width 40 yards is occupied by the right branch, 760 yards by the island of Wemya, and 500 yards by the main river. The fall is only about 10 feet; but the enormous mass of water, and the narrow limits to which it is suddenly contracted, make it much more imposing than many a far loftier cataract. After passing the falls the first great left-hand affluent is the Lubilash or Boloko, first ascended by Grenfell in 1884 to the neighborhood of 1° 30′. Next we come to an important right-hand affluent, the Aruwimi, Arawhimi, or Biyerre, which is now recognized as identical with the Nepoko, discovered by Junker in the south of the Monbuttu territory. About 24° 30′ E. lat. this stream, which discharges 158,850 cubic feet per second, is interrupted by the Yambuga Falls; but above the falls Stanley in 1887 found it navigable for his steel boat. Another right-hand affluent of similar rank is the Itimbiri or Loika, ascended in 1884 by Grenfell for 100 miles as far as the Lubi Falls. No other tributary of equal importance is known to exist till we come to the Lulongo, about 45 miles north of the equator, formed by the junction of the Lopuri and the Masinga, which drain the country to the south of the great bend of the river. The Lopuri is 500 yards wide at the confluence and has a depth of from 7 to 8 feet. The Lulongo is 500 yards wide at its mouth and higher up occupies a channel from one-half to three-quarters of a mile in width. According to Von François, it discharges 494,200 cubic feet per second. It was ascended in 1885 by Grenfell, who describes it as commercially the most important affluent of the Congo, on account of the value of its ivory and slave trade. Just to the north of the equator is the junction of the Juapa or Chuapa, which Grenfell has followed as far east as 23° E. long., a distance of 400 miles. This is Stanley's Black river. An unusual amount of geographical interest attaches to the next Congo tributary—the Ubangi or Mobangi: if the latest reports are to be trusted, it is the recipient of the waters of the Welle-Makua, the river discovered by Schweinfurth in 1870, which has ever since been one of the hydrographic problems of the time.[2] Grenfell ascended the Ubangi in 1885 for some distance above the rapids of Zongo, which are formed by the river striking athwart a line of hills running northwest and southeast, with peaks from 600 to 700 feet above the level of the stream. At this point the breadth is reduced to about 800 yards. In 1886 M. van Gèle failed in his attempt to surmount the Zongo rapids; but in 1888, according to the latest reports, he succeeded in advancing sufficiently far up the river (which turns eastward at the rapids) to prove its identity with the Welle-Makua. By this discovery the limits of the Congo basin are carried eastward as far as within 40 miles of the Nile at Wadelai—the Welle being mainly formed of the Kibali, a stream about 80 yards wide, whose head-waters rise in that neighborhood.[3] Quite a multitude of secondary streams join the upper course of the Ubangi, and it continues to receive accessories from the north and west till it merges in the longer river, into which it is calculated to pour about 529,500 cubic feet per second. Its last right-hand tributary probably drains the Tukki swamp in 13 E. long. The Nghiri Muinda or Loij, a comparatively small river draining the peninsula between the Ubangi and the Congo, joins the former about 30′ N. lat., with a current 100 yards wide and from 15 to 20 feet deep. It was ascended by the "Henry Reed" in 1886 as far as Mikutu (1° 20′ N. lat.), where the stream, still 9 feet deep, was found to be formed of a number of small channels issuing from a swampy forest. The Ibangi, a right-hand tributary of the Ubangi, was also navigated for 60 miles to a spot where the depth was still 10 feet; but the passage was obstructed by a barrier of tree trunks. The ascent of the Lobay, which is about 200 yards wide and 13 feet deep at its junction with the Ubangi in 3° 50′ N. lat., was interrupted at a distance of 40 miles by a three-foot fall.

A short distance below the confluence of the Ubangi and Congo there enters from the left the emissary of Mantumba Lake, a considerable basin discovered by Stanley in 1883 and since examined by W. H. Bentley in the missionary ship "Peace." When the Congo is in flood there is a back-flow into the lake, and, as the

[1] See *Bull. Soc. Roy. Belge de Géog.*, 1886. or *Scot. Geog. Mag.*, 1886.

[2] For the discussion of the Welle problem, see *Mouvement Géographique*, 1886, Janko's resumé of theories in *Scot. Geogr. Mag.*, 1888, and Wills's criticism of the same.

[3] See map illustrating the journeys of Dr. W. Junker, *Proc. Roy. Geogr. Soc.*, 1887.

whole country is very flat, it is quite possible that there is a connection both with the Uruki and Bussera, on the one hand, and with Lake Leopold II., on the other. This latter lake is much larger, and is certainly connected southward with the Lukinje or Lukatta, a tributary of the Kassai.

In its further course the Congo is joined by a number of moderate-sized streams from the west. Below Lukolela it spreads out into a kind of river lake 20 to 25 kil. (12½ to 15½ miles) wide, and along its left bank extends a swampy region, the chain of low wood-covered hills which has hitherto confined the valley retiring for a mile or two. In 3° 15′ S. lat. it receives its last great affluent—the Kassai or Kwa, which has recently been proved to be the most important of the southern or left-hand, as the Ubangi is the most important of the northern or right-hand, tributaries. The Kassai rises to the south of 12′ S. lat. and flows north through Muata Yamvo's kingdom. In its upper course it possibly receives an emissary from Lake Dilolo, which also sends a branch south to the Zambesi. As it advances northwards it is joined by a large number of streams, all generally flowing northward. The Kassai enters the Congo in 3° 10′ S. lat., with a depth of 25 to 80 feet and a breadth of 600 yards, at a height of 942 feet above the sea. The exploration of the system was carried out by Wissmann, Wolf, Von François, and Mueller in 1883–85. The Kassai itself has been ascended as far as the Wissmann Fall in 5° 40′ S. lat., and its course has been struck at Digundu in 10° S. lat. The Lulua, which joins it from the right, is known as high up as Kangombe Fall; it is there about 200 yards wide; but it does not become truly navigable till it is joined by the Luebo. The Sankuru, at one time supposed to flow directly into the Congo, enters the Kassai by two arms, 820 feet and 200 feet in breadth, in 4° 17′ S. lat. and 20° 15′ E. long., its bright yellow waters forming a strong contrast with the brown of the larger stream. The Kuango, a fine stream, with its headwaters in the same district as those of the Kassai, flows in a wonderfully straight course north to join that river in 17° 30′ E. long. It was ascended by Mechow in 1880 as far as the rocky ledge at Kikamshi or Kinganshi; and, though it is only 3 feet high, the same barrier prevented the ascent of Grenfell's steamer in 1887.

For 87 miles after receiving the Kassai or Kwa the Congo flows in a deep gorge, between banks sometimes 700 feet high. In 4° 5′ S. lat. it enters Stanley Pool, an island-studded lake 1147 feet above the sea, expanding southward of the main course of the river. Its rim is "formed by sierras of peaked and picturesque mountains, ranging on the southern side from 1000 feet to 3000 feet in height." The banks offer considerable variety in character. A striking object on the north bank is the Dover Cliffs, so named by Stanley from their white and glistening appearance, produced, however, not by chalk but by silver sand, the subsidence of which into the water renders approach to the bank sometimes dangerous. Towards the lower end of the lake the country on both sides becomes comparatively low and flat, and at places swampy. On the south side, however, stands the great red cliff of Kallina Point (about 50 feet high), so named after an Austrian lieutenant drowned there in 1882. Round the point rushes a strong current 7½ knots an hour, difficult to stem even for a steamer. On the river, as it leaves the Pool, are situated (south side) Leopoldville, founded by Stanley in 1881, and Brazzaville, a station established by the French explorer De Brazza. Below Stanley Pool the Congo begins to break through the coast ranges, and forms a long series of rapids and falls, often enclosed between rocky shores, and even cliffs. Among the more important falls are those named Mahmey, Zinga, Ntambo, Uataka, Itunzima, Isangila, Ngoma, and Yellala. At Yellala, just above Vivi, the river escapes into the lowlands and is navigable for the rest of its journey to the sea (113 miles). Below Boma (5° 48′ S. Lat.) it widens out and is interrupted by numerous islands; but it does not break up into several channels so as to form a delta, though there are various creeks that appear as if they might yet become deltaic outlets. Between Banana Point on the north and Shark Point on the south the mouth of the Congo has a width of 7 miles. At Banana Point (at which there is not a vestige of the plant whose name it bears) there is fair harborage for sea-going vessels. Shark Point is also known as Padron Point, from the remains of a stone pillar (*padrão*) erected by the Portuguese explorer Diogo Cão (visited by Burton, 1863; by Daunett, 1887).

The exploration of the Congo system has been accompanied and followed by one of the most remarkable political movements of modern times. On 15th September, 1876, the International African Association was constituted, under the presidency of Leopold II., king of the Belgians, for the purpose of devising the best means of opening up equatorial Africa to civilization. Later on (25th November, 1878) was founded under the same auspices a Comité d'Études du Haut Congo, which afterwards became known as the International Association of the Congo. It was as an agent of this association that Mr. Stanley undertook his epoch-making ascent of the river in 1879. In September the first permanent station of the association was founded at Vivi;[1] in December the second at Jangila; and in May, 1881, the third at Manyanga. The association was recognized as an independent territorial government by the United States in April, 1884, and by Germany in November of the same year. An international conference for the regulation of the relations of the new state and the various European Governments was held at Berlin under the presidency of Prince Bismarck (15th November, 1884–26th February, 1885). The permanent neutrality of the Congo State territory, freedom of commerce in the Congo basin, and the abolition of the slave trade were among the main points established by the plenipotentiaries. In the close of 1884 and the early part of 1885 the association was recognized by England (16th December, 1884), Italy, Austria-Hungary, the Netherlands, France, etc. In April, 1885, the Belgian chamber of representatives authorized King Leopold to become sovereign of the new state—the union between Belgium and the Congo to be purely personal. The total area of the Independent State of the Congo, as it is officially designated, is estimated at 807,125 square miles, and its population may be about 40,000,000. It has a very limited coast-line, being hemmed in by French territory on the north and by Portuguese territory on the south. The southern limit is a conventional line from Nokki (on the south bank of the river below Vivi) across the continent to Langi Lake; the northern limit follows the fourth parallel of N. lat. from 17° to 30° E. long. French territory occupies all the north bank of the river from Ngombi (15. E. long.) up to Lukolela. In 1888 the state maintained 146 white officials, and had a force of upwards of 1000 native soldiers (Zanzibaris, Haussas, and Bangalas). It has four steamers on the lower Congo and five on the upper. The value of the commerce is as yet only £560,000 [$2,721,600], the principal exports being india-rubber, ivory, coffee, palm nuts and oil, copal, and wax. As to the possibility of developing the country into a great consumer of European goods there has been much and bitter discussion; at the present stage it is admitted that it has no native product of value in sufficient quantity to pay for a large importation. The river, however, has recently been proved navigable for sea-going vessels as far as the capital, Boma, and no serious difficulties have been met by the engineers engaged in surveying a railway from the lower Congo up to Stanley Pool.

ZALEUCUS. See Locri.

ZAMBESI, the most important river on the East Coast of Africa (see vol. i. pl. II.), and the fourth largest on the continent, drains during its course of about 1200 miles an area of 600,000 square miles. Its head-streams, which have not yet been fully explored, are the Leeambye or Iambaji, rising in Cazembe's country; the Lungebungo, which descends from the

[1] See list of stations—some of which have been since abandoned—in *Scot. Geogr. Mag.*, 1885.

Mossamba Mountains; and the Leeba river, from the Marshy lake Dilolo (4740 feet), situated between 10° and 12° S. lat. and 22° and 23° E. long. These three rivers, reinforced by the Nhengo, unite to form the upper Zambesi (Leeambye), which flows at first southwards and slightly eastwards through the Barotse valley, then turns prominently to the east near its junction with the Chobe (Chuando or Linianti), and passes over the Victoria Falls. Thence, as the middle reach of the Zambesi, the river sweeps northeast towards Zumbo and the Kebrabassa rapids above Tete, and finally forms the lower Zambesi, which curves southwards until it reaches the Indian Ocean at 18° 50′ S. lat. Fed chiefly from the highland country which stretches from Lake Nyassa to inner Angola, its chief tributaries are the Loangwa and the Shiré, the last an important river draining out of Lake Nyassa, and which in the dry season contains probably as great a volume of water as the Zambesi, and is much more navigable. Except for an interruption of 70 miles at the Murchison cataracts, the Shiré is open throughout its entire length to the lake.

On the whole the Zambesi has a gentle current, and flows through a succession of wide fertile valleys and richly wooded plains; but, owing to the terrace-like structure of the continent, the course of the river is interrupted from point to point by cataracts and rapids. These form serious, and in some cases insurmountable, hindrances to navigation. Those on the lower Zambesi begin with its delta. The bar here was long held to be impassable, except to vessels of the shallowest draught; but the difficulty was exaggerated partly through ignorance and partly in the interests of the Portuguese settlement of Quilimane, which, before the merits of the Kongone entrance were understood, had been already established on the Qua-qua river, 60 miles to the north. The Zambesi is now known to have four mouths, the Milambe to the west, the Kongone, the Luabo, and the Timbwe. The best of these, the Kongone, has altered and the channel improved recently. There are at least 18 feet of water on the bar at high water neap tides, and steamers drawing 15 feet, and sailing vessels drawing 3 feet less, have no difficulty in entering. The deep water continues only a short distance; and, after Mazaro (60 miles) is reached, where the river has already dwindled to the breadth of a mile, the channel is precariously open in the dry season as far as Senna (120 miles from the mouth) for vessels drawing 4½ feet. Up to this point navigation could only be successfully and continuously carried on by vessels of much lighter draught—stern-wheelers for preference with a draught of little more than 18 inches. About 90 miles from Senna the river enters the Lupata gorge, the impetuous current contracting between walls to a width of scarcely 200 yards. Passing Tete (240 miles from the mouth with a smooth course), the channel becomes dangerous at Kebrabassa, 90 miles farther on. From the Kebrabassa rapids upwards, and past the Victoria Falls, there are occasional stretches of navigable water extending for considerable distances, while the upper Zambesi with its confluents and their tributaries forms a really fine and extensive waterway. Like the Nile, the Zambesi is visited by annual inundations, during which the whole country is flooded and many of the minor falls and rapids are then obliterated.

The chief physical feature of the Zambesi is the Mosi-oa-tunya ("smoke sounds there") or Victoria Falls, admitted to be one of the noblest waterfalls in the world. The cataract is bounded on three sides by ridges 300 or 400 feet high, and these, along with the many islands dotted over the stream, are covered with sylvan vegetation. The falls, according to Livingstone, are caused by a stupendous crack or rent, with sharp and almost unbroken edges, stretching right across the river in the hard black basalt which here forms the bed. The cleft is 360 feet in sheer depth and close upon a mile in length. Into this chasm, of more than twice the depth of Niagara, the river rolls with a deafening roar, sending up vast columns of spray, which are visible for a distance of 20 miles. Unlike Niagara, the Mosi-oa-tunya does not terminate in an open gorge, the river immediately below the fall being blocked at 80 yards distance by the opposing side of the (supposed) cleft running parallel to the precipice which forms the waterfall. The only outlet is a narrow channel cut in this barrier at a point 1170 yards from the western end of the chasm and some 600 from its eastern, and through this the Zambesi, now only 20 or 30 yards wide, pours for 120 yards before emerging into the enormous zig-zag trough which conducts the river past the basalt plateau.

The region drained by the Zambesi may be represented as a vast broken-edged plateau 3000 or 4000 feet high, composed in the remote interior of metamorphic beds and fringed with the igneous rocks of the Victoria Falls. At Shupanga, on the lower Zambesi, thin strata of gray and yellow sandstones, with an occasional band of limestone, crop out on the bed of the river in the dry season, and these persist beyond Tete, where they are associated with extensive seams of coal. Gold is also known to occur in several places.

The higher regions of the Zambesi have only been visited by one or two explorers; and the lower, though nominally in possession of the Portuguese since the beginning of the 16th century, are also comparatively little known. The Barotse valley or valley of the upper Zambesi is a vast pastoral plain, 3300 feet above sea-level, about 189 miles in length and 30 to 35 broad. Though inundated in the rainy season, it is covered with villages and supports countless herds of cattle. The Luinas who inhabit it are clothed with skins, work neatly in ivory, and live upon milk, maize, and sweet potatoes. In the neighborhood of the falls the tsetse fly abounds, so that the Batoka people who live there, and who are the only arboriculturists in the country, live upon the products of their gardens. Zumbo, on the north bank, and Chicova, opposite on the southern side (500 miles above the delta), were the farthest inland of the Portuguese East African settlements, and are well placed for commerce with the natives. Founded by Pereira, a native of Goa, these settlements were ultimately allowed to go to ruins; but Zumbo has been recently re-occupied. The once celebrated gold mines of Parda Pemba are in the vicinity. The only other Portuguese settlements on the Zambesi are Tete and Senna. Tete, formerly a large and important place, now nearly in ruins, still possesses a fort and several good tiled stone and mud houses. Thither Portuguese goods, chiefly wines and provisions, are carried by means of canoes. The exports, which include ivory, gold dust, wheat, and groundnuts, are limited owing to the difficulty of transport; but this difficulty is not insurmountable, for Tete has been twice visited by small steam vessels. Senna, farther down the river, a neglected and unhealthy village, has suffered much from political mismanagement, and has ceaseless troubles with the Landeens or Zulus, who own the southern bank of the river and collect in force every year to exact a heavy tribute-money. The industrial possibilities of the lower Zambesi, and indeed of the whole river-system, are enormous. India-rubber, indigo, archil, beeswax, and calumba root are plentiful, and oil seeds and the sugar-cane could be produced in sufficient quantity to supply the whole of Europe.

The Zambesi region was known to the mediæval geographers as the empire of Monomotapa, and the course of the river, as well as the position of Lakes N'gami and Nyassa, was filled in with a rude approximation to accuracy in the earlier maps. These were probably constructed from Arab information. The first European to visit the upper Zambesi was Livingstone in his exploration from Bechuanaland between 1851 and 1853. Two or three years later he descended the Zambesi to its mouth and in the course of this journey discovered the Victoria Falls. In 1859, accompanied by Dr. Kirk (now Sir John Kirk), Livingstone ascended the river as far as the falls, after tracing the course of its main tributary the Shiré and discovering Lake Nyassa. The mouths of the Zambesi were long claimed exclusively by the Portuguese, but in 1888 the British Government opened negotiations with Portugal to have the river declared free to all nations. (H. D.)

ZAMORA, an inland province of Spain, one of the three into which the former province of Leon has since 1833 been divided, is bounded on the W. by Tras-os-

Montes (Portugal) and Orense, on the N. by Leon, on the E. by Valladolid, and on the S. by Salamanca; its area is 4135 square miles. It is traversed from east to west by the Douro, which receives within the province the Valderaduey and the Esla on the right and the Guareña on the left; the Tormes also skirts the south-western boundary for some 25 miles. Except in the northwest and west, where it is entered by spurs from the Cantabrian chain (Sierra de la Culebra and Sierra de Peña Negra), the province is flat; its lowest point is 1070 feet above sea-level. Its plains, especially the "tierra de campo" formed by the valley of the Esla, yield large quantities of grain and pulse; wine and flax are also produced; and on the higher grounds large numbers of merino sheep are fed. The industries of Zamora are unimportant. The province is traversed by no railway except that connecting its capital with Medina del Campo on the northern line. There are eight partidos judiciales and 300 ayuntamientos; besides ZAMORA (see below), the capital, there is only one town, the historic city of Toro (7754), with a population exceeding 5000. The total population of the province in 1877 was 250,000.

ZAMORA, capital of the above province, is situated 2000 feet above sea-level, on the right bank of the Douro (here crossed by a bridge of seventeen pointed arches) a little below its junction with the Valderaduey, 57 miles by rail west by north from Medina del Campo and 182 miles northwest from Madrid. The population in 1877 was 13,632. It has a small but fine Romanesque cathedral (completed about 1174) and an ancient castle, as well as several other interesting churches of the 12th century. It is the seat of a seminary and an academy of engineering, and has unimportant linen and woollen manufactures.

In the early period of the Christian re-conquest Zamora, from its position on the north of the Douro, was a place of considerable strategic importance. It was taken from the Arabs by Alonso the Catholic in 748, but was again held by them for short periods in 813, 939, 963, 984, and 986. It was entirely repaired by Ferdinand I., who in 1061 gave it to his daughter Doña Urraca. After his death in 1065 Sancho disputed possession with his sister and laid siege to the town, but without success, although the famous Ruy Diaz de Bivar was among his warriors, and indeed at this time received his title of El Cid Campeador. The town became subject to Alphouso VI. in 1073.

ZANESVILLE, a city of the United States, the county seat of Muskingum county, Ohio, is situated on both banks of the Muskingum river, at the mouth of Licking river, 170 miles northeast of Cincinnati and 37 nearly due south of Cleveland. The surrounding country is thickly populated, the inhabitants being engaged in agriculture and in coal and iron mining. Zanesville has railway communication by several lines. The population in 1880 was 18,113, showing a gain of about 80 per cent. since 1870.

Zanesville was founded about the beginning of the 19th century, and in 1804 was made the county seat. From 1810 to 1812 the Ohio legislature met at Zanesville. It was incorporated as a city in 1855. Its growth prior to 1870 was slow.[1]

ZANTE, the ancient ZACYNTHUS, an island of Greece, one of the Ionian group, in the Ionian Sea, in 37° 40′ N. lat. and 21° E. long., is 25 miles long, about 12 broad, and 64 miles round, with an area of 277 square miles, and a population in 1879 of 44,522, and estimated in 1887 at 48,000. Zante lies 8 miles south of Cephalonia, forming with it, Leucas, and Ithaca a crescent-shaped insular group, which represents the crests of a submerged limestone ridge facing the Gulf of Patras. At Ithaca, its northernmost member, the ridge almost touches the adjacent coast of Acarnania, with which it is geologically connected; and at Zante, its southernmost member, it recedes about 15 miles from the coast of Elis in Morea. Zante is of somewhat irregular oval shape, with its main axis disposed in the direction from northwest to southeast, and indented by a deep inlet at its southern extremity. The surface is mainly occupied by an extensive and highly productive central plain, skirted on the west side by a range of bare limestone hills from 1000 to 1200 feet high, which fall gently landwards, but present bold steep cliffs towards the sea, and which culminate northwards in Mount Skopos (1500 feet?), the highest point in the island. On the east side the plain is also limited by a low ridge, which still justifies the epithet of *nemorosa*, or the "wooded," applied by Virgil to Zacynthus. These hills are densely clothed to their summits with an exuberant growth of olives, figs, myrtles, laurels, oranges, aloes, vines, and other sub-tropical plants. Travellers sailing between this coast and the mainland describe in enthusiastic language the charming effect produced by these masses of evergreen vegetation rising in long terraces above the surrounding waters, and everywhere interspersed with pleasant homesteads and hamlets embowered in verdure. Nevertheless Zante, notwithstanding its Italian title of "Fior di Levante," is inferior in picturesque beauty to Corfu, owing to the less elevation of its hills and the somewhat monotonous character of the great central plain. This plain, however, is highly cultivated, forming an almost continuous stretch of gardens and vineyards, varied here and there with a few patches of cornfields and pasture lands. Here is grown a peculiar dwarf vine, whose fruit, the "currant" (from "Corinth") of commerce, forms the chief resource and staple export of Zante, as well of the neighboring mainland. In 1886 the currant crop for the whole of Greece was valued at £2,000,000 [$9,720,000], of which nearly one-fifth was raised in Zante, chiefly for the English market. The vine, which grows to a height of 3 feet, begins to yield in seven years and lasts for over a century. From the grape, which has a pleasant bitter-sweet taste, a wine is also extracted, which is said to excel all others in flavor, fire, and strength. Besides this species, there are nearly forty different kinds of vine and ten of the olive, including the *karudolia*, which yields the best eatable olive berry. For size, vigorous growth, and productiveness the olive tree of Zante is rivalled only by that of Corfu.

The island enjoys a healthy climate; and, although there are no perennial streams, an abundant supply of good water is obtained from the numerous springs, occurring especially in the eastern and central districts. But earthquakes are frequent and at times disastrous. During recent times the most destructive were those of 1811, 1820, and 1840; and, although the prevailing geological formations are sedimentary, chiefly calcareous, there seems no doubt that these disturbances are of igneous origin. Other indications of volcanic agency are the oil springs occurring on the coast, and even in the bed of the sea near Cape Skinari on the north side, and especially the famous pitch or bituminous wells already mentioned by Herodotus (*Hist.*, bk. iv.). These have been productive throughout the historic period and still yield a considerable supply of pitch. They are situated in a swamp near the coast village of Chieri, and comprise two basins, with alternate layers of water and bitumen, the lower sheet of water apparently communicating with the sea.

Zante, capital of the island, is a considerable seaport on the east side, with a population of 16,250 (1879). It occupies the site of the ancient city of Zacynthus, said to have been founded by Zacynthus, son of a legendary Arcadian chief, Dardanus, to whom was also attributed the neighboring citadel of Psophis. But of this, as well as of the temple of Diana that formerly crowned the summit of Mount Scopus, no vestiges can now be discovered.

Traditionally the island formed part of the territory of Ulysses, king of Ithaca, and at one time it appears to have also received a colony of Archæans from Peloponnesus. Later it joined the Athenian hegemony; but after the fall of Athens the democratic party was replaced by an oligarchy, which ruled in the interests of Sparta. Under the Romans Zacynthus was included in the province of Epirus, and passed in mediæval times successively from Byzantium to the Normans (11th century), the Orsini, counts of Cephalonia (after the 4th crusade), and the Tocco

[1] [John McIntyre, the founder of Zanesville, left a bequest, now worth over $300,000, for the benefit of free schools.—AM. ED.]

family, who held it with Cephalonia as vassals of the Neapolitan Angevine dynasty. In the 15th century it was occupied by the Venetians, and was held by them till the fall of the republic in 1797. Wrested in 1799 by the Russians from the French, it was soon after seized by the English, and in 1815 constituted with the other Ionian Islands a "septinsular republic" under British protection, till the union with Greece in 1864.

The long Venetian occupation is reflected in the appearance, character, and to some extent even the language and religion of the Zantiots. Nearly all the aristocracy claim Venetian descent; most of the upper classes are bilingual, speaking both Greek and Italian; and a considerable section of the population are Roman Catholics of the Latin rite. Even the bulk of the people, although mainly of Greek stock, form in their social usages a connecting link between the Hellenes, whose language they speak, and the Western nations by whom they were so long ruled. They have the reputation of being industrious and enterprising, but passionate and revengeful. But no more high-minded, enlightened, and courteous people can anywhere be found than in the circle of the Maddalenas, Terzettis, Mercatis, and other families of Venetian lineage.

See Balthazar Raimondini, *De Zacynthi Antiquitatibus;* C. Parrigopoulo, *Histoire de la Civilisation Hellénique;* S. de Nolhac, *La Dalmatie, les Îles Ioniennes*, etc., Paris, 1882.

ZANZIBAR, or, more correctly, ZANGUEBAR, a sultanate of east central Africa, which till recently comprised the four islands of Zanzibar, Pemba, Lamu, and Mafia (Monfia), together with the adjacent seaboard from about 3° N. to 10° S. lat., with undefined limits towards the interior. But by the Anglo-German convention, signed in London on 29th October, 1886, the territory on the mainland was restricted to the strip of coastlands ten nautical miles broad, stretching from the mouth of the Miningani river at the bay of Tunghi, just south of Cape Delgado, northwards to Kipini at the mouth of the Tana, together with the isolated stations of Kisimayu (Kismayu), Brava, Merka, and Magdoshu (Magadoxo) on the Somal coast, each with a land circuit of ten nautical miles, and Warsheikh on the same coast, with a land circuit of five nautical miles. Since then, however, further changes have taken place. The sultan's officers have been replaced in the seaports of Dar-es-Salaam and Pangani on the Zanzibar coast proper by commissioners of the German East African Association, to whom the customs of those places have been farmed; the port of Tunghi below Cape Delgado has been claimed and forcibly occupied (1887) by the Portuguese; the island of Pemba appears to have been ceded (May, 1888) to the recently chartered British East African Company; lastly, the station of Kisimayu on the Somal coast is claimed (June, 1888) by Italy in reparation of an affront offered to the Italian consul at Zanzibar. But, as defined by the above-mentioned convention, the reduced dominions of the sultan have areas (in square miles) and estimated populations (1887) as under:

	Area.	Population.
Island of Zanzibar	640	220,000
" " Pemba	380	10,000
" " Mafia	200	7,000
" " Lamu	50	20,000
Zanzibar coastlands	6000	500,000
Stations on Somal coast	150	8,000
Total	7420	765,000

The political and commercial, as well as the geographical, centre of the state is the fertile and densely peopled island of Zanzibar, which lies at a mean distance of 20 miles from the Swahili coast, between 5° 40′ and 6° 30′ S. lat. With the neighboring Pemba (to the north) and the more distant Mafia (to the south) it forms an independent geological system, resting on a foundation of coralline reefs, and constituting a sort of outer coast-line, which almost everywhere presents a rocky barrier to the fury of the waves rolling in from the Indian Ocean. All three are disposed parallel to the adjacent seaboard, from which they are separated by shallow waters, mostly under thirty fathoms, and strewn with numerous reefs dangerous to navigation, especially in the Mafia channel opposite the Rufiji delta.

Mafia itself is low and fertile, and extensively planted with cocoanut palms. It is continued southwards by an extensive reef, on which stands the chief village, Chobe, the residence of the governor and of a few Arab and Hindu (Banyan) traders. Chobe stands on a shallow creek inaccessible to shipping.

Zanzibar, the Unguya of the natives, is not exclusively of coralline formation, but also presents several heights of a reddish ferruginous clay, rising in gentle slopes above the central plains. In the south these heights nowhere exceed 400 or 450 feet; but on the northwest coast they develop a chain of hills disposed parallel to the shore and attaining an elevation of a little over 1000 feet. The forests by which the island was formerly covered have mostly disappeared, and the greater part of the rich soil is carefully cultivated, yielding two annual crops of corn, and four of manioc, the staple food of the people. There are extensive cocoanut groves, and from India and Malaysia have been introduced the mangosteen, guava, durian, cinnamon, nutmeg, and cloves, all of which thrive well. The soil seems specially suited for the clove, which, although nearly destroyed by the terrific cyclone of 1872, has already recovered from that disaster, and the annual export of this spice now exceeds £10,000 [$48,600] in value. Although the fauna is almost exclusively continental, Zanzibar till recently possessed a distinct variety of *Colobus* (*C. kirkii*), which appears to be now extinct.[1] Some years ago a hippopotamus visited the island from the mainland; but no carnivora are now found larger than the serval and wild cat.

On the east side of the island there still survive a few groups of Wa-Hadimu Bantus, who represent the aboriginal stock. But elsewhere, and especially in the capital (for which, see below), the population is of an extremely heterogeneous character, including full-blood and half-caste Arabs, Indian "Canarians" (that is, half-caste Portuguese from Kanara on the Malabar Coast of India), Swahili of every shade, slaves or freedmen from all parts of East Africa, Europeans, and Americans. (See SWAHILI.)

The neighboring island of Pemba, intersected by 5° S. lat., is even more fertile, but much less cultivated, than Zanzibar. From the luxuriant vegetation which everywhere clothes the cliffs to their summits it takes the name of the "Green." The land is exclusively owned by great Arab proprietors, who work their plantations with scarcely disguised slave labor and export considerable quantities of cloves, which here also find a congenial home. The capital, Shaki-Shaki, which lies at the head of a shallow creek on the west side, is inaccessible to shipping. But at Kishi-Kashi, at the northwest extremity, there is a deep and well-sheltered harbor, though of somewhat difficult approach. Here resides the chief of the Arab landed aristocracy, who has hitherto been more of a vassal than a subject of the sultan, and whose allegiance has lately been transferred to the British East African Association.

Lamu also, the fourth member of the sultan's former insular possessions, has ceased to fly the Zanzibar flag. It is a small flat island lying close to the mainland above the mouth of the Ozi branch of the Tana delta, and appears to be now incorporated in the adjacent German territory of Vitu land. Lamu, its capital, with a reported population of 15,000, has a fine harbor, formed by a long deep channel separating it from the neighboring island of Manda.

The Zanzibar seaboard (now more generally known as the Swahili coast) is a low-lying swampy and alluvial region, rising gently from the sea towards the first terraced escarpments of the continental plateau. Owing

[1] H. H. Johnston, *The Kilima-Njaro Expedition*, p. 38.

to the numerous streams reaching the coast along this seaboard — Rovuma, Ukeredi, Umbi-Kuru, Rufiji, Rufu, Wami, Umba, and others—a great part of the surface consists of rich alluvial soil, densely covered with a tropical vegetation. Here the warm currents setting landwards from the Indian Ocean bring both moisture and heat, so that this coast has a higher temperature and heavier rainfall than the Atlantic seaboard under the same parallels of latitude.[1] Thanks to these conditions, while the climate is oppressive and malarious, the vegetation is extremely luxuriant, assuming about the marshy deltas the aspect of an impenetrable jungle of mangroves, reeds, and tall grasses, growing to a height of 12 or 14 feet. A characteristic plant is the *msandarusi* or copal-tree of the lower Rufiji valley, which yields the best gum known to commerce. Other economic plants more or less extensively cultivated are rice, maize, millet, the cocoanut and oil palm, besides several European species already acclimatized at Bagamoyo and other stations. But nearly the whole of this region is well suited for raising tropical produce, such as sugar, coffee, cotton, indigo, cinnamon, cloves, and other spices.

Besides Dar-es-Salaam and Pangani, surrendered to the Germans (see above), the chief stations and seaports, going northwards, are Lindi, Kilwa (Quiloa), Bagamoyo, Mombasa (Mombas), and Malindi (Melinda). Of these Bagamoyo is at present the most important, as the starting-point of travellers and traders for the interior. Here are also the headquarters of the French Roman Catholic missions in east equatorial Africa, with training schools, extensive plantations, and gardens of acclimatization. Kilwa, Mombasa, and Malindi, great and flourishing emporiums under the Zenj empire, are now almost abandoned. This remark applies also to Magdoshu, the chief isolated station on the Somal coast belonging to Zanzibar.

From the earliest times of which there is any authentic record the whole of the seaboard from the Somal coast to an unknown distance southwards was comprised within the dominions of the Zenj (Zang) potentates, who for centuries claimed and vindicated the title of "sovereign of the sea." From them the seaboard itself took the name of *zanguebar*,[2] the Balíd-ez-Zenj, or "Land of the Zenj" of the Arabs, a term which thus corresponds to the Hindu-bar, or "land of the Hindu," formerly applied to the west coast of India on the opposite side of the intervening Arabian Sea. By Ibn Batuta and other Arab writers the Zenj people themselves are spoken of in a general way as Mohammedan Negroes; and they are no doubt still represented by the semi-civilized and highly intelligent Mohammedan Bantus now collectively known as the Swahili or "coast people." Their empire began to decline soon after the appearance of the Portuguese in the eastern waters towards the close of the 15th century. To them fell in rapid succession the great cities of Kilwa with its 300 mosques (1505), Mombasa the "Magnificent" (1505), and soon after Malindi and Magdoshu the "Immense" (Ibn Batuta). On the ruins of the Portuguese power in the 17th century was built up that of the imams of Muscat, who ruled over a great part of south Arabia and the whole of the Zanzibar coast for over a century and a half down to 1856. On the death of the imam, or rather the "sayyid," Said of Muscat in that year his dominions were divided between his two sons, the African section falling to Majid, who was succeeded in 1870 by his younger brother Bargash ibn Said, commonly known as sultan of Zanzibar. He lived long enough to witness the recent dismemberment of his dominions, and in March, 1888, left to his son and successor, Sayyid Khalif, a mere fragment of the former powerful Mohammedan empire on the East-African seaboard. The administration of the "ten-mile zone" on the mainland, although reserved to the sultan by the Anglo-German convention of 1886, was practically surrendered to the Germans in August, 1888, when the German East African Company hoisted their flag jointly with the sultan's at fourteen ports along this seaboard.

[1] Mean temperature of the West and East Coasts 72° and 80° Fahr. respectively; average annual rainfall at Zanzibar 60 inches; at Loanda (Atlantic side) 36 inches; rainfall at Zanzibar in 1859 (exceptional) 170 inches.

[2] Mispronounced *Zanzibar* by the local Banyans and other Indian traders.

ZANZIBAR, capital of the island and state of the same name, is the largest city on the African seaboard next to Alexandria and Tunis. It lies in sheltered waters, from 30 to 40 feet deep, on the west side of the island, in 6° 10′ S. lat., about 25 miles northeast of Bagamoyo, its port on the mainland. It comprises two distinct quarters,—Shangani, the centre of trade and residence of the sultan, and the eastern suburb occupied by the lowest classes (fishermen, porters, slaves, etc.), with a total joint population estimated in 1887 at about 100,000. Viewed from the sea, the place presents a pleasant prospect with its glittering mosques, palace, white houses, barracks, forts, and round towers. But the interior is a labyrinth of narrow filthy streets, winding though a dense mass of hovels, a "cesspool of wickedness Oriental in its appearance, Mohammedan in its religion, Arabian in its morals, ... a fit capital for the Dark Continent."[3] Nevertheless Zanzibar, which is now regularly visited by several lines of ocean steamers, is the necessary centre of trade for the eastern seaboard, the focus of all exploring and missionary work for the interior, the portal through which civilizing influences have hitherto penetrated into the eastern section of equatorial Africa. The imports, chiefly raw and bleached cottons and European wares, were valued at £1,220,000 [$5,929,200] in 1883, the exports at £800,000 [$3,888,000], of which £215,000 [$1,044,900] represented ivory, £153,000 [$743,580] caoutchouc, £13,000 [$63,180] sesame seed, £10,600 [$51,516] cloves. In 1885 the port was visited by 124 vessels of 115,500 tons, of which 49 of 60,674 tons were British. There are several Protestant and Roman Catholic missions stationed in Zanzibar, the health of which has been much improved by a recently constructed aqueduct yielding a good supply of pure water.

ZARA (Slav. *Zadar*), an Austrian seaport, the capital of Dalmatia, and the seat of a Roman Catholic archbishop and of a Greek bishop, lies on the Adriatic, 130 miles southeast of Trieste, opposite the islands of Ugliano and Pasman, from which it is separated by the narrow Channel of Zara. The promontory on which it stands is separated from the mainland by a deep moat, practically making an island of the site of the city. Down to 1873, Zara was strongly fortified; but its ramparts have now been converted into elevated promenades, which command extensive views to seaward and to landward. Of its four old gates one, the Porta Marina, incorporates the relics of a Roman arch, and another, the Porta di Terraferma, was designed by Sanmichele. The general aspect of the town, which is oval in form, is thoroughly Venetian. The main streets, dividing it into four quarters, are straight and wide, but the side-streets are ill-paved and narrow. The chief interest of Zara lies in its churches, the most remarkable of which is the cathedral of St. Anastasia, a fine Romanesque basilica, founded by Doge Enrico Dandolo after the capture of the town in 1202 and finished in 1205. The churches of St. Chrysogonus and St. Simeon are also in the Romanesque style, and St. Mary's retains a fine Romanesque campanile of 1105. The old octagonal church of St. Donatus, traditionally (but in all probability erroneously) said to have been erected in the 9th century on the site of a temple of Juno, has been converted to secular purposes. Most of the Roman remains were used up in the construction of the fortifications. But two squares are embellished with lofty marble columns; a Roman tower stands on the east side of the town; and some remains of a Roman aqueduct may be seen outside the ramparts. Among the other chief buildings are the

[3] Prof. H. Drummond, *Tropical Africa*, p. 5.

Loggia del Comune, rebuilt in 1565, containing a public library of 34,000 volumes; the old palace of the priors, now the governor's residence; and the episcopal palace. The harbor, to the northeast of the town, is safe and spacious, and it is annually entered by about 1200 vessels, of 185,000 tons, mainly engaged in the coasting trade. The chief industry is the preparation of maraschino, made from the marasco, or wild cherry, which covers the hills of Dalmatia. About 340,000 bottles of this liqueur are exported annually. Glass-making and fishing are also carried on. The population of the town in 1881 was 11,861, of the commune 24,536. Almost all of these are of Italian descent, and Italian is practically the only language spoken in the town.

The foundation of Zara is ascribed by tradition to the Liburni. In the early days of the Roman empire it became a flourishing Roman colony under the name of *Jadera*, subsequently changed to *Diadora*. It remained united with the Eastern empire down to about the year 1000, when it sought the Venetian protection. For the next four centuries it was a bone of contention between Venice and Hungary, changing hands repeatedly. It was occupied by the Hungarians at the end of the 12th century, but was recaptured by the Venetians in 1202, with the aid of French crusaders on their way to the Holy Land. In 1409 it was finally purchased from Hungary by the island republic for 100,000 ducats [$226,800]. In 1792 it passed, with Venice, into the possession of Austria. From 1809 to 1813 it belonged to France.

About 15 miles to the southeast lies Zara Vecchia, or Old Zara, an insignificant village on the site of Biograd (White Town), formerly the residence of the Croatian kings, but destroyed during the Hungarian-Venetian wars.

Comp. *Zara, e suoi Dintorni* (Zara, 1878), and *Notize Storiche della Città di Zara* (Zara, 1883), both by Angelo Nani.

ZARAGOZA, or SARAGOSSA, an inland province of Spain, one of the three into which Aragon is now divided, is bounded on the N.E. and E. by Huesca, Lerida, and Tarragona, on the S. by Teruel and Guadalajara, and on the W. by Soria and Navarre; the area is 6607 square miles. It belongs wholly to the basin of the Ebro, by which river it is traversed from northwest to southeast. The main valley is bounded on the S.W. by the Sierra de Moncayo, which reaches a maximum elevation—the highest in the province—of 7700 feet, and is continued in a southeasterly direction by the lower sierras of La Virgen and Vicor; on the northwest are the spurs of the Pyrenees. The principal tributaries of the Ebro within the province are the Jalón, Huerva, and Aguas on the right and the Arva and Gállego on the left; the Aragon also, which flows principally through Navarre, has part of its course in the north of this province. At its lowest point, where the Ebro quits it, Zaragoza is only 105 feet above sea-level. The soil is in its level portions comparatively fertile, the chief productions being wheat, rye, barley, oats, hemp, flax, oil, and wine. Silkworms are bred; and on the higher grounds sheep are reared. There are considerable forests on the lower mountain slopes. Zaragoza has no manufactures of importance. The province is traversed by the Ebro Valley Railway, which connects Miranda on the northern line with Lerida, Barcelona, and Tarragona, and has a branch to Huesca; it also has communication with Madrid; and there are local lines to Cariñena (southwest from Zaragoza) and to Puebla de Hijar (along the right bank of the Ebro). The Aragon Canal, originally intended to connect the Mediterranean with the Atlantic, is open from Tudela (El Bocal) to a point below Zaragoza. There are 13 partidos judiciales and 312 ayuntamientos; of these only Calatayud (11,512) and ZARAGOZA (see below) have more than 10,000 inhabitants. The total population of the province in 1877 was 400,587.

ZARAGOZA, capital of the above province, formerly capital of the kingdom of Aragon, lies at a height of 600 feet above sea-level, on a rich plain on the right bank of the Ebro, just above its confluence with the Huerva, 212 miles by rail to the northeast of Madrid. The river is here crossed by a fine stone bridge of seven arches, erected in 1437, and another bridge—of iron—much needed for the convenience of through railway traffic is projected. Seen from a distance, the city with its numerous domes and towers has an imposing appearance, which it hardly maintains on a nearer approach. The older streets are narrow, gloomy and ill paved; the massive buildings formerly inhabited

by the Aragonese nobility are either in ruins or turned into wood-stores and granaries; and an air of poverty and decay pervades the whole town. By the river side there are public walks and avenues of poplar. The two most important buildings of Zaragoza are its cathedrals, in each of which the chapter resides alternately for six months. La Seo ("The See") is the older of the two, dating chiefly from the 14th century; its prevailing style is Gothic, but the oldest portion, the lower portion of the apse, is Byzantine, and the façade is of the Late Pseudo-Classical style, by which so many churches in Spain have been disfigured. The Iglesia Metropolitana del Pilar is the larger and more modern building, dating only from the latter half of the 17th century; it was built after designs by Herrera el Mozo, and owes its name to one of the most venerated objects in Spain, the "pillar" of jasper on which the Virgin is said to have alighted when she manifested herself to Santiago as he passed through Zaragoza. It has no architectural merit; externally its most conspicuous features are its domes, which are decorated with rows of green, yellow, and white glazed tiles. The church of San Pablo dates mainly from the 13th century. Adjoining the church of San Felipe is the Torre Nueva, an octangular clock tower in diapered brickwork, dating from 1504; it leans some 9 or 10 feet from the perpendicular, owing to faulty foundations. Among other conspicuous public buildings are the municipal buildings, the exchange (*Lonja*), and the civil and military hospitals, which are among the largest in Spain. The university was founded in 1474, but its history has not been brilliant. To the west of the town is the Aljaferia or old citadel, an irregular pile originally built as a palace by the Moors and also used as such by its Christian owners. It was afterwards assigned by Ferdinand and Isabella to the Inquisition, and has since been used as barracks, a military hospital, and a prison; it is now unoccupied and falling into decay. The chief manufactures of Zaragoza are silk, woollen cloth, leather, saltpetre, soap, and chocolate; and there is considerable trade in agri-

cultural produce, and in wine and spirits. The population of the town in 1877 was 84,575.

Zaragoza, the Celtiberian *Salduba*, was colonized at the close of the Cantabrian War (25 B.C.) by Augustus, who gave it his own name, *Cæsarea Augusta* or *Cæsaraugusta*. It was a colonia immunis and the seat of a conventus juridicus. No remains of the ancient city have been preserved. It was taken by the Goths about 466 and in 712 by the Moors. In 1118 it was recovered by Alonso el Batallador of Aragon after a siege of five years, during which the defenders were reduced by famine to the direst straits. In 1710 Stanhope defeated the French under Philip V. not far from the town. The most memorable recent events in the history of Zaragoza are those which took place during the Napoleonic invasion. In 1808 the citizens rose against the French, and, under the command of PALAFOX (*q.v.*), defended the town for two months. The first siege was raised on 15th August, 1808; but the respite then gained was not made use of to strengthen the defences, and when the enemy renewed their attack in greater force in December, the place was compelled to surrender (20th February, 1809), after losing in all nearly 60,000 men.

ZARLINO, GIOSEFFE or GIUSEPPE (1517–1590),[1] musical theorist, surnamed from his birthplace, ZARLINUS CLODIENSIS, was born at Chioggia, Venetia, in 1517. Studying in his youth for the church, he was admitted to the minor orders in 1539 and ordained deacon in 1541 at Venice; but he soon devoted himself entirely to the study of music under the guidance of Adrian Willaert, then choir-master at St. Mark's. Willaert, dying in 1562, was succeeded by Cipriano di Rore, on whose removal to Parma in 1565 Zarlino was elected choir-master. Though now remembered chiefly as a theorist, it is evident that he must have been famous both as a practical musician and as a composer; for, notwithstanding the limited number of his printed works, consisting of a volume entitled *Modulationes Sex Vocum* (Venice, 1566), and a few motets and madrigals, scattered through the collections of Scotto and other contemporary publishers, he both produced and superintended the public performance of some important pieces in the service of the republic. First among these was the music written to celebrate the battle of Lepanto (7th October, 1571). Again, when Henry III. of France passed through Venice on his return from Poland in 1574, Zarlino directed on board the "Bucentaur" the performance of an ode for which he himself had composed the music, to verses supplied by Rocco Benedetti and Cornelio Frangipani. The ode was followed by a solemn service in St. Mark's, in which Zarlino's music formed a prominent feature, and the festival concluded with the representation of a dramatic piece entitled *Orfeo* composed by Zarlino. When the church of S. Maria della Salute was founded in 1577 to commemorate the plague, he composed a solemn mass for the occasion. Not one of these works is now known to be in existence; the only example we possess of Zarlino's compositions on a grand scale is a MS. mass for four voices, in the library of the Philharmonic Lyceum at Bologna. He died at Venice on 14th February, 1590.

Fortunately for the science of music, Zarlino's theoretical writings have all been preserved. Though he was by no means free from certain visionary ideas concerning the transcendental powers of music, in which the theorists of the 16th century delighted, Zarlino was, in practical knowledge and intelligent application of scientific truth to the development of art, immeasurably in advance of the age in which he lived. His clear insight into the mathematical foundation of the scale placed him in direct antagonism to the leaders of the school of the Renaissance, which, with Vincenzo Galilei at its head, blindly followed the mistaken reasoning of Boetius (see vol. xvii. p. 87), and adhered as a matter of principle to the Pythagorean section of the canon. This difference of opinion, occurring at a critical period in the development of art, made Zarlino many bitter enemies; but he steadily maintained his principles in temperate and unanswerable argument; and his theory is now accepted as the basis of modern art, while that of his opponents is utterly discarded.

Zarlino's first theoretical work was the *Istitutioni Armoniche* (Venice, 1558; reprinted 1562 and 1573). This was followed by the *Dimostrationi Armoniche* (Venice, 1571; reprinted 1573) and by the *Sopplimenti Musicali* (Venice, 1588). Finally, in a complete edition of his works published shortly before his death Zarlino reprinted these three treatises, accompanied by a *Tract on Patience*, a *Discourse on the True Date of the Crucifixion of Our Lord*, an essay on *The Origin of the Capuchins*, and the *Resolution of Some Doubts Concerning the Correction of the Julian Calendar* (Venice, 1589)[2]

The *Istitutioni* and *Dimostrationi Armoniche* deal, like most other theoretical works of the period, with the whole science of music as it was understood in the 16th century. The earlier chapters, treating chiefly of the arithmetical foundations of the science, differ but little in their line of argument from the principles laid down by Pietro Aron, Zacconi, and other early writers of the Boetian school; but in bk. ii. of the *Istitutioni* Zarlino boldly attacks the false system of tonality to which the proportions of the Pythagorean tetrachord, if strictly carried out in practice, must inevitably lead. The fact that, so far as can now be ascertained, they never were strictly carried out in the Italian mediæval schools, at least after the invention of counterpoint, in no wise diminishes the force of the reformer's argument. The point at issue was, that neither in the polyphonic school, in which Zarlino was educated, nor in the later monodic school, of which his recalcitrant pupil, Vincenzo Galilei, was the most redoubtable champion, could those proportions be tolerated in practice, however attractive they might be to the theorist in their mathematical aspect. So persistently does the human ear rebel against the division of the tetrachord into two greater tones and a leimma or hemitone, as represented by the fractions $\frac{8}{9}$, $\frac{8}{9}$, $\frac{243}{256}$, that, centuries before the possibility of reconciling the demands of the ear with those of exact science was satisfactorily demonstrated, the Aristoxenian school advocated the use of an empirical scale, sounding pleasant to the sense, in preference to an unpleasing tonality founded upon immutable proportions. Didymus, writing in the year 60, made the first step towards establishing this pleasant-sounding scale upon a mathematical basis, by the discovery of the lesser tone; but unhappily he placed it in a false position below the greater tone. Claudius Ptolemy (130) rectified this error, and in the so-called syntonous or intense diatonic scale reduced the proportions of his tetrachord to $\frac{8}{9}$, $\frac{9}{10}$, $\frac{15}{16}$,—*i.e.*, the greater tone, lesser tone, and diatonic semitone of modern music.[3] Ptolemy set forth this system as one of eight possible forms of the diatonic scale. But Zarlino uncompromisingly declared that the syntonous or intense diatonic scale was the only form that could reasonably be sung; and in proof of its perfection he exhibited the exact arrangement of its various diatonic intervals, to the fifth inclusive, in every part of the diapason or octave. The proportions are precisely those now universally accepted in the system called "just intonation." But this system is practicable only by the voice and instruments of the violin class. For keyed or fretted instruments a compromise is indispensable. To meet this exigency, Zarlino proposed that for the lute the octave should be divided into twelve equal semitones; and after centuries of discussion this system of "equal temperament" has, within the last thirty-five years, been universally adopted as the best attainable for keyed instruments of every description.[4]

Again, Zarlino was in advance of his age is his classification of the ecclesiastical modes. These scales were not, as is vulgarly supposed, wholly abolished in favor of our modern tonality in the 17th century. Eight of them, it is true, fell into disuse; but the mediæval Ionian and Hypoionian modes are absolutely identical with the modern natural scale of C; and the Æolian and Hypoæolian modes differ from our minor scale, not in constitution, but in treatment only. Mediæval composers, however, regarded the Ionian mode as the least perfect of the series and placed it last in order. Zarlino thought differently and made it the first mode, changing all the others to accord with it. His numerical table, therefore, differs from all others

[1] Burney and Hawkins place Zarlino's birth in 1540, and his death in 1590. Caffi gives the true dates. Zarlino himself tells us that he was ordained deacon in 1541.

[2] Ambros mentions an edition of the *Istitutioni* dated 1557, and one of the *Dimostrationi* dated 1562. The present writer has never met with either.

[3] We have given the fractions in the order in which they occur in the modern system. Ptolemy, following the invariable Greek method, placed them thus—$\frac{8}{9}$, $\frac{8}{9}$, $\frac{9}{10}$. This, however, made no difference in the actual proportions.

[4] It was first used in France, for the organ, in 1835; in England, for the pianoforte in 1846 and for the organ in 1854. Bach had advocated it in Germany a century earlier; but it was not generally adopted.

made before or since, prophetically assigning the place of honor to the one ancient scale now recognized as the foundation of the modern tonal system.

These innovations were violently opposed by the apostles of the monodic school. Vincenzo Galilei led the attack in a tract entitled *Discorso Intorno alle Opere di Messer Gioseffe Zarlino*, and followed it up in his famous *Dialogo*, defending the Pythagorean system in very unmeasured language. It was in answer to these strictures that Zarlino published his *Sopplementi*.

ZEA. See CEOS.

ZEALAND, or SJAELLAND, the largest and most easterly island of DENMARK (*q.v.*), is separated from Fünen on the west by the Great Belt and from Sweden on the east by the Sound; its greatest length from north to south is 81 miles, its breath 65, and its area 2636 square miles.[1] Its surface is for the most part undulating, but on the whole little above sea level; the highest elevations are in the southeast, where Cretaceous hills (the oldest geological formation on the island) reach heights of upwards of 350 feet. The coast is indented by numerous deep bays and fjords: the Ise fjord in the north in particular, with its branches the Roeskilde fjord on the east and the Lamme fjord on the west, penetrates inland for about 40 miles. There are no rivers of importance; but several large lakes, the most considerable being Arre and Esrom, occur in the northeast. The soil is fertile and produces grain, especially rye and barley, in great abundance, as well as potatoes and other vegetables and fruit. Agricultural and cattle-raising, along with some fishing, are the leading occupations of the inhabitants; linen is almost the only article of domestic industry. The population in 1880 was 610,000. The principal towns, besides COPENHAGEN (*q.v.*), the capital (234,850 inhabitants in 1880), are Roeskilde (5893), formerly the capital and still the see of the primate; Elsinore (8978); Slagelse (6076), a great agricultural centre; Sorö (1464), formerly the seat of a university and still educationally important; and Korsör (3954), the port for mail steamers to the mainland, connected by rail with Sorö, Roeskilde, and Copenhagen.

ZEALAND, the most westerly province of Holland, is bounded on the north by South Holland, on the east by North Brabant and Belgium, on the southeast and south by Belgium, and on the west by the North Sea. Its area is 689 square miles, the greater part of which consists of the islands Schouwen, Duiveland, St. Philipsland, Tholen, North, South, and East Beveland, Wolfaartsdyk, and Walcheren. The greater part of the surface is below sea-level. The westward coasts of Schouwen and Walcheren are partly sheltered by dunes; but the province is mainly dependent for protection from the sea on its artificial dikes, which have a total length of 300 miles, and on the repair of which upwards of £80,000 [$388,800] is spent annually. The soil consists of a fertile sea clay (see vol. xii. p. 64), which specially favors the production of wheat; much rye is also cultivated, as well as barley (for malting), beans and pease, flax, and madder. Cattle and swine are reared, and dairy produce is largely exported; but the sheep of the province are small and their wool indifferent. The industries (linen, yarn-spinning, distilling, brewing, salt-refining, ship building) are comparatively unimportant. The inhabitants, who still retain many quaint and archaic peculiarities of manner and dress, speak the variety of Dutch known as Low Frankish (see vol. xii. p. 87). The capital is Middleburg (population 16,378 in 1887), in Walcheren, where also is Flushing (12,005). The total population of the province in 1887 was 198,567.

ZEBRA. In the article HORSE (vol. xii. p. 179) the general zoological and anatomical characters of the genus *Equus*, and its relationship to other animals, were fully described. Among the existing species mention was made of certain forms distinguished from the rest by the peculiar coloration, being marked by conspicuous dark stripes on a lighter ground, and by their exclusively African habitat. These are the QUAGGA (see vol. xx. pp. 152–3) and two, if not three, distinct species to which the name zebra is commonly applied. The animal of this group which was first known to Europeans and was formerly considered the most common, is the True Zebra (*Equus zebra*, Linn.), sometimes called the Mountain Zebra. It inhabits the mountainous regions of the Cape Colony; but now, owing to the advances of civilized man into its somewhat restricted range, it has become very scarce, and is even, like its ally the quagga, threatened with extermination at no distant date. The second species, Burchell's Zebra (*Equus burchelli*, Gray), still roams in large herds over the plains to the north of the Orange river, but in yearly diminishing numbers. Both species are subject to considerable individual variations in marking, but the following are the principal characters by which they can be distinguished.

Equus zebra is the smaller of the two (about 4 feet high at the shoulders), and has longer ears, a tail more scantily clothed with hair, and a shorter mane. The general ground

FIG. 1.—True or mountain zebra (*Equus zebra*).

color is white, and the stripes are black; the lower part of the face is bright brown. With the exception of the abdomen and the inside of the thighs, the whole of the surface is covered with stripes, the legs having narrow transverse bars reaching quite to the hoofs, and the base of the tail being also barred. The outsides of the ears have a white tip and a broad black mark occupying the greater part of the surface, but are white at the base. Perhaps the most constant and obvious distinction between this species and the next is the arrangement of the stripes on the hinder part of the back, where there are a number of short transverse bands reaching to the median longitudinal dorsal stripe, and unconnected with the uppermost of the broad stripes which pass obliquely across the haunch from the flanks towards the root of the tail. There is often a median longitudinal stripe under the chest.

Equus burchelli is a rather larger and more robust animal, with smaller ears, a longer mane, and fuller tail. The general ground color of the body is pale yellowish brown, the limbs nearly white, the stripes dark brown or black. In the typical form they do not extend on to the limbs or the tail; but there is a great variation in this respect, even in animals of the same herd, some being striped quite down to the hoofs (this form has been named *E. chapmanni*). There is a strongly marked median longitudinal ventral black stripe, to which the lower ends of the transverse side stripes are usually united, but the dorsal stripe (also strongly marked) is completely isolated in its posterior half, and the uppermost of the broad haunch stripes runs nearly parallel to it. A much larger proportion of the ears is white than in the other species. In the middle of the wide intervals between

[1] The province of Zealand and Möen, which includes the island of Samsö as well as that of Möen, has an area of 2828 square miles and a population of 721,703; the "stift" or bishopric of Zealand includes also the island of Bornholm.

the broad black stripes of the flanks and haunches fainter stripes are generally seen.

E. grevyi.—Under this name a zebra has lately been described which was sent in 1882 to Paris from the Galla country, lying to the south of Abyssinia, the most northern locality in which zebras have hitherto been met with. In most of its characters it resembles *E. zebra*, but the stripes are finer and more numerous than in the typical examples of that species, and it has a strong, black, and isolated dorsal stripe. Considering the great variations that are met

FIG. 2.—Burchell's zebra (*E. burchelli*).

with in the markings of animals of this group, it is doubtful whether the aberrant characters of this individual are sufficient to separate it specifically from the true zebra of South Africa. The question will be cleared up when any complete scientific examination has been made of other specimens, and also of the zebras which are known to exist in the neighborhood of Lake Nyanza, and which are apparently of the same form. It is curious that the most northern and the most southern of the districts inhabited by zebras both contain identical or closely allied species, while the intermediate territory is occupied by a totally different form, *E. burchelli*. It should be mentioned that the last-named animal is generally spoken of as the "quagga" by colonists and hunters. Its flesh is relished by the natives as food, and its hide is very valuable for leather. Although the many attempts that have been made to break in and train zebras for riding or driving have sometimes been rewarded with partial success, the animal has never been domesticated in the true sense of the word. (W. H. F.)

ZEBULUN (זְבוּלֻן), one of the twelve tribes of Israel, derived, according to Gen. xxx. 20, from the sixth son of Leah. The verse offers two etymologies of the name, from the roots ZBD, "give," and ZBL, "inhabit." The form Ζαβουλων (LXX.), with *ô* in the last syllable, agrees with the vocalization of the adjective זְבוּלֹנִי, "Zebulonite." The country of Zebulun lay in the fertile hilly country to the north of the plain of Jezreel, which forms the first step towards the mountains of Asher and Naphtali, and included the goodly upland plain of Battauf. The description of its boundaries in Josh. xix. 10 *sq.* contains few names that can be identified with any certainty: Chisloth-tabor is apparently the modern Iksâl, a little to the west of Tabor, Daberath the modern Dabûrîya, at the foot of Tabor, Gath-hepher (A.V. Gittah-hepher) the village of Al-Meshhed, and Remmon Rummâna. Thus the eastern boundary laid down in Conder and Kitchener's reduced Ordnance Survey map comes too near the Lake of Tiberias. The west boundary is not defined in Josh. xix., but should agree with the somewhat vague east boundary of Asher in verse 27. At one period Zebulun must have reached the sea and bordered on Phœnician territory (Gen. xlix. 13, Deut. xxxiii. 18, 19). In the latter passage allusion is made to a feast upon a sacred mountain (Mount Tabor?) held by Zebulun and Issachar in common, and to the wealth these tribes derived from commerce by sea. Zebulun had a chief part in the war with Sisera (Jud. iv. 6); it furnished one of the judges, Elon the Zebulonite (Jud. xii. 11, 12); and the prophet Jonah, who foretold the victories of Jeroboam II., came from the town of Gath-hepher (2 Kings xiv. 25). The captivity of the northern tribes under Tiglath Pileser (2 Kings xv. 29) appears to have included Zebulun (Isa. ix. 1 [viii. 23]). Nazareth lay within the territory of Zebulun, but is not mentioned in the Old Testament.

ZECHARIAH, son of Berechiah, son of Iddo, or by contraction son of Iddo, appeared as a prophet in Jerusalem along with HAGGAI (*q.v.*), in the second year of Darius Hystaspes (520 B.C.), to warn and encourage the Jews to address themselves at length to the restoration of the temple, which, since their return from exile eighteen years before, had lain unaccomplished, less through want of zeal than through the pressure of unfavorable circumstances. Supported by the prophets, Zerubbabel and Joshua set about the work, and the elders of Judah built and the work went forward (Ezra v. 1 *sq.*, vi. 14). The first eight chapters of the book of Zechariah exactly fit into this historical setting. They are divided by precise chronological headings into three sections,—(*a*) chap. i. 1-6, in the eighth month of the second year of Darius; (*b*) chap. i. 7–vi. 15, on the twenty-fourth day of the eleventh month of the same year; (*c*) chap. vii.–viii., on the fourth day of the ninth month of the fourth year of Darius. The first section is a preface containing exhortation in general terms. The main section is the second, containing a series of night visions, the significant features of which are pointed out by an angel who stands by the prophet and answers his questions.

i. 7–17. The divine chariots and horses that make the round of the world by Jehovah's orders return to the heavenly palace and report that there is still no movement among the nations, no sign of the Messianic crisis. Seventy years have passed, and Zion and the cities of Judah still mourn. Sad news! but Jehovah gives a comfortable assurance of His gracious return to Jerusalem and the rebuilding of His temple,

i. 18–21 (Heb. ii. 1–4). Four horns, representing the hostile world-power that oppresses Israel and Jerusalem, are routed by four smiths.

ii. 1–13 (Heb. ii. 5–17). The new Jerusalem is laid out with the measuring line. It is to have no walls, that its population may not be limited, and it needs none, for Jehovah is its protection. The catastrophe of the nations is near to come; then the exiles of Zion shall stream back from all quarters, the converted heathen shall join them, Jehovah Himself will dwell in the midst of them, even now He stirs Himself from His holy habitation.

iii. 1–10. The high priest Joshua is accused before Jehovah by Satan, but is acquitted and given rule in Jehovah's house and courts, with the right of access to Jehovah in priestly intercession. The restoration of the temple and its service is a pledge of still higher things. The promised "branch" (or "shoot," צֶמַח), the Messiah, will come: *i.e.*, the Persian lordship has an end; the national kingdom is restored in its old splendor; and a time of general felicity dawns, when every man shall sit happy under his vine and under his fig tree. As by rights the Messianic kingdom should follow immediately on the exile, it is probable that the prophet designs to hint in a guarded way that Zerubbabel, who in all other places is mentioned along with Joshua, is on the point of ascending the throne of his ancestor David. The jewel with seven facets is already there, only the inscription has still to be engraved on it (iii. 9). The charges brought against the high priest consist simply in the obstacles that have hitherto impeded the restoration of the temple and its service; and in like manner the guilt of the land (iii. 9) is simply the still continuing domination of foreigners.

iv. 1–14. Beside a lighted golden candlestick of seven branches stand two olive trees—Zerubbabel and Joshua, the two anointed ones—specially watched over by Him whose seven eyes run through the whole earth. This explanation of the vision is separated from the description by an animated dialogue, not quite clear in its expression, in which it is said that the mountain of obstacles shall disappear before Zerubbabel, and that, having begun the build-

ing of the temple, he shall also bring it to an end in spite of those who now mock at the day of small beginnings.

v. 1–4. A written roll flies over the Holy Land; this is a concrete representation of the curse which in future will fall of itself on all crime, so that, *e.g.*, no man who has suffered theft will have occasion himself to pronounce a curse against the thief (*cf.* Jud. xvii. 2).

v. 5–11. Guilt, personified as a woman, is cast into an epha-measure with a heavy lid and carried from Judah to Chaldæa, where it is to have its home for the future.

vi. 1–8. The divine teams, four in number, again traverse the world toward the four winds, to execute Jehovah's commands. That which goes northward is charged to wreak His anger on the north country. The series of visions has now reached its close, returning to its starting-point in i. 7 *sqq.*

An appendix follows (vi. 9–15). Jews from Babylon have brought gold and silver to Jerusalem; of these the prophet must make a crown designed for the "branch" who is to build Jehovah's house and sit king on the throne, but retain a good understanding with the high priest. Zerubbabel is certainly meant here, and, if the received text names Joshua instead of him (vi. 11), this is only a correction, made for reasons easy to understand, but which breaks the context and destroys the sense and the reference of "them both" in verse 13.

The third section (chaps. vii.–viii.), dated from the fourth year of Darius, contains an inquiry whether the fast days that arose in the captivity are still to be observed, with a comforting and encouraging reply of the prophet.

Thus throughout the first eight chapters the scene is Jerusalem in the early part of the reign of Darius. Zerubbabel and Joshua, the prince and the priest, are the leaders of the community. But, while the spiritual head is in office, the authority of the civil head is rather moral than official, and is not so much actual as hoped for. The great concern of the time and the chief practical theme of these chapters is the building of the temple; but its restoration is only the earnest of greater things to follow, viz., the glorious restoration of David's kingdom. The horizon of these prophecies is everywhere limited by the narrow conditions of the time, and their aim is clearly seen. The visions hardly veil the thought, and the mode of expression is usually simple, except in the Messianic passages, where the tortuousness and obscurity are perhaps intentional. Noteworthy is the affinity between some notions evidently not framed by the prophet himself and the prologue to Job,—the heavenly hosts that wander through the earth and bring back their report to Jehovah's throne, the figure of Satan, the idea that suffering and calamity are evidences of guilt and of accusations presented before God.

Passing from chaps. i.–viii. to chaps. ix. *sq.*, we at once feel ourselves transported into a different world.

Jehovah's word is accomplished on Syria-Phœnicia and Philistia; and then the Messianic kingdom begins in Zion, and the Israelites detained among the heathen, Judah and Ephraim combined, receive a part in it. The might of the sons of Javan is broken in battle against this kingdom (ch. ix.). After an intermezzo of three verses (x. 1–3: "Ask rain of Jehovah, not of the diviners") a second and quite analogous Messianic prophecy follows. The foreign tyrants fall; the lordship of Assyria and Egypt has an end; the autonomy and martial power of the nation are restored. The scattered exiles return as citizens of the new theocracy, all obstacles in their way parting asunder as when the waves of the Red Sea gave passage to Israel at the founding of the old theocracy (x. 3–12). Again there is an interlude of three verses (xi. 1–3): fire seizes the cedars of Lebanon and the oaks of Bashan, which the rabbins refer to the burning of the sanctuary of Jerusalem.[1] The difficult passage about the shepherds follows.

The shepherds (rulers) of the nation make their flock an article of trade and treat the sheep as sheep for the shambles. Therefore the inhabited world shall fall a sacrifice to the tyranny of its kings, while Israel is delivered to a shepherd who feeds the sheep for those who make a trade of the flock (כְּנַעֲנֵי הַצֹּאן, xi. 7, 11 = "they that sell them," ver. 5) and enters on his office with two staves, "Favor" and "Union." He destroys "the three shepherds" in one month, but is soon weary of his flock and the flock of him. He breaks the staff "Favor," *i.e.*, the covenant of peace with the nations, and asks the traders for his hire. Receiving thirty pieces of silver, he casts it into the temple treasury and breaks the staff "Union," *i.e.*, the brotherhood between Judah and Israel. He is succeeded by a foolish shepherd, who neglects his flock and lets it go to ruin. At length Jehovah intervenes; the foolish shepherd falls by the sword; two-thirds of the people perish with him in the Messianic crisis, but the remnant of one-third forms the seed of the new theocracy (xi. 4–17 taken with xiii. 7–9, according to the necessary transposition proposed by Ewald). All this must be an allegory of past events, the time present to the author and his hopes for the future beginning only at xi. 17, xiii. 7–9. The general situation is clear: foreign kings govern Israel through native princes. The details cannot be explained in the absence of information as to the date and historical course of the events described by the prophet in allegorical form. But those who seek to escape this difficulty, by supposing that the word of the prophet was unintelligible to his contemporaries, and gained a true meaning only in its New Testament fulfilment,[2] must forget that in Zech. xi. 9 the shepherd wearies of his office and abandons the flock, while in the New Testament the shepherd gives his life for the sheep, and that in Zech. xi. 12, 13 the price is paid to the shepherd, but in the New Testament to the traitor.

Chap. xii. presents a third variation on the Messianic promise. All heathendom is gathered together against Jerusalem and perishes there. Jehovah first gives victory to the countryfolk of Judah and then they rescue the capital. After this triumph the noblest houses of Jerusalem hold, each by itself, a great lamentation over a martyr "whom they have pierced" (or "whom men have pierced"). In xii. 10 אֵלַי followed by עָלָיו cannot be right. If את be deleted, we may read אֲשֶׁר אֵלַי, but not אֵלָיו אֲשֶׁר, which is not Hebrew. Yet it is very doubtful if the deletion of את is justifiable or sufficient. It is taken for granted that the readers will know who the martyr is, and the exegesis of the church applies the passage to our Lord. Chap. xiii. 1–6 is a continuation of chap. xii.; the dawn of the day of salvation is accompanied by a general purging away of idolatry and the enthusiasm of false prophets. Yet a fourth variation of the picture of the incoming of the Messianic deliverance is given in chap. xiv. The heathen gather against Jerusalem and take the city, but do not utterly destroy the inhabitants. Then Jehovah, at a time known only to Himself, shall appear with all His saints on Mount Olivet and destroy the heathen in battle, while the men of Jerusalem take refuge in their terror in the great cleft that opens where Jehovah sets His foot. Now the new era begins, and even the heathen do homage to Jehovah by bringing due tribute to the annual feast of tabernacles. All in Jerusalem is holy down to the bells on the horses and the cooking-pots.

There is a striking contrast between chaps. i.–viii. and chaps. ix.–xiv. The former prophecy is closely tied to the situation and wants of the community of Jerusalem in the second year of Darius I., and all that it aims at arises out of the necessities of the time, and is of a practical and possible kind—the restoration of the temple and perhaps the elevation of Zerubbabel to the throne of David. The latter chapters, on the other hand, soar far above the field of reality; the historical situation from which they start can hardly be recognized; and the future hope has very little connection with the present. The fundamental difference between the two parts of the book lies, not in the subject but in the nature of the prophecy,—in the first part realistic and almost prosaic, in the second vague and fantastic. There are corresponding differences in style and speech; and it is particularly to be noted that, while the superscriptions in the first part name the author and give the date of each oracle with precision, those in the second part (ix. 1, xii. 1) are without name or date. That both parts do not belong to the same author must be admitted. But most recent critics make the second part the older. Chaps. ix.–xi. are ascribed to a contemporary of Amos and Hosea, about the middle of the 8th century B.C., because Ephraim is mentioned as well as Judah, and Assyria along with Egypt (x. 10), while the neighbors of Israel appear in ix. 1 *sq.* in the same way as in Amos i.–ii.

[1] See Wagenseil, *Sota*, p. 927; Lightfoot, on Matt. xxvi. 3.

[2] Matt. xxvii. 3–10; cp. *Jahrbb. f. D. Theol.*, 1873, p. 471 *sq.*

That chaps. xii.–xiv. are also pre-exilic is held to appear especially in the attack on idolatry and lying prophecy (xiii. 1–6); but, as this prophecy speaks only of Judah and Jerusalem, it is dated after the fall of Samaria, and is assigned to the last days of the Judæan kingdom on the strength of xii. 11, where an allusion is seen to the mourning for King Josiah, slain in battle at Megiddo. Some suppose that the author of ix.–xi. is the Zechariah, son of Jeberechiah, of Isa. viii. 2, and Bunsen ascribes xii.–xiv. to the prophet Urijah, son of Shemaiah (Jer. xxvi. 20 *sq.*). It is more likely that chaps. ix.–xiv. go all together and are of much later date.[1] These vague predictions have no real spiritual affinity either with the prophecy of Amos, Hosea, and Isaiah, or with that of Jeremiah, where we always feel the solid ground of present reality under our feet. It was only after the exile that prophecy lost its close connection with history and ceased to be built on present realities. The kind of eschatology which we find in Zech. ix.–xiv. was first introduced by Ezekiel, who in particular is the author of the conception that the time of deliverance is to be preceded by a joint attack of all nations on Jerusalem, in which they come to final overthrow (Ezek. xxxviii. *sq.*; Isa. lxvi. 18–24; Joel). The importance attached to the temple service, even in Messianic times (Zech. xiv.), implies an author who lived in the ideas of the religious commonwealth of post-exile times. A future king is hoped for; but in the present there is no Davidic king, only a Davidic family standing on the same level with other noble families in Jerusalem (xii. 7, 12). The "bastard" (mixed race) of Ashdod reminds us of Neh. xiii. 23 *sqq.*; and the words of ix. 12 ("to-day, also, do I declare that I will render double unto thee") have no sense unless they refer back to the deliverance from Babylonian exile. But the decisive argument is that in ix. 13 the sons of Javan, *i.e.*, the Greeks, appear as the representatives of the heathen world-power. The prophecy, therefore, is later than Alexander; and indeed the hostility to the Jews implied in the passage just cited dates only from the time when Palestine passed from the hands of the Ptolemies to those of the Seleucids. Assyria and Egypt (x. 11) may well be the Ptolemaic and Seleucid kingdoms, which together make up for the Jews the empire of the sons of Javan. In ix. 1 *sq.* (imitated from Amos i.–ii.) Seleucid Syria is described as parcelled out into a number of small principalities, some of which were at the time nearly independent. That the Jews had reason enough to hate their neighbors, even in later times, appears, *e.g.*, in 1 Mac. v.; compare especially ix. 6, 7 with 1 Mac. v. 68. The reference in ix. 8 would fit well with the Egyptian campaigns of Antiochus IV. Epiphanes, when Jerusalem suffered so much on the outward march and still more on the return of his troops. That the victory of Judah over the heathens is to precede the deliverance of Jerusalem (xii. 5 *sqq.*) is a remarkable feature, hardly to be explained except by the history of the Maccabee wars. The complaint about idolatry also fits this period; and that a new kind of prophecy then came up, in an age where it no longer had a legitimate place, is far from unlikely.

If this date is assumed for chaps. ix.–xiv., we must hold that, by the copious use of phrases from older prophets and other means, the author sought to give his oracles an archaic garb. That this is no unfair assumption appears especially in xiv. 5, in the reference to the earthquake in the days of Uzziah, which is natural only if the author addressed contemporaries of that catastrophe. This passage is indeed a stronger argument for a date in the Assyrian period than anything cited from chaps. ix.–xi. If, notwithstanding this, no commentator dates chap. xiv. less than 150 years after Uzziah, it is illegitimate to protest against the view that in chaps. ix. *sq.* Ephraim is an archaizing name for the Diaspora (1 Mac. v. 23, 45, 53).

How so late a piece was admitted among the prophetic writings, while Daniel, written about the same time, is placed only among the hagiographa, is a question not yet answered. We know too little about the history of the canon. A similar case is that of Isa. xxiv.–xxvii. But it is not less difficult to explain how a prophecy of the 8th century could have turned up in post-exile times and been appended to the book of Zechariah.

[1] [This lack of unity seems to have been noticed, and the authorship of the second part of Zechariah questioned for the first time by the learned Joseph Mede in 1664. Ewald, Bleek, and others are against the authorship; Such conservatives as Hengstenberg and Keil defend it, De Wette has varied in his opinion. The modern critical supposition is that by the error of a late compiler, those fragments which compose chaps. ix.–xiv. were joined to Zechariah.—AM. ED.]

The literature of the book is cited by C. H. H. Wright, *Zechariah and his Prophecies*, 2d ed., London, 1879. See also Stade, "Deuterozacharja," in *Zeitschr. f. AT. Wiss.*, 1881, p. 1 *sq.*; 1882, pp. 151 *sq.*, 275 *sq.* (J. WE.)

ZEITZ, an ancient manufacturing town in the extreme south of the province of Saxony, Prussia, is pleasantly situated on a hill on the White Elster, 22 miles south-southwest of Leipsic and 29 south-southeast of Halle. The river is here crossed by two iron bridges, and one stone and one timber bridge. The Gothic abbey church dates from the 15th century, but its Romanesque crypt from the 12th. The old Franciscan monastery, now occupied by a seminary, contains a library of 20,000 volumes. Just outside the town rises the Moritzburg, built in 1564 by the dukes of Saxe-Zeitz, on the site of the bishop's palace; it is now a reformatory and poorhouse. Zeitz has manufactures of cottons and woollens, machinery, wax-cloth, musical instruments, vinegar, cigars, etc.; and wood-carving, dyeing, and calico-printing are carried on. In the neighborhood there are considerable deposits of lignite, and mineral-oil works. In 1885 the population was 21,261 (18,265 in 1880); in 1816 it was 6640.

Zeitz is an ancient place of Slavonic origin. From 968 till 1028 it was the seat of a bishopric, afterwards removed to Naumburg, 15½ miles to the northwest, and styled Naumburg-Zeitz. In 1564 the last Roman Catholic bishop died, and his dominions were thenceforward administered by princes of Saxony. From 1653 till 1718 Zeitz was the capital of the dukes of Saxe-Zeitz or Sachsen-Zeitz. It thereafter remained in the possession of the electors of Saxony until 1815, when it passed to Prussia.

ZELLE, or more usually CELLE, an industrial and commercial town in the district of Lüneburg in Prussia, is situated on the left bank of the navigable Aller, near its junction with the Fuse and the Laehte, 23 miles to the northeast of Hanover. The town, with which three suburbs were incorporated in 1869, is well built. It is the legal and official centre of a "circle," and contains the usual tribunals and bureaux, besides several schools, benevolent institutions, and a prison. The library of the appeal court-house consists of 60,000 vols. The principal church contains a ducal burial vault, in which is buried Sophia Dorothea, first wife of the elector George of Hanover, afterwards George I. of England. The town-house dates from the 14th century. The most interesting building in Zelle is the former ducal castle, begun in 1485 in the Late Gothic style, but with extensive Renaissance additions of the close of the 17th century. Caroline Matilda, the divorced wife of Christian VII. of Denmark and sister of George III. of England, resided here from 1772 till her death in 1775; she is buried in the above-mentioned church, and a memorial tablet has been erected to her in the "French garden" outside the town. The industries of the place include the manufacture of woollen yarn, cigars, glue, printers' ink, philosophical instruments, stoves, bricks, etc.; and it carries on trade in wood, wool, honey, wax, cranberries, and other articles. Nursery-gardening flourishes in the fertile environs, where there are also a large paper-mill and a Government stud farm. The population in 1885 was 18,782, almost entirely Protestant.

Zelle received town-rights in 1292. From about 1369 it was the residence of the ducal family of Brunswick-Lüneburg-Zelle, which became extinct in 1705. In the 17th century Zelle was the most strongly-fortified town in Lüneburg. In 1757 it was besieged and partly laid in ashes by Richelieu. At the peace of Zelle (5th February, 1679) Sweden gave in her adhesion to the peace of Nimeguen. Zelle is the birthplace of Thaer (1752–1828), the eminent agriculturist, and of Ernst K. F. Schulze (1789–1817), the poet.

ZEND-AVESTA, the original document of the religion of ZOROASTER (*q.v.*), and still used by the PARSEES (*q.v.*) as their bible and prayer book. The name "Zend-Avesta" has been current in Europe since the time of Anquetil Duperron (*c.* 1771), but the Parsees themselves call it simply *Avesta*,—*Zend* (*i.e.*, "interpretation") being specially employed to denote the translation and exposition of a great part of the Avesta which exists in PAHLAVI (*q.v.*). Text and translation are often spoken of together in Pahlavi books as *Avistâk va Zand* ("Avesta and Zend"), whence (through a misunderstanding) our word Zend-Avesta. The origin and meaning of the word "Avesta" (or in its older form *Avistâk*) are alike obscure; it cannot be traced further back than the Sasanian period. The language of the Avesta is still frequently called Zend; but, as already implied, this is a mistake. We possess no other document written in it, and on this account modern Parsee scholars, as well as the older Pahlavi books, speak of the language and the writing indifferently as Avesta. As the original home of the language can only be very doubtfully conjectured, we shall do well to follow the usage sanctioned by old custom and apply the word to both. Although the Avesta is a work of but moderate compass (comparable, say, to the *Iliad* and *Odyssey* taken together), there nevertheless exists no single MS. which gives it in its entirety. This circumstance alone is enough to reveal the true nature of the book: it is a composite whole, a collection of writings as the Old Testament is. It consists, as we shall afterwards see, of the last remains of the extensive sacred literature in which the Zoroastrian faith was formerly set forth.

Contents and Character.—As we now have it, the Avesta consists of four parts.—the Yasna, the Vispered, the Vendidad, and the Khordah Avesta.

1. The *Yasna*, the principal liturgical book of the Parsees, in 72 chapters (*hâiti, hâ*), contains the texts that are read by the priest at the solemn Yasna (Izeshne) ceremony. The arrangement of the chapters is purely liturgical, although their matter in many cases has nothing to do with the liturgical action. The kernel of the whole book, around which the remaining portions are grouped, consists of the *Gâthâs* or "hymns" of ZOROASTER (*q.v.*), the oldest and most sacred portion of the entire canon. The Yasna accordingly falls into three sections of about equal length. (*a*) The introduction (chaps. 1–27) for the most part is made up of long-winded, monotonous, reiterated invocations. (*b*) The Gâthâs (chs. 28–54) contain the discourses, exhortations, and revelations of the prophet, written in a metrical style and an archaic language, different in many respects from that ordinarily used in the Avesta. As to the authenticity of these hymns, see ZOROASTER. The Gâthâs proper, arranged according to the metres in which they are written, fall into five subdivisions (28–37, 43–46, 47–50, 51, 53). Between chap. 37 and chap. 43 is inserted the so-called Seven-Chapter Yasna (*haptanghâiti*), a number of small prose pieces not far behind the Gâthâs in antiquity. (*c*) The so-called Later Yasna (*Aparô Yasnô*) (chaps. 54–72) has contents of considerable variety, but consists mainly of invocations.

2. The *Vispered*, a minor liturgical work in 24 chapters (*karde*), is alike in form and substance completely dependent on the Yasna; it is based upon the arrangement of the Yasna in its present form, a circumstance proving its much later date as a whole. The name Vispered meaning "all the chiefs" (*vispê ratarô*), has reference to the spiritual heads of the religion of Ormuzd, invocations to whom form the main contents of the book.

3. The *Vendidad* (*Vîdaêvô Dâtem*), *i.e.*, the law for the "enemies of the devil," contains in 22 chapters (*fargard*) a kind of dualistic account of creation (chap. 1), the legend of Yima and the golden age (chap. 2), the praises of agriculture (chap. 3), and in the bulk of the remaining chapters the circumstantial precepts of the religion with reference to purification and ecclesiastical penance. It may with propriety be called the "priestly code" of the Parsees.

The Yasna, Vispered, and Vendidad together constitute the Avesta in the stricter sense of that word, and the reading of them appertains to the priest alone. For liturgical purposes the separate chapters of the Vendidad and the Vispered are sometimes inserted amongst those of the Yasna so as to form what is known as the Vendidad Sâde, which then, accompanied by certain liturgical actions, is publicly read in the Parsee worship. The reading of the Gâthâs and Vendidad in this case may, when viewed according to the original intention, be taken as corresponding in some sense to the sermon, while that of the Vispered and the rest of the Yasna may be taken as corresponding to the hymns and prayers of Christian worship.

4. In marked contrast to the three already mentioned is the *Khordah Avesta*, or Little Avesta, which is designed equally for priesthood and laity, and serves rather as a book of private devotion. Besides some short prayers, such as the Nyâishes, the favorite daily prayers of the Parsees, it contains the Yashts or songs of praise, twenty-one in number, addressed to the Yazatas (Izads), the deities and angels of the Ormuzd creed.

Over and above the four books just enumerated there are a considerable number of fragments from other books, as well as quotations, glosses, and glossaries.

In its present form, however, the Avesta is only a fragmentary remnant of the old priestly literature of Zoroastrianism, a fact confessed by the learned tradition of the Parsees themselves, according to which the number of Yashts was originally thirty. The truth is that we possess but a trifling portion of a very much larger original Avesta, if we are to believe native tradition, carrying us back to the Sasanian period, which tells of an original Avesta in twenty-one books called *nasks* or *nosks*, as to the names, contents, and chapters of which we have several more or less detailed accounts, particularly in the Pahlavi Dînkard and in the Rivayats. From the same sources we learn that even then a considerable portion of the original Avesta had been lost: we are told that of a number of nosks only a small portion was found to be extant "after Alexander." For example, of the seventh nosk, which "before Alexander" had as many as fifty chapters, there then remained only thirteen; and similar things are alleged about the eighth, ninth, tenth, and other nosks. But even of the remains of the original Avesta, as these lay before the authors referred to, only a small portion has survived to our time. Of all the nosks one only, the nineteenth, has come down to us unimpaired and intact,—the Vendidad. All the others, with the exception of slight traces, have disappeared in the course of centuries.

It would be rash to treat in an off-hand way this old tradition about the twenty-one nosks as pure invention. The number twenty-one indeed points to an artificial arrangement of the material; for twenty-one is a sacred number, and the most sacred prayer of the Parsees, the so-called Ahunô Vairyô (Honovar) contains twenty-one words; and it is also true that in the enumeration of the nosks we miss the names of the books we know—Yasna, Vispered, as well as the Yashts and the Khordah Avesta. But either we must regard them as having been included among the nosks, though under other names, or, what is even more probable, we must assume that even at that early date special liturgical manuals—the Yasna especially—distinct from the nosks had already been compiled for the practical use of the priests. Further, the statements of the Dînkard and other writings leave on one a very distinct impression that the authors actually had before them the text of the nosks, or at all events of a large part of them. And, besides, in other directions there are numerous indications that such books had once really existed. In the Khordah Avesta as we now have it we find two Srôsh Yashts; with regard to the first, it is expressly stated in old MSS. that it was taken from the Hâdôkht nosk (the twentieth, according to the Dînkard). From the same nosk also a considerable

fragment (*Yt.*, 21 and 22 in Westergaard) has been taken. So also the extensive quotations from Avesta texts in the *Niringistân*, a Pahlavi book, are probably the disjecta membra of the seventeenth (or Hûspâram) nosk. Lastly, the numerous other fragments, the quotations in the Pahlavi translation, the many references in the *Bundahish* to passages of this Avesta not now known to us, all presuppose the existence in the Sasanian period of a much more extensive Avesta literature than the mere prayer book now in our hands. The existence of an original Avesta is far from being a mere myth. But, even granting that a certain obscurity still hangs undispelled over the problem of the old Avesta, with its twenty-one nosks, we may well believe the Parsees themselves, when they tell us that their sacred literature has passed through successive stages of decay, the last of which is represented by the present Avesta. There is evidence of this in the patchwork and fragmentary character of some portions of the present Avesta ; and, moreover, in the MS. evidence of recent centuries we are able to observe with our own eyes the actual process of abridgment gradually going on, and to trace the manner in which certain portions of the present Avesta slowly passed out of currency. This holds good, in particular, of the greater Yashts. The transcribers of the Khordah Avesta satisfied themselves for the most part with those prayers which were currently in use, such as the Nyâishes and one or two of the smaller and intermediate Yashts. The great Yashts are not of very frequent occurrence : some of them indeed are already met with but seldom, and MSS. containing all the Yashts are of great rarity. Of the fifteenth, seventeenth, and nineteenth Yashts we might even venture to predict that some centuries hence they may perhaps be found defying the tooth of time in not more than a single manuscript copy.

Origin and History.—While all that Herodotus (i. 132) has got to say is that the Magi sang "the theogony" at their sacrifices, Pausanias is able to add (v. 27, 3) that they read from a book. Hermippus in the 3d century B.C. affirmed that Zoroaster, the founder of the doctrine of the Magi, was the author of twenty books, each containing 100,000 verses. According to the Arab historian Tabari, these were written on 1200 cowhides, a statement confirmed by Masudi, who writes, "Zartusht gave to the Persians the book called Avesta. It consisted of twenty-one parts, each containing 200 leaves. This book, in the writing which Zartusht invented and which the Magi called the writing of religion, was written on 12,000 cowhides, bound together by golden bands. Its language was the Old Persian, which no one now understands." These statements sufficiently establish the existence and great bulk of the sacred writings. Parsee tradition adds a number of interesting statements as to their history. According to the *Arda-Viraf-Nâma*, stated to have been written during the Sasanian period, the religion revealed through Zoroaster had subsisted in its purity for 300 years when Iskander Rumi (Alexander the Great) invaded and devastated Iran, and burnt the Avesta which, written on cowhides with golden ink, was preserved in the archives at Persepolis. According to the Dînkard, there were two copies, of which one was burnt, while the second perished at the hands of the Greeks in some other way. The Rivayats have it that Alexander burnt the greater part of the twenty-one nosks, and go on to say that after his death the Zoroastrian priests met, gathered the scattered fragments which had escaped the ravages of war, and put together the present collection, which is but a small portion of the original book. With regard to this editing the Dînkard gives various details. It tells us that the collecting of the Avesta fragments, so far as these were still extant, whether in writing or in oral tradition, began under the last of the Arsacids at the command of King Vologeses. The first of the Sasanians, Ardeshîr Bâbagân, and his son Shapûr I. resumed and continued the work, and proclaimed the new Avesta thus produced as canonical. Finally, under Shapûr II. (309–380) a new revision and final redaction were made by Adarbâd Mahraspand.

It is possible enough for historical criticism to regard this tradition in many of its features as mere fiction, or as a perversion of facts made for the purpose of transferring the blame for the loss of a sacred literature to other shoulders than those really responsible for it. People may, if they choose, absolve Alexander from the charge of vandalism of which he is accused ; but the fact nevertheless remains, that he suffered the palace at Persepolis to be burnt (Diod., xvii. 72 ; Curt., v. 7). Even the statement as to the one or two complete copies of the Avesta may be given up as the invention of a later day. Nevertheless the essential elements of the tradition remain unshaken, viz., that the original Avesta or old sacred literature, divided on account of its great bulk and heterogencous contents into many portions and a variety of separate works, had an actual existence in numerous copies and also in the memories of priests, that, although gradually diminishing in bulk, it remained extant during the long period of foreign domination and ecclesiastical decay after the time of Alexander, and that it served as a basis for the redaction subsequently made. The kernel of this native tradition—the fact of a late collection of older fragments—appears indisputable. The character of the book is entirely that of a compilation.

In its outward form the Avesta as we now have it belongs to the Sasanian period, the last survival of the compilers' work already alluded to. And it need hardly be said that the collecting and arranging of the scattered fragments often rendered necessary, or at least desirable, certain additions by the redactors' own hands. But, broadly speaking, the materials out of which the compilers reared their building belonged originally to older structures and are of very various dates. Opinions differ greatly as to the precise age of the original texts brought together by subsequent redactors : according to some, they are pre-Achæmenian ; according to Darmesteter, they were written in Media under the Achæmenian dynasty ; according to Eduard Meyer, they are on the whole of Sasanian origin ; according to some, their source must be sought in the east, according to others, in the west, of Iran. But to search for a precise time or exact locality is to deal with the question too narrowly ; it is more correct to say that the Avesta was worked at from the time of Zoroaster down to the Sasanian period. Its oldest portions, the Gâthâs, proceed from Zoroaster himself. This conclusion is inevitable for everyone to whom Zoroaster is an historical personality, and who does not shun the labor of an unprejudiced research into the meaning of those difficult texts (comp. ZOROASTER). The rest of the Avesta, in spite of the opposite opinion of learned Parsees, does not even claim to come from Zoroaster. As the Gâthâs constitute the kernel of the Later Yasna, so they ultimately proved to be the first nucleus of a religious literature at large. The language in which Zoroaster taught, especially a later development of it,—an idiom indisputably belonging to eastern Iran,—remained as the standard with the followers of Zoroaster, and became the sacred language of the priesthood of the faith which he had founded ; as such it became, so to speak, absolved from the ordinary conditions of time and space. Taught and acquired as an ecclesiastical language, it was enabled to live an artificial life long after it had become extinct as a vernacular,—in this respect comparable to the Latin of the Middle Ages or the Hebrew of the rabbinical schools. The various texts themselves enable us to trace its gradual paralysis, decay, and death. It is only from this point of view that the language can be used as a criterion for the relative chronology of these. Any more exact arrangement seems almost impossible ; we

have practically no other tests to apply. The priests by whom the texts were edited gave them the form intended to be valid once for all and refrained from any allusion to ephemeral relations. The following conclusions may be stated in a general way.

The language of the Avesta travelled with the Zoroastrian religion and with the main body of the priesthood, in all probability, that is to say, from east to west; within the limits of Iran it became international. The Avesta texts must have passed through a long process of development, which did not reach its close till at a comparatively late period. Many portions are the result of repeated redacting and compiling; older texts are removed from their original connection, and worked into new ones or made use of in these. In these operations the revisers of the Sasanian epoch may be presumed to have had only the smallest share; the texts they had before them were already for the most part in a revised form. They were no longer in a position to give a relatively correct text; what they still had in their power to some extent to perform is approximately exhibited in such passages as *Yt.*, 1, 12 *sq.*; *Yt.*, 2, 11 *sq.*; *Yt.*, 10, 120 *sq.*,—perhaps in part translated back from the Pahlavi.

The great Yashts and the Vendidad are the most instructive portions for the history of the text. The original kernel of *Yashts* 5, 8, 15, 17, 19 consists of the Iranian mythology of gods and heroes which had its origin in the East, and there also was cast into a poetical form. Fragments of it were worked into the framework of the great Yashts at a much later date. The author of *Vend.*, 2 used in a fragmentary way a poetic version of the Yima legend. The redactor of *Vend.*, 3, judging from the monotonous and clumsy style of the opening sections, must have been prosaic enough; yet from the twenty-fourth paragraph onwards we have a bright and pleasant description of the blessings of agriculture, in a poetical form, that contrasts singularly with what immediately precedes it, and must certainly have been borrowed from an older source. In this way alone can we in other instances also account for the numerous verses with which the prose is often interspersed. Their function often was merely to set off and ornament the later prose. Of "genuine" and "spurious" there can be in this connection no question, but only of "older" and "more recent." However vague and obscure the question may remain after all has been said, we can at least lay so much down as fundamentally fixed, namely, that all that is metrical in the Avesta bears the stamp of a higher antiquity than does the prose.

As has been already stated, the Avesta now in our hands is but a small portion of the book as edited under the Sasanians. The large part perished under the devastating wave of persecution which broke over Iran with the Mohammedan invasion, or under the still more fatal influences of the apathy and forgetfulness of its proper guardians. The understanding of the older Avesta texts was far from perfect even at the time when they were being edited and revised. The need for a translation and interpretation became evident; and under the later Sasanians the majority of the books, if not the whole of them, were rendered into the current Pahlavi. A thorough use of this translation will not be possible until we have it in good critical editions, and acquaintance with its language ceases to be the monopoly of a few privileged individuals. For the interpretation of the older texts it is of great value. The Parsee priest Neryosangh subsequently translated a portion of the Pahlavi version into Sanskrit.

The MSS. of the Avesta are, comparatively speaking, of recent date. The oldest is the Pahlavi Vispered in Copenhagen, of date 1258. Next come the four MSS. of the Herbad Mihirâpân Kaî Khusro at Cambay (1323 and 1324), two Vendidads with Pahlavi in London and Copenhagen, and two Yasnas with Pahlavi in Copenhagen and Bombay, in the possession of Dastur Jamaspji Minocheherji, who of all the Parsees is richest in old and good MSS. Generally speaking, the MSS. fall off in quality and carefulness in proportion to their lateness; an honorable exception must be made in favor of those proceeding from Kirman and Yazd in Persia, mostly dating from the 17th and 18th centuries.

The first European scholar to direct attention to the Avesta was Hyde of Oxford, in his *Historia Religionis Veterum Persarum eorumque Magorum* (1700), which, however, failed to awaken any lasting interest in the sacred writings of the Parsees. The merit of achieving this belongs to the enthusiastic Orientalist Anquetil Duperron, the fruit of whose prolonged stay in India (from 1754 to 1761) and his acquaintance with the Parsee priests was a translation (certainly very defective) of the Zend-Avesta. The foundation of a scientific exegesis was laid by Burnouf. The interpretation of the Avesta is one of the most difficult problems of Oriental philology. To this very day no kind of agreement has been reached by conflicting schools even upon some of the most important points. The most salient contributions are those of Westergaard, Spiegel, Darmesteter, Roth, and Bartholomae. Opinion is divided also as to the significance of the Avesta in the literature of the world. The exaggerated enthusiasm of Anquetil Duperron has been followed, especially since Spiegel's translation, by an excessive reaction. The future will doubtless be more just with regard to the importance of the book for the history of religion in general and even of Christianity.

Editions.—The first complete editions were that by Westergaard (Copenhagen, 1852–54) and that of the Avesta in the stricter sense, along with the Pahlavi translation, by Spiegel (Vienna, 1853–58). A new and complete edition by Geldner has been in course of publication since 1885. The best translation is that by Darmesteter and Mills in *Sacred Books of the East* (3 vols., Oxford, 1880 *sq.*, with an excellent introduction by the first-named).

Literature.—See Anquetil Duperron, *Zend-Avesta, Ouvrage de Zoroastre*, etc. (Paris, 1771); Haug, *Essays on the Sacred Language*, etc., *of the Parsis*, especially in the new edition by E. W. West (London, 1878); De Harlez, *Introduction à l'Étude de l'Avesta* (Paris, 1881); Max Duneker, *Geschichte des Alterthums*, vol. iv.; and Eduard Meyer, *Geschichte des Alterthums* (Stuttgart, 1884).

(K. G.)

ZENO, emperor of the East from 474 to 491, was an Isaurian of noble birth, and originally bore the name of Trascalissæus, which he exchanged for that of Zeno on his marriage with Ariadne, daughter of Leo I., in 468. Of his early life nothing is known; after his marriage (which was designed by Leo to secure the Isaurian support against his ambitious minister Aspar) he became patrician and commander of the imperial guard and of the armies in the East. While on a campaign in Thrace he narrowly escaped assassination; and on his return to the capital he avenged himself by compassing the murder of Aspar, who had instigated the attempt. In 474 Leo. I. died after appointing as his successor Leo the son of Zeno and Ariadne; Zeno, however, with the help of his mother-in-law Verina, succeeded in getting himself crowned also, and on the death of his son before the end of the year became sole emperor. In the following year, in consequence of a revolt fomented by Verina in favor of her brother Basiliscus, he was compelled to take refuge in Isauria, whither he was pursued by Illus and Trocundus, two of the usurper's generals, and where, after sustaining a defeat, he was compelled to shut himself up in a strong castle. Basiliscus, however, soon outstripped Zeno in avarice, cruelty, and self-indulgence, and the vicissitudes of war and intrigue ultimately enabled the latter to re-enter Constantinople unopposed (July, 477), while his rival was banished to Phrygia, where he soon afterwards died. The remainder of Zeno's reign was disturbed by numerous other less formidable revolts, and it was to relieve himself of the pressure of one of these that in 487 he gave THEODORIC (*q.v.*) permission to invade Italy and dethrone Odoacer, which led to the establishment of the Ostrogothic kingdom in Italy. At an earlier period of his reign (476) Zeno had received the deputation from the Roman senate which announced the deposition of Romulus Augustulus. In ecclesiastical history the name of Zeno is associated with the *Henoticon* or instrument of union, promulgated by him and signed by all the Eastern bishops, with the design of terminating the Monophysite controversy. The document, which is given by Evagrius (*H.E.*, iii. 14), reaffirms the doctrine of the Nicæno-Constantinopolitan

creed, and renews the condemnation of Nestorius pronounced by the council of Ephesus, but adroitly avoids the crucial point as to the unity or duality of natures in the Incarnate Word, treating this as an open question.

ZENO OF CITIUM. See STOICS.

ZENO OF ELEA, son of Teleutagoras, is supposed to have been born towards the beginning of the 5th century B.C. The pupil and the friend of Parmenides, he sought to recommend his master's doctrine of the existence of the One by controverting the popular belief in the existence of the Many. In virtue of this method of indirect argumentation he is regarded as the inventor of "dialectic," that is to say, disputation having for its end not victory but the discovery or the transmission of truth. He is said to have been concerned in a plot against a tyrant, and on its detection to have borne with exemplary constancy the tortures to which he was subjected; but authorities differ both as to the name and the residence of the tyrant and as to the circumstances and the issue of the enterprise.

In Plato's *Parmenides*, Socrates, "then very young," meets Parmenides, "an old man some sixty-five years of age," and Zeno, "a man of about forty, tall and personable," and engages them in philosophical discussion. But it may be doubted whether such a meeting was chronologically possible. Plato's account of Zeno's teaching (*Parmenides*, 128 *sq.*) is, however, presumably as accurate as it is precise. In reply to those who thought that Parmenides's theory of the existence of the One involved inconsistencies and absurdities, Zeno tried to show that the assumption of the existence of the Many carried with it inconsistencies and absurdities grosser and more numerous. In early youth he collected his arguments in a book, which, according to Plato, was put into circulation without his knowledge.

Of the paradoxes used by Zeno to discredit the belief in plurality and motion, eight survive in the writings of Aristotle and Simplicius. They are commonly stated as follows:[1] (1) If the Existent is Many, it must be at once infinitely small and infinitely great—infinitely small, because the parts of which it consists must be indivisible and therefore without magnitude; infinitely great, because, that any part having magnitude may be separate from any other part, the intervention of a third part having magnitude is necessary, and that this third part may be separate from the other two the intervention of other parts having magnitude is necessary, and so on *ad infinitum*. (2) In like manner the Many must be numerically both finite and infinite—numerically finite, because there are as many things as there are, neither more nor less; numerically infinite, because, that any two things may be separate, the intervention of a third thing is necessary, and so on *ad infinitum*. (3) If all that is is in space, space itself must be in space, and so on *ad infinitum*. (4) If a bushel of corn turned out upon the floor makes a noise, each grain and each part of each grain must make a noise likewise; but, in fact, it is not so. (5) Before a body in motion can reach a given point, it must first traverse the half of the distance; before it can traverse the half of the distance, it must first traverse the quarter; and so on *ad infinitum*. Hence, that a body may pass from one point to another, it must traverse an infinite number of divisions. But an infinite distance (which Zeno fails to distinguish from a finite distance infinitely divided) cannot be traversed in a finite time. Consequently, the goal can never be reached. (6) If the tortoise has the start of Achilles, Achilles can never come up with the tortoise; for, while Achilles traverses the distance from his starting-point to the starting-point of the tortoise, the tortoise advances a certain distance, and while Achilles traverses this distance the tortoise makes a further advance, and so on *ad infinitum*. Consequently, Achilles may run *ad infinitum* without overtaking the tortoise. [This paradox is virtually identical with (5), the only difference being that, whereas in (5) there is one body, in (6) there are two bodies, moving towards a limit. The "infinity" of the premise is an infinity of subdivisions of a distance which is finite; the "infinity" of the conclusion is an infinity of distance. Thus Zeno again confounds a finite distance infinitely divided with an infinite distance. If the tortoise has a start of 1000 feet, Achilles, on the supposition that his speed is ten times that of the tortoise, must traverse an infinite number of spaces —1000 feet, 100 feet, 10 feet, etc.—and the tortoise must traverse an infinite number of spaces—100 feet, 10 feet, 1 foot, etc.—before they reach the point, distant from their starting-points 1111$\frac{1}{9}$ feet and 111$\frac{1}{9}$ feet respectively, at which the tortoise is overtaken. In a word, 1000, 100, 10, etc., in (6) and $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, etc., in (5) are convergent series, and 1111$\frac{1}{9}$ and 1 are the limits to which they respectively approximate.] (7) So long as anything is in one and the same space, it is at rest. Hence an arrow is at rest during every moment of its flight, and therefore also during the whole of its flight. (8) Two bodies moving with equal speed traverse equal spaces in equal times. But, when two bodies move with equal speed in opposite directions, the one passes the other in half the time in which it passes it when at rest. These propositions appeared to Zeno to be irreconcilable.

In short, the ordinary belief in plurality and motion seemed to him to involve fatal inconsistencies, whence he inferred that Parmenides was justified in distinguishing the mutable movable Many from the immutable immovable One, which alone is really existent. In other words, Zeno re-affirmed the dogma, "The Ent is, the Non-ent is not." It may seem strange that a reasoner so acute should confound that which is infinitely divisible with that which is infinitely great, as in (1), (2), (5), and (6); that he should identify space and magnitude, as in (3); that he should neglect the imperfection of the organs of sense, as in (4); that he should resolve motion into a series of states of rest, and on the strength of this analysis deny the reality of motion, as in (7); and that he should ignore the relativity of speed, as in (8). But Zeno's perplexity was genuine, and his end was positive. He was neither an eristic seeking an argumentative victory, nor a skeptic despairing of truth, but an honest thinker, breaking ground in a new field with indifferent success.

Great as was the importance of these paradoxes of plurality and motion in stimulating speculation about space and time, their direct influence upon Greek thought was less considerable than that of another paradox,—strangely neglected by historians of philosophy,—the paradox of predication. We learn from Plato (*Parmenides*, 127 D) that "the first hypothesis of the first argument" of Zeno's book above mentioned ran as follows: "If existences are many, they must be both like and unlike [unlike, inasmuch as they are not one and the same, and like, inasmuch as they agree in not being one and the same, Proclus, *On the Parmenides*, ii. 143]. But this is impossible; for unlike things cannot be like, nor like things unlike. Therefore existences are not many." That is to say, not perceiving that the same thing may be at once like and unlike in different relations, Zeno regarded the attribution to the same thing of likeness and unlikeness as a violation of what was afterwards known as the principle of contradiction; and, finding that plurality entailed these attributions, he inferred its unreality. Now, when without qualification he affirmed that the unlike thing cannot be like, nor the like thing unlike, he was on the high road to the doctrine maintained three-quarters of a century later by the Cynics, that no predication which is not identical is legitimate. He was not indeed aware how deeply he had committed himself; otherwise he would have observed that his argument, if valid against the Many of the vulgar, was valid also against the One of Parmenides, with its plurality of attributes, as well as that, in the absence of a theory of predication, it was useless to speculate about knowledge and being. But others were not slow to draw the obvious conclusions; and it may be conjectured that Gorgias's skeptical development of the Zenonian logic contributed, not less than Protagoras's skeptical development of the Ionian physics, to the diversion of the intellectual energies of Greece from the pursuit of truth to the pursuit of culture.

For three-quarters of a century, then, philosophy was at a standstill; and, when in the second decade of the 4th century the pursuit of truth was resumed, it was plain that the difficulty raised by Zeno must be met before the problems which had occupied the earlier thinkers—the problem of knowledge and the problem of being—could be so much as attempted.

[1] See Zeller, *Die Philosophie d. Griechen*, I. 540 *sq.*; *Grundriss*, 54.

Accordingly, in the seventh book of the *Republic*, where Plato propounds his scheme of Academic education, he directs the attention of studious youth primarily, if not exclusively, to the concurrence of inconsistent attributes; and in the *Phædo*, 102 B–103 A, taking as an instance the tallness and the shortness simultaneously discoverable in Simmias, he offers his own theory of the immanent idea as the solution of the paradox. Simmias, he says, has in him the ideas of tall and short. Again, when it presently appeared that the theory of the immanent idea was inconsistent with itself, and moreover inapplicable to explain predication except where the subject was a sensible thing, so that reconstruction became necessary, the Zenonian difficulty continued to demand and to receive Plato's best attention. Thus, in the *Parmenides*, with the paradox of likeness and unlikeness for his text, he inquires how far the current theories of being (his own included) are capable of providing, not only for knowledge, but also for predication, and in the concluding sentence he suggests that, as likeness and unlikeness, greatness and smallness, etc., are relations, the initial paradox is no longer paradoxical; while in the *Sophist*, Zeno's doctrine having been shown to be fatal to reason, thought, speech, and utterance, the principle which in the *Parmenides* is applied to *αὐτὰ καθ' αὑτὰ εἴδη* and to sensible particulars is extended to include the case of *εἴδη* which are not *αὐτὰ καθ' αὑτά*. It would seem then that, not to Antisthenes only, but to Plato also, Zeno's paradox of predication was a substantial difficulty; and we shall be disposed to give Zeno credit accordingly for his perception of its importance.

In all probability Zeno did not observe that in his controversial defence of Eleaticism he was interpreting Parmenides's teaching anew. But so it was. For, while Parmenides had recognized, together with the One, which is, and is the object of knowledge, a Many, which is not, and therefore is not known, but nevertheless becomes, and is the object of opinion, Zeno plainly affirmed that plurality, becoming, and opinion are one and all inconceivable. In a word, the fundamental dogma, "The Ent is, the Non-ent is not," which with Parmenides had been an assertion of the necessity of distinguishing between the Ent, which is, and the Non-ent, which is not, but becomes, was with Zeno a declaration of the Non-ent's absolute nullity. Thus, just as Empedocles developed Parmenides's theory of the Many to the neglect of his theory of the One, so Zeno developed the theory of the One to the neglect of the theory of the Many. With the severance of its two members Eleaticism proper, the Eleaticism of Parmenides, ceased to exist.

The first effect of Zeno's teaching was to complete the discomfiture of philosophy. For the paradox of predication, which he had used to disprove the existence of plurality, was virtually a denial of all speech and all thought, and thus led to a more comprehensive skepticism than that which sprang from the contemporary theories of sensation. Nevertheless, he left an enduring mark upon Greek speculation, inasmuch as he not only recognized the need of a logic, and grappled, however unsuccessfully, with one of the most obvious of logical problems, but also by the invention of dialectic provided a new and powerful instrument against the time when the One and the Many should be reunited in the philosophy of Plato.

Bibliography.—F. W. A. Mullach, *Fragmenta Philosophorum Græcorum*, Paris, 1860, i. 266 *sq.*; Zeller, *Die Philosophie d. Griechen*, Leipsic, 1876, i. 534–552; P. Tannery, *Pour l'Histoire de la Science Hellène*, Paris, 1887, pp. 247–261. Ignoring the philosophical aspect of Zeno's teaching, Tannery supposes him to have maintained in opposition to the Pythagoreans that body is not a sum of points, time not a sum of moments, and motion not a sum of passages from point to point. For histories of philosophy and other works upon Eleaticism, see PARMENIDES. (H. JA.)

ZENOBIA. See PALMYRA, vol. xviii. pp. 205–6 *sq.*

ZENTA, a market town of Hungary, in the county of Bács-Bodrog, on the right bank of the river Theiss, 20 miles south of Szegedin, is historically known for the decisive victory won in its vicinity by Prince Eugene over the Turks in 1696. The population, which is purely agricultural, numbered 21,200 in 1880, and 16,000 in 1886.

ZEPHANIAH (*Sophonias*, *Σοφονίας*, Heb. צְפַנְיָה, "whom Jehovah hides" or "protects"; compare the Phœnician man's or woman's name צפנבעל, *C.I.S.*, No. 207, Euting, *Pun. Steine*, p. 16), son of Cushi, the ninth, according to the order of his book, among the twelve minor prophets, flourished in the reign of Josiah of Judah, and apparently before the great reformation in the eighteenth year of that king (621 B.C.). For various forms of idolatry put down in that year are spoken of by Zephaniah as still prevalent in Judah (chap. i. 4 *sq.*), and are specified in such a connection as to imply that they were not the secret sins of individuals, but held the first place among the national backslidings that could, as the prophet teaches, be removed only by a sweeping judgment on the state. Of the person of Zephaniah nothing is known; but it has been conjectured that his great-great-grandfather Hezekiah (chap. i. 1) is the king of that name, and if so he belonged to the highest class of Judæan society.

The genuineness and integrity of the short prophecy ascribed to Zephaniah do not seem to be open to reasonable doubt. Stade (*Gesch. Isr.*, i. 644) raises a question about chap. iii., and if this were a distinct oracle there would be no cogent reason to ascribe it to the author of the two chapters that precede; for the book of the minor prophets is made up of a number of short pieces, some bearing a name and some anonymous, and it is only old usage that ascribes the anonymous pieces to the last preceding prophet whose name is prefixed to his prophecy. But, though the sequence of thought in the book of Zephaniah is not so smooth as a Western reader may desire, a single leading motive runs through the whole, and the first two chapters would be incomplete without the third, which, moreover, is certainly pre-exilic (verses 1–4), and presents specific points of contact with what precedes as well as a general agreement in style and idea.

The dominating motive of the whole is the approach of a sweeping and world-wide judgment, which the prophet announces as near at hand, and interprets, on the lines laid down by Isaiah in his prophecies about Israel and Assyria, as designed to destroy the wicked and prepare the way for the visible sovereignty of the righteous God of Israel. As regards Judah, which forms the subject of the first and third chapters, the effect of the judgment will be to sift out the idolaters, the men of violence and wrong, the false prophets and profane priests, the hardened men of the world to whom all religion is alike and who deem that the Lord will do neither good nor evil. The men who seek meekness and righteousness will be left, a poor and lowly people, trusting in the name of the Lord and eschewing falsehood. To them a future of gladness is reserved, a peaceful life under Jehovah's immediate kingship and loving protection. Such an ideal necessarily implies that they shall no longer be threatened by hostility from without, and this condition is satisfied by the prophet's view of the effect of the impending judgment on the ancient enemies of his nation. The destruction of the Philistines on the west and of Moab and Ammon on the east will enable the Hebrews to extend their settlements from the Mediterranean to the Syrian desert; and their remoter oppressors, the Ethiopians and Assyrians, shall also perish. That Ethiopia appears instead of Egypt is in accordance with the conditions of the time. It was with Ethiopic dynasts holding sway in Egypt that Assyria had to contend during the 7th century B.C., when the petty kingdoms of Palestine were so often crushed between the collision of the two great powers, and even Psammetichus, the contemporary of Josiah, and the restorer of a truly Egyptian kingdom, was nominally the heir of the great Ethiopian sovereigns.

These conceptions are closely modelled on the scheme of Jehovah's righteous purpose worked out by Isaiah a century before, when Judah first felt the weight of the Assyrian rod, and they afford the most conclusive evidence of the depth and permanence of that great prophet's influence. But in one point there is an important divergence. In Isaiah's view Assyria is the rod of God's anger; and, when the work of judgment is complete and Jehovah returns to the remnant of His people, the theodicea is completed by the fall of the unconscious instrument of the divine decrees before the inviolable walls of the holy mountain. Zephaniah in like manner looks to an all-conquering nation as the instrument of divine judgment on Judah and the rest of the known world. He represents the day of Jehovah, according to the old meaning of that phrase, as a day of battle (not an assize day); he speaks of the guests invited to Jehovah's sacrifice, *i.e.*, to a great slaughter, of alarm against fenced cities, of blood poured out as dust, of pillage and desolation at the hand of an enemy. But beyond this all is vague; we neither hear who the sword of Jehovah (ii. 12) is, nor what is to become of him when his work is completed. Isaiah's construction has in all its parts a definite reference to present political facts, and is worked out to a complete conclusion; Zephaniah borrows the ideas of his predecessor without attaining to his clearness of political conception, and so his picture is incomplete. The foreign conqueror, by whom Judah is to be chastised and Nineveh and Ethiopia destroyed, is brought on to the stage, but never taken off it. It is safe to conclude that the principal actor in the prophetic drama, who is thus strangely forgotten at the last, was not as real and prominent a figure in Zephaniah's political horizon as Assyria was in the horizon of Isaiah. At the same time it is reasonable to think that so complete a reproduction of Isaiah's ideas in the picture of a new world-judgment was not formed without some stimulus from without, and this stimulus has been sought in the Scythian invasion of western Asia, to which some of Jeremiah's earlier prophecies also appear to refer; see ISRAEL, vol. xiii. p. 425. But from the analysis given in the article SCYTHIA (vol. xxi. p. 604) it is doubtful whether the Scythians had appeared even on the distant horizon at the date of Zephaniah's prophecy,[1] while, on the other hand, the movements in the far East which preceded the first siege of Nineveh are chronologically suitable, and appear to afford quite sufficient basis for Zephaniah's undefined anticipation of a general political convulsion. How the danger that threatened Nineveh stirred the mind of the Hebrews appears also from the prophecy of Nahum.

Be this as it may, the comparison between Isaiah and Zephaniah affords an instructive example of the difference between original and reproductive prophecy. All the prophets have certain fundamental ideas in common, and each has learned something from his predecessors. If Zephaniah draws from Isaiah, Isaiah himself drew from Amos and Hosea. But Isaiah goes to his predecessors for general principles, and shapes the application of these principles to the conditions of his own time in a manner altogether fresh and independent. Zephaniah, on the other hand, goes to his predecessor for details; he does not clearly distinguish between the form and the substance of the prophetic ideas, and looks for a final consummation of the divine purpose, not only in accordance with the principles of Isaiah, but on the very lines which that prophet had laid down. But these lines were drawn on the assumption that the Assyrian judgment was final and would be directly followed by the reign of righteousness. This assumption was not justified by the event; the deliverance and reformation were incomplete; and the inbringing of the reign of righteousness was again deferred. Zephaniah sees this, but fails to draw the true inference. He postulates a new crisis in history similar to the Assyrian crisis of which Isaiah wrote, and assumes that it will run such a course as to fulfil Isaiah's unfulfilled predictions. But the movements of history do not repeat themselves; and the workings of God's righteous providence take fresh shape in each new scene of the world's life, so that a prediction not fulfilled under the conditions for which it was given can never again be fulfilled in detail. As it is an essential feature of prophecy that all ideas are not only presented but thought out in concrete form, and with reference to present historical conditions, the distinction between the temporary form and the permanent religious truth embodied in that form is also essential. The tendency to confound the two, to ascribe absolute truth to what is mere embodiment, and therefore to regard unfulfilled predictions as simply deferred, even where the form of the prediction is obviously dependent on mere temporary conditions of the prophet's own time, gained ground from the time of Zephaniah onwards, and culminated in the Apocalyptic literature. As it grew the eternal ideas of the great prophets fell into the background, and were at length entirely lost in the crass Jewish conception of a Messianic age, which is little more than an apotheosis of national particularism and self-righteousness. Zephaniah's eschatology is not open to this charge: with him, as with Isaiah, the doctrine of the salvation of the remnant of Israel is inspired by spiritual convictions and instinct with ethical force. The emphasis still lies on the moral idea of the remnant, not on the physical conception Israel. He does not yield to Amos or Isaiah in the courage with which he denounces sin in high places, and he is akin to Hosea in his firm hold of the principle that the divine governance is rooted not only in righteousness but in love, and that the triumph of love is the end of Jehovah's working. Yet even here we see the difference between the first and second generations of prophecy. The persuasion to which Hosea attains only through an intense inward struggle, which lends a peculiar pathos to his book, appears in Zephaniah, as it were, ready made. There is no mental conflict before he can pass through the anticipation of devastating judgment to the assurance of the victory of divine love, and the sharp transitions that characterize the book are not, as with Hosea, due to sudden revulsion of feeling, but only mark the passage to some new topic in the circle of received prophetic truth. The finest thing in the book—in spite of certain obscurities, which may be partly due to corruptions of the text—is the closing passage; but the description of the day of Jehovah, the *dies iræ dies illa* of Chap. i. 15, which furnishes the text of the most striking of mediæval hymns, has perhaps taken firmer hold of the religious imagination. Least satisfactory is the treatment of the judgment on heathen nations, and of their subsequent conversion to Jehovah. In the scheme of Isaiah it is made clear that the fall of the power that shatters the nations cannot fail to be recognized as Jehovah's work, for Assyria falls *before Jerusalem* as soon as it seeks to go beyond the limits of the divine commission, and thus the doctrine "With *us* is God" is openly vindicated before the nations. But Zephaniah assumes that the convulsions of history are Jehovah's work, and specially designed for the instruction and amendment of Israel (iii. 6 *sq.*), and neglects to show how this conviction, which he himself derives from Isaiah, is to be brought home by the coming judgment to the heart of heathen nations. Their own gods indeed will prove helpless (ii. 11), but this is not enough to turn their eyes towards Jehovah. Here, therefore, there is in his eschatology a sensible lacuna, from which Isaiah's construction is free, and a commencement of the tendency to look at things from a merely Israelite standpoint, which is so notable a feature of the later Apocalyptic.

There is no important separate commentary on Zephaniah; the student must refer to the commentaries on the minor prophets (see HOSEA). The relative section in Duhm, *Theologie der Propheten*, deserves attention. An apocryphal prophecy ascribed to Zephaniah is quoted by Clement of Alexandria, *Stromata*, v. 11, § 78. (W. R. S.)

ZEPHYRINUS, ST., bishop of Rome from about 202 to 26th August, 217, succeeded Victor I. He is described as a man of little intelligence or strength of character, and the somewhat important controversies on doctrine and discipline that marked his pontificate are more appropriately associated with the name of HIPPOLYTUS (*q.v.*) and of Calixtus, his principal adviser and afterwards his successor (see POPEDOM, vol. xix. p. 504).

ZEPHYRUS, the west wind, brother of Boreas, the north wind, was the son of the Titan Astræus and Eos, the dawn (Hes., *Theog.*, 579), and had his palace in Thrace (*Il.*, ix. 5; *Od.*, v. 295). He was married to Chloris, the goddess of flowers (Ov., *Fast.*, v. 195), by whom he had a son, Carpus; by the harpy

[1] The Scythians appeared in Media about 619 B.C., and, if they were really Sacæ and came from the East, their appearance in Palestine would fall still later.

Podarge he was also the father of Xanthus and Balius, the horses of Achilles (*Il.*, xvi. 150).

ZERAFSHAN, an independent "circle" or province of Russian Turkestan, includes the valley of the river Zerafshan from its sources to Katty-Kurgan, as well as the mountains which bound the valley to the north and south. It is the SOGDIANA (*q.v.*) of the ancients, famed for its fertility, which is due to the waters of the Polytimetus. The present Russian province of Zerafshan, which is densely peopled along the course of the river, has a length of nearly 250 miles from west to east, a width of from 50 to 100 miles, and an area of 19,665 square miles. It is bounded on the W. by Bokhara, on the N. by the Kizilkum Desert of Syr-Daria and the Russian province of Ferghana, on the E. by the Alai plateau, and on the S. by the vassal khanates of Bokhara,—Karategin, Hissar, Shah-i-Syabs, and Karshi. High chains of mountains enclose the province on three sides. To the north are the Turkestan Mountains, which separate the tributaries of the Syr from those of the Amu, rising to 22,000 feet in their highest snow-clad peaks, and crossed by but few passes, which themselves range from 10,000 to 13,000 feet. In the west the Turkestan Mountains are joined by the Nuratau Mountains, which have a north-westerly direction (see TURKESTAN). In the south-east the valley of the Zerafshan is separated from that of the Surkhab by the grand snow clad Hissar Range, which runs from northeast to southwest, and by several chains parallel to it, while further west a series of mountains, partly running also towards the south-west and partly towards the northwest, separate it from the Bokhara plains of the Amu. The lowest passes across these chains have altitudes of not less than 7000 feet. But the valley of the Zerafshan lies broadly open towards the steppes in the west, and has supplied an easy route for the railway from the Caspian by Merv to Samarkand.

Granites and all kinds of crystalline slates are widely developed in the mountains which enclose Zerafshan. Carboniferous limestones are met with in the west; but the great bulk of the deposits which overlie the crystalline slates, and are raised to the greatest heights in the highlands, belong to a more recent geological time, namely to the Secondary—chiefly chalk—and Tertiary periods. The Zerafshan valley owes its fertility to the thick terraces of loess which surround the base of the mountains and sometimes reach a thickness of 100 feet.

The Zerafshan river, which owes its name ("gold-spreading") probably more to the fertility it brings than to the gold which is found in very small quantities in its sands, rises under the name of Matchi from a large glacier, fed by the high peaks which rise at the junction (improperly called Kok-su) of the Turkestan Mountains with the Alai Range. The altitude of the glacier is about 9000 feet, and thence the Zerafshan flows due west in a narrow valley, with a fall of not less than 40 feet per mile. Several villages are scattered over the slopes of the mountains; and some thirty bridges, made of poplar trees felled across the river and swaying under the weight of the foot passenger, furnish means of communication. After a course of nearly 100 miles in the mountains the Zerafshan receives from the left the Fan, with the Yagnob, which flows in a high longitudinal valley, separated from the main river by the lofty Zerafshan Range. About Pendjakent it enters on its middle course along a broad valley from 20 to 50 miles wide. Large *aryks*, or irrigation canals, one of which is 50 miles in length and has all the appearance of a river, distribute the waters of the Zerafshan over the valley, while the river itself divides into two great branches, 10 to 12 miles apart, forming a large island, the Miankal, which is the most fertile part of the province. A dam keeps up the water in the southern branch, Kara-Daria, close by which is situated SAMARKAND (*q.v.*), and five large *aryks* distribute its water over the fields. Numberless canals drain off its waters farther west in the neighborhood of the city of Bokhara, so that, after carrying an insignificant volume of water to the small Lake Kara-kul, it stops its course there, some 30 miles from the Amu-Daria, of which it formerly was an affluent.

The population of Zerafshan was reckoned at 351,900 in 1883. The bulk of the inhabitants are Uzbegs and Tajiks, the remainder consisting of a few thousand Persians, Hindus, and Jews respectively; the Russians are mainly military, civil functionaries, merchants and a few peasant settlers. Wheat, barley, rice, and other cereals, as also lucerne, are widely cultivated, and the gardens of Zerafshan are beautiful. A variety of petty trades are carried on in the towns and villages.

Zerafshan is divided into three districts, the chief towns of which are Samarkand (36,000 inhabitants), now connected by rail with Bokhara, Merv, and Mikhailovsk on Krasnovodsk Bay in the Caspian Sea; Katty-Kurgan (4425), close by the frontier of Bokhara; and Pendjakent (1880), chief town of the mountain district of the upper Zerafshan, known as Kohistan.

ZERBST, a manufacturing town in the duchy of Anhalt, Germany, is situated on the Nuthe, 11 miles northwest of Dessau and 21 southeast of Magdeburg. It contains five churches, one of which (St. Nicholas), built in 1446–88, is a good example of the Late Gothic style as developed in Saxony, with its spacious proportions, groined vaulting, and bare simple pillars. The town-house dates from about 1480, but it was disfigured by additions in the beginning of the 17th century. The palace (1681–1750) has been used as a depository of archives since 1872. There are several quaint old houses, with high gables, in the market-place, in the middle of which stand a Roland column, of about 1445, and a bronze figure known as the "Butterjungfer" (butter-girl), of uncertain origin and meaning, but now regarded as the palladium of the town. The old Franciscan monastery, with fine cloisters, founded in 1250, contains the gymnasium; a nunnery of 1214 has been converted into barracks; and the Augustinian monastery of 1390 has been a hospital since 1525. The site of the old fortifications is occupied by pretty promenades. Gold and silver articles, silk, plush, cloth, leather, soap, starch, chemicals, and carriages are among the chief manufactures. Iron-founding is carried on; and several breweries are engaged in the preparation of Zerbster bitter beer, which enjoys considerable repute. Market-gardening is also a profitable industry at Zerbst. The population, almost entirely Protestant, was 15,069 in 1885; in 1849 it was 9350.

Zerbst is an ancient town, mentioned in 949. In 1307 it came into the possession of the Anhalt family, and from 1603 till 1793 was the capital of the collateral branch of Anhalt-Zerbst. In 1793 it passed to Anhalt-Dessau.

ZEUS, the chief deity of ancient Greek religion, bears a name which almost certainly means "sky." His title is identified by etymologists with the Sanskrit *Dyaus*, the "bright one," "sky," though his legend and place in religion are not closely akin to those of the Vedic deity. It seems nearly certain that the peoples who speak Aryan languages had at some remote time a common word for the sky, and nothing can be more probable than that they also worshipped the vault of heaven. In what sense the sky may have been an Aryan deity before the distant and obscure process called the Aryan dispersion, it is not possible with certainty to say. The followers of Mr. Herbert Spencer might not inconsistently suppose that there was once an Aryan medicine-man or chief named Sky, and that on his death his ghost was worshipped and his cult finally blended with that of the actual natural phenomenon. Or, again, it might be argued that the sky was originally adored as a symbol of the Infinite, and that men, losing the original conception, and misled by the personal appearance of the name as other words for sky became more familiar, were deceived into the belief that "sky" was a personal deity. Or, once more, theorists might urge that Sky was first worshipped at a stage of early fancy, when all things in nature were looked on as personal and of human parts and passions, while later the sky sank back into the category of lifeless things, leaving Zeus as a distinct personal being and deity. Other hypotheses might, no doubt, be invented, but unhappily we have no means of proving their historical accuracy. It is a common thing among backward races, for example on the Gold Coast, to find Sky worshipped as a god, or regarded as the dwelling-place of gods. How and in what manner

such conceptions were attained by the ancestors of the ancient Greeks we can never know as a matter of fact.

Coming to historical and documentary evidence, our earliest knowledge of Zeus is derived from the Homeric and Hesiodic poems. It is very probable that in the legend and ritual of remote towns and temples in Greece we have traces of a conception of Zeus much older than that which meets us in Homer. But Homer and Hesiod are the most ancient literary testimonies; next to these come the speculations of the early philosophers and the writings of the lyric poets, Pindar, Herodotus, and the tragedians. Finally, we have the Zeus of the philosophers of the central period,—Plato and Aristotle,—and the Zeus of the later philosophic periods down to the prevalence of Christianity.

By the time that Zeus meets us in Homer he has wandered far from the original conception of him. Whatever that may have been, Zeus cannot have been first imagined in an age of advanced society on the heroic system, that is, in an age of the fully developed monogamous family of city states each governed by a king, and of a general loose confederation, with a kind of upper and lower house,—the prince's council and the assembly of the people. It is, however, on the model of such a society that the Olympian consistory is organized in Homer, with Zeus for the bretwalda, the principal chief of the gods. Such a position Zeus holds in Homer. The poet represents him as anthropomorphic,—a powerful, humorous, amorous ruler, sometimes troubled by disputes among his younger brethren,—Hades and Poseidon,—his wife, and his children. His claim to supreme authority is based on primogeniture (*Il.*, xv. 187), whereas in Hesiod Zeus is the successful youngest son of Cronus. Both poets agree that he has overthrown the paternal dynasty, and established his own power after violent struggles. The legends in Hesiod are full of ugly and puerile fables and conceits, dating doubtless from remote and uncivilized antiquity. Though Zeus be so much of a magnified man in Homer, there are probably traces of the elemental conception, and his union with Hera (*Il.*, xiv. 152) on the crest of Ida may be a poetic memory of the old story of Heaven wedding Earth, though Hera cannot as a rule be regarded as a form of Gæa or of Demeter. While among the gods Zeus is a father, brother, and emperor, Homeric men sometimes use his name as we might use that of God, in a religious rather than in a mythological sense. Now regarded as subject to Fate, so that he cannot save even his own children from her decree, elsewhere he seems to hold the gifts of Fate in his own hand; from two vast jars he deals out good and evil to mankind. Where morals are concerned, he sanctions the oath (*Il.*, iii. 227) both in this world and the next, and he is the friend of strangers and suppliants, the patron of the hospitable hearth. In Homer Zeus does not assume the form of the lower animals, and in the strange passage where he recounts his loves, the Leporello of his own Don Juan, he says nothing of those well-known disguises. In Hesiod the old wild tales revive, and we learn, for example (*Theog.*, 886; compare the scholiast), that Zeus swallowed his own wife, Metis, after inducing her to take the shape of a fly, just as Puss-in-Boots got rid of the ogre who turned himself into a mouse. In Hesiod, too, we have the tale of Prometheus and Pandora, a tale which afforded such an admirable theme for moral handling by Æschylus. Zeus tempted Epimetheus by the aid of the woman Pandora; hence came death into the world and all our woe. Then Prometheus pitied and aided men, whom Zeus had intended to destroy, and the hero was fixed to a rock in Caucasus by order of the god. The myth may be allegorized in a dozen ways, and perhaps may be taken to mean that man does not increase happiness by increasing knowledge, science, and the arts of life. Without the gifts of Prometheus, carried to what Horace would have thought a profane pitch of perfection, we should not have reached modern industrialism and the horrors of modern war. In Hesiod Prometheus may stand for humanity vainly struggling to be powerful and happy against that inflexible and ruthless law which is Zeus. And what shall the end be? How shall the ways of Zeus be justified to men, and man's rebellion be justified to Zeus? We no more know how Æschylus solved the problem mythically than we can discover the actual solution. The idea that another shall voluntarily take the place of Prometheus (Æsch., *Prom. Vinct.*, 1026) naturally recalls the theory of the Atonement. To such mysteries does the Greek mind attain, and in such ultimate perplexities is the conception of Zeus, the *Bon Dieu* of the Homeric Olympian festivals, involved.

At the opposite pole from the Hesiodic Zeus is the Zeus who practically means the unknown god, as Terpander sings,

Ζεῦ πάντων ἀρχά, πάντων ἀγήτωρ,

or, as the Orphic hymn (whatever its date) proclaims him,

Ζεὺς κεφαλή, Ζεὺς μέσσα, Διὸς δ' ἐκ πάντα τέτυκται.

Thus Zeus becomes a shorthand symbol for the pantheistic deity.

The Zeus of pure religion and of speculation is very different from the Zeus of ritual and of local myth. To ritual, and to the local myths treasured by priests, which often tried to explain the ritual, we owe the unbecoming anecdotes of Zeus as the god who, in the form of ant, snake, bull, eagle, and so forth, made love to the daughters of men. On this point reference may be made to the work of the present writer, *Myths, Ritual, and Religion* (ii. 189). The hypothesis there offered is that the Greeks in their early uncivilized state, dwelling in tribes and in scattered kraals or villages, retained traditions like the totemic and magical beliefs of Red Indians or Australians. When they became more united and more civilized, they did not drop wholly the faith that they were descended from animals, nor wholly forget such tales as the Indians tell of Manibozho and the Australians of Punjel, but they transferred the old anecdotes to Zeus. In place of saying, "We descend from a bull," they said, "We descend from Zeus, who for purposes of amorous disguise took the shape of a bull," or a swan, or an ant, as the case might be. Probably some foreign legends, Phœnician or African, were also borrowed and attached to Zeus. If this be a correct, as it seems a possible, hypothesis, then it will be well to be cautious in explaining the myths about Zeus as if they were all of elementary origin, and all expressed in images some natural process or series of natural phenomena. We must regard Zeus as an extremely difficult complex, in which elemental myths, myths of savage fancy, myths of perverted history, theories of early natural philosophy, and the ideas of pantheistic speculation are all confusedly mingled. He is the sum of the religious thought of Hellas, formed in the numberless ages between savagery and complete civilization. He received human sacrifices even after the Christian era; yet long before it he all but corresponded to the Unknown Substance of Spencerian philosophy. (See Plato, *Rep.*, viii. 565 D; Suidas, *s.v.* "Laphystius.") A summary of the Zeus myths will be found in Dr. William Smith's *Dictionary of Classical Mythology*. For a comparison between the character and attributes of Jupiter and Zeus, see the article JUPITER.

Among modern works in which the character and legend of Zeus are discussed may be recommended Welcker's *Griechische Götterlehre* (Göttingen, 1857); Preller's *Griechische Mythologie* (Berlin, 1872); the *Selected Essays* of Mr. Max Müller; *Le Sentiment Religieux en Grèce* of M. Jules Girard (3d ed., Paris, 1887); and C. O. Müller's *Introduction to a Scientific System of Mythology* (Eng. transl., London, 1844). The subject has not yet been reached (1888) in Roscher's great *Lexikon*. The authorities named will introduce the reader in turn to other authors, their researches and speculations. Heyne's *Apollodorus* (Göttingen, 1803) is also useful.

(A. L.)

ZEUXIS, a Greek painter, who flourished about 420–390 B.C., and described himself as a native of Heraclea, meaning probably the town in Magna Græcia. To this neighborhood seem to point the facts of his having painted a figure of Helena for a temple in Croton, of his presenting a picture of Alcmena to the people of Agrigentum, and of his having been, in one account, a pupil of Damophilus of Himera in Sicily, the other statement being that he was a pupil of Neseus of Thasos. Afterwards he appears to have resided in Ephesus. His known works are—

1. Zeus Surrounded by Deities.
2. Eros Crowned with Roses.
3. Marsyas Bound.
4. Pan.
5. Centaur Family.
6. Boreas or Triton.
7. Infant Hercules Strangling the Serpents in Presence of his Parents, Alcmena and Amphitryon.
8. Alcmena, possibly another name for 7.
9. Helena at Croton.
10. Penelope.
11. Menelaus.
12. Athlete.
13. An Old Woman.
14. Boy with Grapes.
15. Grapes.
16. Monochromes.
17. Plastic works in clay.

In ancient records we are told that Zeuxis, following the initiative of Apollodorus, had introduced into the art of painting a method of representing his figures in light and shadow, as opposed to the older method of outline, with large flat masses of color for draperies, and other details, such as had been practiced by Polygnotus and others of the great fresco painters. The new method led to smaller compositions, and often to pictures consisting of only a single figure, on which it was the more easy for the painter to demonstrate the combined effect of the various means by which he obtained perfect roundness of form. The effect would appear strongly realistic, as compared with the older method, and to this was probably due the origin of such stories as the contest in which Zeuxis painted a bunch of grapes so like reality that birds flew towards it, while Parrhasius painted a curtain which even Zeuxis mistook for real. The story reads in Pliny (*N. H.*, xxxv. 65) as if Parrhasius had brought forward a picture with an apparent curtain hung in front to protect the colors from the light, and that Zeuxis had tried to pull the curtain aside. It is perhaps a variation of this story when we are told (Pliny, *loc. cit.*) that Zeuxis also painted a boy holding grapes, towards which birds flew, the artist remarking that if the boy had been as well painted as the grapes the birds would have kept at a distance. But, if the method of Zeuxis led him to real roundness of form, to natural coloring, and to pictures consisting of single figures or nearly so, it was likely to lead him also to search for striking attitudes or motives, which by the obviousness of their meaning should emulate the plain intelligibility of the larger compositions of older times. Lucian, in his *Zeuxis*, speaks of him as carrying this search to a novel and strange degree, as illustrated in the group of a Female Centaur with her Young. When the picture was exhibited, the spectators admired its invention and overlooked the skill of the painter, to the vexation of Zeuxis. The pictures of Hercules Strangling the Serpents to the astonishment of his father and mother (7), Penelope (10), and Menelaus Weeping (11) are quoted as instances in which strong motives naturally presented themselves to him. But, in spite of the tendency towards realism inherent in the new method of Zeuxis, he is said to have retained the largeness of form which had characterized his predecessors. Of all his known works it would be expected that this quality would have appeared best in his famous picture of Helena, for this reason, that we cannot conceive any striking or effective incident for him in her career. In addition to this, however, Quintilian states (*Inst. Orat.*, xii. 10, 4) that in respect of largeness of form Zeuxis had followed Homer, while there is the fact that he had inscribed two verses of the *Iliad* (iii. 156 *sq.*) under his figure of Helena. As models for the picture he was allowed the presence of five of the most beautiful maidens of Croton at his own request, in order that he might be able to "transfer the truth of life to a mute image." Cicero (*De Invent.*, ii. 1, 1) assumed that Zeuxis had found distributed among these five the various elements that went to make up a figure of ideal beauty. It should not, however, be understood that the painter had made up his figure by the process of combining the good points of various models, but rather that he found among those models the points that answered to the ideal Helena in his own mind, and that he merely required the models to guide and correct himself by during the process of transferring his ideal to form and color. This picture also is said to have been exhibited publicly, with the result that Zeuxis made much profit out of it. By this and other means, we are told, he became so rich as to rather give away his pictures than to sell them. He presented his Alcmena to the Agrigentines, his Pan to King Archelaus of Macedonia, whose palace he is also said to have decorated with paintings. According to Pliny (*N. H.*, xxxv. 62), he made an ostentatious display of his wealth at Olympia in having his name woven in letters of gold on his dress. But, as there would not be much ostentation in that, and as Pliny at times makes mistakes in translating from his Greek sources, it is possible that Zeuxis may merely have presented some piece of tapestry to a temple at Olympia with the customary inscription woven in letters of gold. Under his picture of an Athlete (12) he wrote that "It is easier to revile than to rival" (*μωμήσεταί τις μᾶλλον ἢ μιμήσεται*). A contemporary, Isocrates (*De Permut.*, 2), remarks that no one would say that Zeuxis and Parrhasius had the same profession as those persons who paint *pinakia*, which is equivalent to the vase-painters of the time. We possess many examples of the vase-painting of the period *circa* 400 B.C., and it is noticeable on them that there is great freedom and facility in drawing the human form, so as to suggest roundness and perspective. In the absence of fresco paintings of that date we have only these vases to fall back upon. Yet, with their limited resources of color and perspective, they in a measure show the influence of Zeuxis, while, as would be expected, they retain perhaps more of the largeness of form of older times. It is said that he died of laughter at the quaintness of a picture he had painted of an Old Woman.

ZHITOMIR, or JITOMIR, a town of western Russia, capital of the government of Volhynia, is situated on the Tetereff river, 646 miles to the southwest of Moscow. The railway which connects Riga and Königsberg with Odessa, *via* Berditcheff, passes within 27 miles of the old Lithuanian city without sending a branch towards it; and the whole place, with its old abandoned mansions of the Polish nobility, has an air of decay. Nor is it rich in historical monuments of its troubled past, its churches and cathedral mostly dating from the 18th century. Its population, however, reached 54,830 in 1884,—Jews constituting more than one-third of the total. Two large printing offices in Zhitomir issue nearly one-half of all the Hebrew books printed in Russia. The Jewish merchants carry on a considerable export trade in the agricultural produce of the plains surrounding the city, as also in timber and wooden wares from the forests to the north.

Zhitomir is a very old city, tradition tracing its foundation as far back as the times of Askold and Dir. The annals, however, mention it chiefly in connection with invasions of the Tartars, who plundered it in the 13th, 14th, and even the 17th century (1606), or in connection with destructive conflagrations. It fell under Lithuanian rule in 1320, and during the 15th century was one of the fifteen chief cities of the kingdom. Later on it became part of Poland, and when the Cossacks rose under Khmelnitsky (1648) they sacked the town. It became annexed to Russia along with the rest of the Ukraine.

ZIMMERMANN, JOHANN GEORG, RITTER VON (1728-1795), a Swiss philosophical writer and physician, was born at Brugg, in the canton of Aargau, on 8th

December, 1728. He studied at Göttingen, where he took the degree of doctor of medicine. Afterwards he practiced as a physician in his native place, and here he wrote *Ueber die Einsamkeit* (1755) and *Vom Nationalstolz* (1758). These books made a great impression in Germany, and were translated into almost every European language. They are now only of historical interest. In Zimmermann's character there was a strange combination of sentimentalism, melancholy, and enthusiasm; and it was by the free and eccentric expression of these qualities that he excited the interest of his contemporaries. Another book by him, written at Brugg, *Von der Erfahrung in der Arzneiwissenschaft* (1764), also attracted much attention. In 1768 he settled at Hanover as private physician of George III. with the title of Hofrath. Catherine II. invited him to the court of St. Petersburg, but this invitation he declined. He attended Frederick the Great during that monarch's last illness, and afterwards issued various books about him, of which the chief were *Ueber Frederich den Grossen und meine Unterredung mit ihm kurz vor seinem Tode* (1788) and *Fragmente über Friedrich den Grossen* (1790). These writings display extraordinary personal vanity, and convey a wholly false impression of Frederick's character. Zimmermann died at Hanover on 7th October, 1795.

See *Zimmermann's Briefe an einige seiner Freunde in der Schweiz* (1830) and Bodemann's *Johann Georg Zimmermann* (1878).

ZINC, the name both of an important commercial metal and of the element of which the metal consists.[1] Zinc as a component of brass had currency in metallurgy long before it became known as an individual metal. Aristotle refers to the alleged fact that the Mossinecians produced a bright and light-colored *χαλκός*, not by addition of tin, but by fusing up with an earth. Pliny explicitly speaks of a mineral *cadmia* as serving for the conversion of copper into *aurichalcum*, and says further that the deposit (of ZnO) formed in the brass furnaces could be used instead of the mineral. The same process was used for centuries after Pliny, but its rationale was not understood. Stahl, as late as 1702, quoted the formation of brass as a case of the union of a metal with an earth into a metallic compound; but he subsequently adopted the view propounded by Kunkel in 1677, that cadmia is a metallic calx, and that it dyes the copper yellow by giving its metal up to it. In 1597 Libavius described a "peculiar kind of tin" which was prepared in India, and of which a friend had given him a quantity. From his account it is quite clear that that metal was zinc, but he did not recognize it as the metal of calamine. It is not known to whom the discovery of isolated zinc is due;[2] but we do know that the art of zinc-smelting was practiced in England from about 1730. The first Continental zinc-works were erected at Liége in 1807. The atomic weight of zinc is 65.37 (the mean of the results obtained by Marignac and Baubigny), O = 16.

Zinc Ores.—The following may be named as important.

(1) *Red Zinc Ore* (impure ZnO) occurs in quartz-like crystals, but more frequently presents itself in large grained and lamellar masses. Sp. gr. 5.4 to 5.7. Color, hyacinth-red to brown. Lustre, adamantine.

(2) *Franklinite* ($RO.M_2O_3$, where R stands for Zn, Fe, Mn; M for Fe, Mn). The zinc averages about 10 per cent. It crystallizes in regular octahedra, with rounded-off edges and angles. Sp. gr. 5. 1. Color, black; streak, reddish-brown. Lustre, sub-metallic. This and the preceding occur in association with each other and other things in New Jersey, U. S.

(3) *Calamine* ($ZnCO_3$). The pure mineral (zinc spar) forms well-defined, though small, rhombohedra. The ordinary ore is massive, and is contaminated, often largely, with clay, silica, oxide of iron, and the like. Sp. gr. 4 to 4.5. Sometimes colorless, but as a rule light gray, yellow, or buff-colored. Lustre, vitreous. It is found in association with silicates of zinc, zinc-blende, and lead ores, chiefly in limestone and dolomitic strata, at the Kelmisberg or Vieille Montagne in Belgium, in Derbyshire and Northumberland, and in Silesia; but these last deposits are well nigh exhausted. Irregular deposits occur near Santander and Cartagena in Spain, and in Sardinia. At Wiesloch in Baden a yellow variety is found, which contains as much as 3 per cent. of cadmium. Smaller percentages of cadmium are met with in many other zinc ores.

(4) *Electric Calamine*, the German *Kieselzinkerz* ($ZnOSiO_2 + H_2O$), is also called *hemimorphite* on account of the marked hemimorphism in its (ortho-rhombic) crystals. Sp. gr. 3.35 to 3.5. Sometimes colorless, but more frequently gray, yellow, red, green, brown, blue,—always, however, light-colored. Lustre, vitreous. The crystals, when heated, exhibit electric polarity; hence the name. As a rule they are small and united into cuneiform, spheroidal, or kidney-shaped masses; there are also granular, dense, and earthy varieties. It occurs with willemite and calamine at the Altenberg near Aix-la-Chapelle, with blende and lead ore at Raibel and Bleiberg in Carinthia, near Iserlohn in Westphalia, at Matlock in Derbyshire, near Tarnowitz in Silesia, at Olbnes, Rezbanya in Hungary, and Nertchinsk in Siberia. American sources are at Phœnixville and Friedensville in Pennsylvania and in the Austin mine in Virginia.

(5) *Willemite*, anhydrous $ZnOSiO_2$ occurs in New Jersey and elsewhere; it is a comparatively rare ore.

(6) *Zinc-Blende*, or shortly *Blende* (ZnS).—The five ores mentioned above, as indeed all oxidized zinc ores, having become scarce, most of the zinc which now occurs in commerce is derived from zinc-blende. This ore crystallizes in combinations of the two tetrahedra and other forms of the regular system. Sp. gr. 3.9 to 4.2. Color, green, yellow, red, but mostly brown or black. Colorless crystals are scarce. Lustre, fatty or diamond-like. The ordinary ore forms crypto-crystalline or fibrous or granular masses, which sometimes present the form of kidneys, consisting of concentric layers. The finest crystals are found in Franklin, New Jersey, which are colorless and consist of pure ZnS, and in the Peñas de Europa, Asturias (Spain), in which liquid enclosures are often met with. The darker varieties, which always include more or less of foreign sulphides, are found in a great number of places. In Cornwall, Wales, Alston Moor in Cumberland, Teesdale in Yorkshire, Derbyshire, and the Isle of Man dark-colored blende is found in the lead-mining districts with galena, quartz, and limestone. In Belgium and on the Rhine massive blende occurs with iron pyrites and galena; this ore requires a great deal of sorting to become fit for smelting. In Sweden blende is frequently found: at Ammeberg on Lake Wetter a vast deposit occurs in the gneiss. To English miners blende is known as "black Jack," to the South Americans as "chumbe." The principal American deposits are in Missouri.[3]

Metallurgy.—Oxide of zinc, like most heavy metallic oxides, is easily reduced to the metallic state by heating it to redness with charcoal; but as zinc has the exceptional property of being readily volatile at the temperature of its reduction, the operation must be carried out in some kind of retort, and the zinc be recovered as a distillate. To pure red zinc ore the operation of distilling with charcoal might be applied quite directly; and the same might be done with pure calamine of any kind, because the carbonic acid of carbonate of zinc goes off below redness and the silica of silicate of zinc only retards, but does not prevent, the reducing action of the charcoal. Zinc-blende, however, being sulphide of zinc, is not directly reducible by charcoal; but it is easy to convert it into oxide by roasting: the sulphur goes off as sulphurous acid, whilst the zinc remains in the (infusible) form of oxide, ZnO. In practice, however, we never have to deal with pure zinc minerals, but with complex mixtures, which must first of all be subjected to mechanical operations, to remove at least part of the gangue, and if possible also of the heavy metallic impurities (see METALLURGY, vol. xvi. p. 66 *sq.* And, supposing this to be done, the ore, even if it is not blende, must be roasted, in order to remove all volatile components as completely as possible, because these, if allowed to remain, would carry away a large proportion of the zinc vapor during the distillation. If the zinc

[1] [Metallic zinc of commerce is frequently called spelter.—AM. ED.]

[2] [Metallic zinc was first mentioned by Paracelsus (1493–1541).—*Watt's Dict. Chem.* v. 1067.—AM. ED.]

[3] [See vol. xxiii. p. 870, for Zinc production in the United States.—AM. ED].

is present as blende, this operation offers considerable difficulties, because in the roasting process the sulphide of zinc passes in the first instance into sulphate, which demands a high temperature for its conversion into oxide. Another point to be considered in this connection is that the masses of sulphurous acid evolved, being destructive of vegetable life, are an intolerable nuisance to the neighborhood in which the operations take place.

Hasenclever and Helbig have constructed a furnace by which some two-thirds of the sulphurous acid can be conducted into chambers and condensed into the useful form of oil of vitriol. Figs. 1, 2, and 3 show how the furnace is constructed. *k* is a Siemens gas furnace, *n* being the orifice for the introduction of the fuel; the gases go out at *m*, where they mix with air; the flame travels between the sole *g* and the bottom of the muffle *c*, and then goes along the top of the muffle to the flue *q*; it passes below the slantiug canal *bb* and keeps it at a temperature below the fusing-point of antimony (432° C.). The ore is introduced through the funnel *a*; it slides down the slanting canal *bb*; the partition

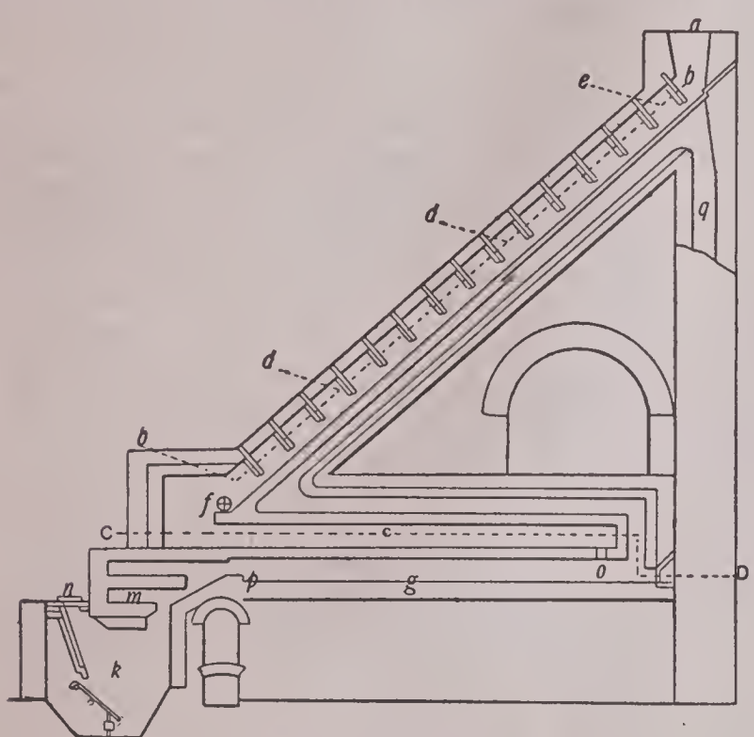

FIG. 1.—Longitudinal section along A B of Fig. 2.

walls *d*, *d*, which follow each other at distances of half a meter, compel it to spread out evenly into a thin layer. The partition walls as shown by Fig. 3, are arranged so that

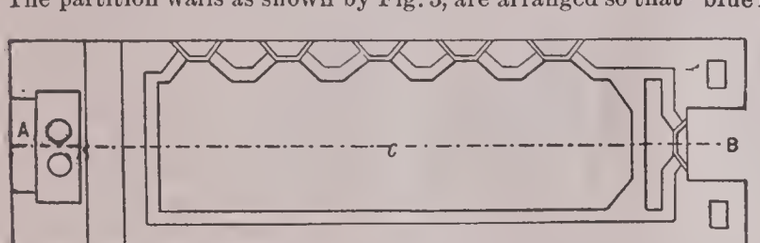

FIG. 2.—Horizontal section along C D of Fig. 1.

the gases coming from the muffle must travel along an undulating line and lick up as much as possible of the sulphur of the ore. From the last compartment *e* the gaseous product goes first to a cooling chamber, and thence to the

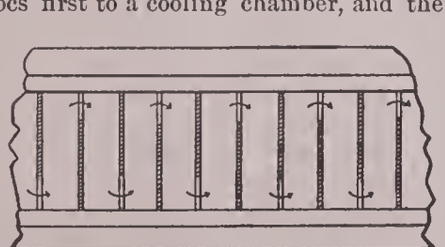

FIG. 3.

vitriol chamber. The hollow cylinder *f*, which is cooled internally by air while made to revolve, conveys the ore in instalments from the bottom end of the canal to the muffle. At intervals of two hours it is spread evenly on the bottom of the muffle, and at last it is drawn out through *o* and transferred to the sole *g*, to be finally roasted ("todtgeröstet") there. The apparatus works very satisfactorily even with ores poor in sulphur. An ore containing 20 per cent. of sulphur contained at the end *f* of the inclined canal 10 per cent., at the end *o* of the muffle 6.4 per cent., and at last, when "todtgeröstet," only 1.2. About one-third of the sulphur is lost. *i.e.*, goes out through the chimney, as SO_2.

The distillation process in former times, especially in England, used to be carried out "per descensum." The bottom of a crucible is perforated by a pipe which projects into the crucible to about two-thirds of its height. The powdery mixture of ore and charcoal is put into the crucible around the pipe, the crucible closed by a luted-on lid, and placed in a furnace constructed so as to permit of the lower end of the pipe projecting into the ash-pit. The zinc vapor produced descends through the pipe and condenses into liquid zinc, which is collected in a ladle held under the outlet end of the pipe. For manufacturing purposes a furnace similar to that used for the making of glass was employed to heat a circular row of crucibles standing on a shelf along the wall of the furnace. This system, however, has long been abandoned; at present one or other of the following methods is used as a rule.

In the *Belgian process* the reduction and distillation are carried out in cylindrical retorts of fire-clay, about a metre long and 0.15 metre wide inside. Some forty-six or more retorts, arranged in eight parallel horizontal rows, are heated in one furnace. The furnaces are square and open in front, to allow the outlet ends of the retorts to project; they are grouped together by fours; and their several chimneys are within the same enclosure. Each retort is provided with two adapters, namely, a conical pipe of fire-clay, about 0.4 metre long, which fits into the retort end, and a conical tube of black sheet iron, which fits over the end of the fire-clay pipe, and which at its outlet end is only 2 centimetres wide. To start a new furnace, the front side is closed provisionally by a brick wall, a fire lighted inside, and the temperature raised very gradually to a white heat. After four days' heating the provisional front wall is removed piecemeal, and the retorts, after having been heated to redness, are inserted in corresponding sets. The charge of the retorts consists of a mixture of 1100 lb of roasted calamine and 550 lb of dry powdered coal per furnace. A newly-started furnace, however, is used for a time with smaller charges. Supposing the last of these preliminary distillations to have been completed, the residues left in the retorts are removed and the retorts, as they lie in the hot furnace, are charged by means of semicylindrical shovels, and their adapters put on. The charging operation being completed, the temperature is raised, and as a consequence an evolution of carbonic oxide soon begins, and becomes visible by the gas bursting out into the characteristic blue flame. After a time the flame becomes dazzling white, showing that zinc vapor is beginning to escape. The iron adapters are now slipped on without delay, and left on for two hours, when, as a matter of experience, a considerable amount of zinc has gone out of the retort, the greater part into the fire-clay adapter, the rest into the iron cone. The former contains a mixture of semi-solid and molten metal, which is raked out into iron ladles and cast into plates of 66 to 77 lb weight, to be sold as "spelter." The contents of the iron recipient consist of a powdery mixture of oxide and metal, which is added to the next charge, except what is put aside to be sold as "zinc dust." This dust may amount to 10 per cent. of the total production. As soon as the adapters have been cleared of their contents, they are replaced, and again left to themselves for two hours, to be once more emptied and replaced, etc. The complete exhaustion of the charge of a furnace takes about 11 hours.

In the *Silesian process* the distillation is conducted in specially constructed muffles, which are arranged in two parallel rows within a low-vaulted furnace, pretty much like the pots in a glass furnace. As a rule every furnace accommodates ten muffles. Through an orifice in the outlet pipe (which during the distillation is closed by a loose plug) a hot iron rod can be introduced from time to time to clear the canal of any solid zinc that may threaten to obstruct it. As soon as the outlet pipe has become sufficiently hot the zinc flows through it and collects in conveniently placed receptacles. About 6 or 8 hours after starting the distillation is in full swing, and in 24 hours it is completed. A fresh charge is then put in at once, the muffles being

cleared only after three successive distillations. The distillate consists of a conglomerate of drops ("drop zinc"). It is fused up in iron basins lined with clay, and cast out into the customary form of cakes. In some modern works the muffles are heated by means of Siemens's regenerative gas furnace, by which a more uniform heat can be secured and maintained at a less cost.

Of the several metallic impurities in zinc ores iron is at once the most common and the least objectionable, because it is absolutely non-volatile at the temperature of a zinc retort; whenever commercial zinc contains iron, this comes from its having been re-fused in iron vessels after its distillation. Lead, though hardly volatile by itself at a red heat, if present in the ore, is, so to say, carried over by the zinc vapor, and passes at least partly into the distillate. Cadmium and arsenic being more volatile than zinc itself, if present, accumulate in the first fractions of the distillate, but may pervade it in traces to the end. Zinc made from oxidized ores is usually free from arsenic; that derived from blende is almost sure to contain it. This in practice is equivalent to saying that, while in former times it was easy, it is now very difficult, to obtain in commerce zinc free from arsenic. Traces of arsenic do not, however, interfere with any of the technical applications of the metal. As for cadmium, it is not (metallurgically speaking) an impurity at all, but, like silver in lead, a rather desirable admixture which it may be worth while to extract.

No reliable method is known by which commercial zinc could be purified so as to render it fit for all the purposes of the analyst; the only way to obtain really pure zinc is to prepare it from pure oxide by distillation with charcoal in a non-metallic retort.

Properties of Pure Zinc.—Zinc, a bluish-white metal, fuses at 415° C. and under ordinary atmospheric pressure boils at 1040° C. (Deville and Troost). The molten metal on cooling deposits crystals, and at last freezes into a compact crystalline solid, which may be brittle or ductile according to circumstances. According to Bolley, if zinc be cast into a mould at a red heat, the ingot produced is laminar and brittle; if cast at just the fusing-point, it is granular and sufficiently ductile to be rolled into sheet at the ordinary temperature. According to some authorities, pure zinc always yields ductile ingots. A clue to the explanation of these anomalous facts is afforded by certain observations of Gustav Rose and others, from which it appears that zinc is dimorphous and may or may not crystallize in the regular system. Supposing a mass of molten zinc to freeze into, say, cubes, the ingot will be ductile; an ingot of, say, rhombohedra, on the other hand, is almost bound to be brittle, because the crystals are orientated in a lawless fashion, and, as they cannot be expected to contract at the same rate in all directions, we must be prepared for a brittle ingot. Commercial "spelter" always breaks under the hammer; but at 100° to 150° C. it is susceptible of being rolled out into even a very thin sheet. Such a sheet, if once produced, remains flexible when cold. At about 200° C., again, the metal becomes so brittle that it can be pounded in a mortar. The specific gravity of zinc cannot be expected to be perfectly constant; according to Karsten, that of pure ingot is 6.915, and rises to 7.191 after rolling. The coefficient of linear expansion is 0.002,905 for 100° from 0° upwards (Fizeau). The specific heat is 0.093,93 (Schüller and Wartha). Compact zinc is bluish white; it does not tarnish much in the air. It is pretty soft, and clogs the file. If zinc be heated up to near its boiling-point, it catches fire and burns with a brilliant light into its powdery white oxide, which forms a reek in the air (*lana philosophica*). Boiling water attacks it appreciably, but no more, with evolution of hydrogen and formation of hydroxide, $Zn(OH)_2$. A rod of perfectly pure zinc, when immersed in dilute sulphuric acid, is so very slowly attacked that there is no visible evolution of gas; but, if a piece of platinum or other less basilous metal is brought into contact with the zinc, it dissolves readily, with evolution of hydrogen and formation of sulphate. The ordinary impure metal dissolves at once, the more readily the less pure it is. Cold dilute nitric acid dissolves zinc as nitrate, with evolution of nitrous oxide, N_2O, and formation of nitrate of zinc. At higher temperatures, or with stronger acid, nitric oxide, NO, is produced besides or instead of nitrous.

Oxide of Zinc, ZnO.—There is only this one oxide. It is prepared chiefly in two ways,—(1) by burning the metal, a method now being carried out industrially, the zinc vapor being sometimes produced *extempore* from a mixture of roasted ore and carbon, and (2) by heating the basic carbonate (see below). It is an infusible solid, which is intensely yellow at a red heat, but on cooling becomes white. This at least is true of the oxide produced from the metal by combustion; that produced from the carbonate, if once made yellow at a red heat, retains a yellow shade permanently. Oxide of zinc is insoluble in water, and does not combine directly with it; it dissolves readily in all aqueous acids, with formation of "zinc salts." It also dissolves in aqueous caustic alkalies, including ammonia, forming "zincates" (*e.g.*, ZnO.KHO). Oxide of zinc is used in the arts as a white pigment; it has not by any means the covering power of white lead, but offers the advantage of being non-poisonous and of not becoming discolored in sulphuretted hydrogen. It is used also in medicine, chiefly externally.

The *hydrate*, $Zn(OH)_2$, is prepared by precipitating a solution of any zinc salt with caustic potash. The alkali must be free from carbonate and an excess of it must be avoided, otherwise the hydrate re-dissolves. It is a white powder, and is insoluble in water. To acids and to alkalies it behaves like the oxide, but dissolves more readily.

The *basic carbonate*, $ZnCO_3.xZn(OH)_2$, where x is variable, is prepared by precipitation of a solution of the sulphate or chloride with carbonate of soda. To obtain a product free of Cl or SO_4, there must be an excess of alkali and the zinc salt must be poured into the hot solution of the carbonate. The precipitate, even after exhaustive washing with hot water, still contains a trace of alkali; but from the oxide, prepared from it by ignition, the alkali can be washed away. The basic carbonate is, like the oxide, used as a pigment. Normal carbonate of zinc, $ZnCO_3$, has never been prepared artificially, but it exists in nature as zinc spar.

The *sulphate*, $ZnSO_4 + 7H_2O$, white vitriol, is prepared by dissolving the ordinary metal in dilute sulphuric acid. If care be taken to keep the zinc in excess, the solution will be free from all foreign metals except iron and perhaps manganese. Both are easily removed by passing chlorine through the cold solution, to produce ferric and manganic salt, and then digesting the liquid with a washed precipitate of basic carbonate, produced from a small portion of the solution by means of carbonate of soda. The iron and manganese are precipitated as hydrated sesquioxides, and are filtered off. The filtrate is acidified with a little sulphuric acid and evaporated to crystallization. The salt crystallizes out on cooling with 7 molecules of water, forming colorless ortho-rhombic prisms, usually small and needle-shaped. They are permanent in the air. According to Poggiale, 100 parts of water dissolve respectively of ($7H_2O$) salt

115.2, 138.2, 161.5, 263.8, 442.6, and 653.6 parts
at 0°, 10°, 20°, 50°, 80°, and 100° C.

At 100° C. the crystals lose 6 of their $7H_2O$'s; the rest of the water goes off only at a higher temperature, which lies close to that at which the salt begins to decompose. The anhydrous salt, when exposed to a red heat, breaks up into oxide, sulphuric dioxide, and oxygen. An impure form of the salt is prepared by roasting zinc-blende at a low temperature. Sulphate of zinc is used in medicine, chiefly externally. In the arts it is employed in the preparation of varnishes, and as a mordant for the production of colors on calico. A green pigment known as *Rinmann's green* is prepared by mixing 100 parts of zinc vitriol with 2.5 parts nitrate of cobalt and heating the mixture to redness, to produce a compound of the two oxides. Sulphate of zinc, like sulphate of magnesia, unites with the sulphates of the potassium metals and of ammonium into crystalline double salts, $ZnSO_4.R_2SO_4 + 6H_2O$, isomorphous with one another and the magnesium salts.

The *chloride*, $ZnCl_2$, is produced by heating the metal in dry chlorine gas, when it distils over as a white translucent mass, easily fusible, and boiling sufficiently low to be distillable from out of a retort of hard Bohemian glass. Its vapor-density at 900° C. is 4.57, air = 1, corresponding to $ZnCl_2$ (V. and C. Meyer). Chloride of zinc is extremely hygroscopic; it dissolves in a fraction of its weight of even cold water, forming a syrupy solution. A solution of chloride of zinc is easily produced from metal and hydrochloric acid, but it cannot be evaporated to dryness without con-

siderable decomposition of the hydrated salt into oxy-chloride and hydrochloric acid. A concentrated solution of chloride of zinc converts starch, cellulose, and a great many other organic bodies into soluble compounds; hence the application of the fused salt as a caustic in surgery, and the impossibility of filtering a strong $ZnCl_2$ lye through paper. At a boiling heat chloride of zinc dissolves in any proportion of water, and highly concentrated solutions, of course, boil at high temperatures; hence they afford a convenient medium for the maintenance of high temperatures.

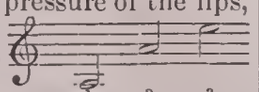
Oxide of zinc unites with the chloride in a great number of proportions, forming oxy-chlorides. A (mixed) compound of this order is used as a cement for stuffing teeth and other purposes. One part of extremely fine glass powder is mixed with three of finely powdered oxide of zinc, free from carbonic acid. On the other hand, one part of borax is dissolved in the least sufficiency of hot water and added to fifty parts of solution of chloride of zinc of 1.5 to 1.6 sp. gr. Immediately before use the powder is made into a paste with the solution; it hardens in a few minutes, forming a stone-like mass.

For other zinc compounds, the reader is referred to the handbooks of chemistry.

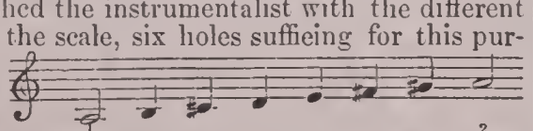
Analysis.—From neutral solutions of its salts zinc is precipitated by sulphuretted hydrogen as sulphide, ZnS,—a white precipitate, soluble, but by no means readily, in dilute mineral acids, but insoluble in acetic acid. In the case of acetate the precipitation is quite complete; from a sulphate or chloride solution the greater part of the metal goes into the precipitate; in the presence of a sufficiency of free HCl the metal remains dissolved; sulphide of ammonium precipitates the metal completely, even in the presence of ammonia salts and free ammonia. The precipitate, when roasted at the end of an asbestos stick over a "bunsen," passes into oxide, which is yellow in the heat and white after cooling; and, if it be moistened with cobalt solution and re-heated, it exhibits a green color after cooling. By these tests the precipitate is easily identified with certainty. For further information see handbooks of analysis. (W. D.)

ZINCKEN, or ZINKEN, the German name of a family of wind instruments now obsolete, known in Italy as *cornetti*, in France as *cornets à bouquin*, and in England as "cornets," but differing entirely from the modern *cornets à pistons;* these last will also be noticed here, as bearing the same name.

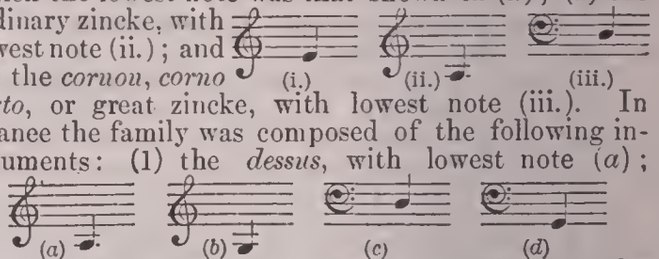
The old cornets were of two kinds,—the straight and the curved. The straight (Germ. *gerade Zincken*, *stille Zincken;* Ital. *cornetti*, *diritti*, *cornetti muti*) were usually made with the mouthpiece (a cupped mouthpiece analogous to that of the trumpet) forming part of the tube. The curved (Germ. *krumme Zincken;* Ital. *cornetti curvi*) are formed of two pieces of wood of different lengths, each having half the channel in which the column of air is to vibrate hollowed out, the diameter increasing from the mouthpiece towards the lower end. The two pieces of wood, when thus prepared, are joined together with glue; they are then finished off so as to form a pipe with eight sides, and are finally covered with leather. The mouthpieces are made of wood, horn, or ivory, and are fixed by a tenon to the upper extremity of the pipe. The primitive instrument was an animal's horn. Pipes of such small length give only, besides the first or fundamental, the second and sometimes the third note of the harmonic series. Thus, a pipe that has for its fundamental note A will, if the pressure of the lips, be steadily increased, give the octave A and the twelfth E. To



connect diatonically the first and second, the length of the pipe was progressively shortened, by making holes in its substance for the fingers to cover. The opening of these holes successively furnished the instrumentalist with the different intervals of the scale, six holes sufficing for this purpose: The fundamental was thus



connected with its octave by all the degrees of a diatonic scale which could become chromatic by the help of cross fingerings and greater or less pressure of the lips within the mouthpiece. The fingering was completed by a seventh hole, which had for its object the production of the octave without the necessity of closing all the holes in order to produce the second note of the harmonic series. The first complete octave, thus obtained by a succession of fundamental notes, is easily octaved by a stronger pressure of the lips against the mouthpiece, and thus the ordinary limits of the compass of a zinck or cornet extend to a fifteenth. Whether straight or curved, it is pierced laterally with seven holes, six through the front and the seventh, that nearest to the mouthpiece, through the back. The first three holes were usually covered with the third, second, and first fingers of the right hand, the next four with the third, second, and first fingers and the thumb of the left hand. But some instrumentalists inverted the position of the hands. Virdung[1] shows a kind of zinck made of an animal's horn with only four holes, three at the back of the pipe and one in front. Such an instrument as this had naturally a very limited compass, since with the help of these four holes only the intermediate notes between the second and third proper tones of the harmonic scale could be produced, the lower octave comprised between the first and second remaining incomplete. At the beginning of the 17th century Prætorius[2] represents the zinken as a complete family arranged thus: (1) the little zinck, of which the lowest note was that shown in (i.); (2) the ordinary zinck, with lowest note (ii.); and (3) the *cornou*, *corno torto*, or great zinck, with lowest note (iii.). In France the family was composed of the following instruments: (1) the *dessus*, with lowest note (*a*);



(2) the *haute-contre*, with lowest note (*b*); (3) the *taille*, with lowest note (*c*); and (4) the *basse*, with lowest note (*d*). Numbers (2), (3), and (4) in this last series were sometimes furnished with an open key, which, when the closed tube was lengthened, augmented the compass downwards by a note.

During the Middle Ages these instruments were in such favor that an important part was given to them in all instrumental combinations. In Germany, in the 18th century, they were used with trombones in the churches to accompany the chorales. There are examples of this employment in the sacred cantatas of J. S. Bach. Monteverde made use of them in his opera *Orfeo* in 1608, as did Gluck in the opening chorus of his *Orfeo*, played at Vienna in 1762. The great vogue of the zinck is not to be accounted for by its musical qualities; for it has a hard, hoarse, piercing sound, and it failed utterly in truth of intonation; and these natural defects could only be modified with great difficulty. It is now hard to understand Mersenne's eulogium of the *dessus*, then more employed than the other cornets, "because it was used in vocal concerts and to make the treble with the organ, which is ravishing when one knows how to play it to perfection, like the Sieur Quiclet," and, farther on, "as to the property of its tone, it resembles the brilliancy of a sunbeam piercing the darkness, when it is heard among the voices in churches, cathedrals, or chapels."

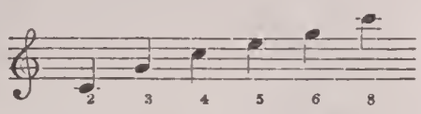
The *serpent* is another instrument of the cornet family, though not usually classed with it. Its construction and its acoustic principles are the same as these of the old cornet. It is, properly speaking, an enlarged cornet with one hole less, that which is stopped with the thumb. The mouth-piece is fixed to the instrument by means of a long brass crook. A detailed account of the serpent and its congeners is given under OPHICLEIDE (vol. xvii. pp. 799, 800). The zinck or cornet has now entirely disappeared, and the rare specimens still met with are eagerly sought

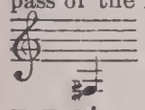
[1] *Musica getutscht und ausgezogen*, Basel, 1511.
[2] *Syntagmatis Musici*, vol. ii.; *De Organographia*, Wolfenbüttel, 1618.

by collectors. The serpent has lasted longest, and even within the last twenty years has been used in many churches in the south of France.

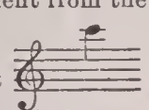
Cornet, Cornet à Pistons.

At present the names of cornet, cornet à pistons, and cornopean are given to an instrument that has no analogy whatever to the mediæval cornet. It is a transformation of the old post-horn, with a shorter tube than that of the trumpet, and improved to such a degree that its quality of tone is intermediate between the brightness of the trumpet and the softuess of the flügel-horn or bugle with pistons. The extent of the modern cornet without pistous is comprised within the second and eighth of the harmonic scale. The seventh, being too flat, owing to a well-known acoustic phenomenon, is rarely used. The cornet à pistons of the highest pitch is in B♭, and is used for a trumpet in that key. The notes written therefore sound a major second lower than the notation. It is furnished with three pistons, which lower the priucipal tube by a whole toue (1st piston), a half tone (2d piston), and a tone and a half (3d pistou) respectively. It has already been explained under Trombone how the different pistons are combined to produce the eutire chromatic compass of the instrument from the lowest limit





to the highest



At first the cornet à pistons was supplied with a great mauy crooks. There were crooks for A, A♭, G, F, E, E♭, and D; but it is easy to understand that, if the additional tubes put in communication with the principal column of air by means of the pistons are adjusted for the key of B♭, the same additional tubes are too short to fulfil the same office for an instrument lowered to the extent of a minor sixth, as it would be for the key of D. Hence nearly all these crooks have disappeared, only those for B♭, A, and A♭ being retained. The invention of the modern cornet, or more exactly the application of pistons to the post-horn, is German, and dates from the first quarter of the 19th century, almost immediately after the invention of pistons by Stölzel and Blümel. It was introduced into Great Britain and France about 1830. There were at first only two pistons,—that of the whole tone and that of the half tone,—from which there naturally resulted gaps in the chromatic scale of the instrument. The history of the cornet is that of the improvement brought about by pistons apart from their successive transformations, and it has remained to the present time what it was when first invented. The great favor the cornet meets with is due to the facility with which it speaks, to the little fatigue it causes, and to the simplicity of its mechanism. We may, however, regret, from the point of view of art, that its success has been so great, and that it has ended by usurping in brass bands the place of the bugles, the quality of their tone being infiuitely preferable as a foundation for an ensemble composed exclusively of brass instruments. Even the symphonic orchestra has not been secure from its intrusion. In fact, the cornet is taking the place of the trumpet nearly everywhere, and, if care is not taken, the latter will in a few years have completely disappeared, to the great detriment of orchestral tone color; for the quality of tone of the cornet cau never be an adequate substitute for the brilliant aud majestic sonorousness so characteristic of the trumpet. (V. M.)

ZINZENDORF, Nicolaus Ludwig, Count of Zinzendorf and Pottendorf (1700–1760), religious reformer, descended from an ancient family belonging to Lower Austria, was born on 26th May, 1700, at Dresden. His family had taken the Protestant side in the Reformation struggle, and in consequence his grandfather, Max Erasmus, had abandoned his Austrian estate to settle near Nuremberg. Max's second son, George Louis, was a member of the Saxon cabinet and a personal friend of the Pietist Spener. George's second wife, Charlotte Justine, the mother of Nicolaus, who was an only son, was a daughter of Nicolas and Catherine von Gersdorf, who were also Pietist. The boy was thus born into a Pietist circle; and Spener was his godfather. He never knew his father, who died six weeks after he was born. His mother married again when he was four years old, and he was educated under the charge of his pious and gifted grandmother,[1] Catherine von Gersdorf, to whom more than to any other he was indebted for the absorbing and enthusiastic piety which characterized him from childhood. His school days were spent at the pædagogium at Halle amidst Pietist surroundings, and in 1716 he went to the university of Wittenberg, to study law and fit himself for a diplomatic career. Three years later he was sent to travel in Holland, in France, and in various parts of Germany. These two years of wandering were employed by him in making the personal acquaintance of men distinguished for practical piety and belonging to a variety of churches. On his return he visited the branches of his family settled at Oberbirg and at Castell. During a lengthened visit at Castell he fell in love with his cousin Theodora; but the widowed countess, her mother, objected to the marriage, and the lady afterwards became the wife of Count Henry of Reuss. Zinzendorf seems to have considered this disappointment to be a call in providence to betake himself to some special work for God. He had previously, in deference to his family, who wished him to become a diplomatist, rejected the invitation of Francke to take Count Canstein's place in the Halle orphanage; and he now resolved to settle down as a Christian landowner, spending his life on behalf of a pious tenantry. He bought Berthelsdorf from his grandmother, and selected John Andrew Rothe for pastor and John George Heiz for factor; he married Erdmute Dorothea, sister of Count Henry of Reuss, and began living on his estate. His intention was to carry out into practice the Pietist ideas of Spener. He did not mean to found a new church or religious organization distinct from the Lutheranism of the land. He meant to create a Christian association, the members of which by preaching, by tract and book distribution, and by practical benevolence might awaken the somewhat torpid religion of the Lutheran Church. The "band of four brothers" (Rothe, pastor at Berthelsdorf; Schäffer, pastor at Görlitz; Francis von Wattewille, a friend from boyhood; and himself) set themselves by sermons, books, journeys, and correspondence to create a revival of religion, and by frequent meetings for prayer to preserve in their own hearts the warmth of personal trust in Christ. From the printing establishment at Ebersdorf large quantities of books and tracts, catechisms, collections of hymns, and cheap Bibles were issued; and a translation of Arndt's *True Christianity* was published for circulation in France. Dislike to the high and dry Lutheran orthodoxy of the period gave Zinzendorf some sympathy with that side of the growing rationalism which was attacking dogma, while he at the same time felt its lack of earnestness, and of a true and deep understanding of religion and of Christianity, and endeavored to counteract its tendency by pointing men to the historical Christ, the revelation of the Father. It is also more than probable that he began to doubt the wisdom of Spener's plan of not separating from the Lutheran Church, and that he began to think that true Christianity could be best promoted by free association of Christians, who in course of time might grow into churches with no state connection. These thoughts of his took a practical turn from his connection with the Bohemian or Moravian Brethren. Zinzendorf offered an asylum to a number of persecuted wanderers from Moravia (see Moravian Brethren), and built for them the village of Herrnhut on a corner of his estate of Berthelsdorf. The refugees who came to this asylum—the first detachment under Christian David in 1722—and continued coming from various regions where persecution raged, for a succession of years (till 1732), belonged to more than one Protestant organization. Persecution had made them cling pertinaciously to the small peculiarities of creed, organization, and worship, and they could

[1] A volume of *Spiritual Songs*, written by Zinzendorf's grandmother Catherine, was published in 1729 by Anton.

scarcely be persuaded to live in peace with each other. Zinzendorf devoted himself to them. He, with his wife and children, lived in Herrnhut and brought Rothe with him. He had hard work to bring order out of the confusion. He had to satisfy the authorities that his religious community could be brought under the conditions of the peace of Augsburg; he had to quiet the suspicions of the Lutheran clergy; and, hardest of all, he had to rule in some fashion men made fanatical by persecution, who, in spite of his unwearied labors for them, on more than one occasion, it is said, combined in his own house to denounce him as the Beast of the Apocalypse, with Pastor Rothe as the False Prophet. Patience had at last its perfect work, and gradually Zinzendorf was able to organize his refugees into something like a *militia Christi*, based not on monastic but on family life. He was able to establish a common order of worship in 1727, and soon afterwards a common organization, which has been described in the article MORAVIAN BRETHREN. Zinzendorf took the deepest interest in the wonderful missionary enterprises of the Brethren, and saw with delight the spread of this Protestant family (not monastic) order in Germany, Denmark, Russia, and England. He travelled widely in its interests, visiting America in 1741–42 and spending a long time in London in 1750. Missionary colonies had by this time been settled in the West Indies (1732), in Greenland (1733), amongst the North American Indians (1735); and before Zinzendorf's death the Brethren had sent from Herrnhut missionary colonies to Livonia and the northern shores of the Baltic, to the slaves of North Carolina, to Surinam, to the Negro slaves in several parts of South America, to Travancore in the East Indies, to the Copts in Egypt, and to the west coast of South Africa. The community in Herrnhut, from which almost all these colonies had been sent out, had no money of its own, and its expenses had been almost exclusively furnished by Zinzendorf. His frequent journeyings from home made it almost impossible for him to look after his private affairs; he was compelled from time to time to raise money by loans, and about 1750 was almost reduced to bankruptcy. This led to the establishment of a financial board among the Brethren, on a plan furnished by a lawyer, John Frederick Köber, which worked well. In 1752, Zinzendorf lost his only son, Christian Renatus, whom he had hoped to make his successor; and four years later he lost his wife Erdmute, who had been his counsellor and confidante in all his work, and without whose wise guidance he could never have accomplished what he achieved. Zinzendorf remained a widower for one year, and then (June, 1757), contracted a second marriage with Anna Nitschmann, on the ground that a man in his official position ought to be married. Three years later, overcome with his labors, he fell ill and died (on 9th May), leaving John de Wattewille, who had married his eldest daughter Benigna, to take his place at the head of the community.

See Spangenberg, *Leben des Grafen von Zinzendorf*, 1772–75; Schrautenbach, *Der Graf. v. Zinzendorf*, 1871 (written in 1782, and interesting because it gives Zinzendorf's relations to such Pietist rationalists as Dippel); F. Bovet, *Le Comte de Zinzendorf*, 1860; Becker, *Zinzendorf im Verhältniss z. Philosophie u. Kirchenthum seiner Zeit*, 1886 (the best account; written by the author of the article "Zinzendorf" in Herzog-Plitt's *Encykl.*). See also the books mentioned under MORAVIAN BRETHREN. (T. M. L.)

ZION. See JERUSALEM and TEMPLE.

ZIRCONIUM, a rare element, closely allied to titanium. Klaproth in 1789 analyzed zircon and found it to contain a new earth, which he called "zirconia." Zircon is essentially a silicate of zirconia, $ZrO_2.SiO_2$. For the extraction from it of zirconia the mineral is first of all heated and quenched in water to render it brittle, and then reduced to a fine powder, which is fused up with three to four parts of acid fluoride of potassium at a gentle heat in a platinum crucible. When the mass fuses tranquilly and all the water is expelled, the platinum crucible is placed in a Hessian crucible; the two crucibles are then covered and kept for two hours at the highest temperature producible by means of a wind-furnace. The porcelain-like fuse is powdered, boiled in water, and acidified with hydrofluoric acid, and the residual fluosilicate of potassium is filtered off. The filtrate on cooling deposits crystals of fluozirconate of potassium, ZrF_6K_2, which are purified by re-crystallization from hot water. The double fluoride is decomposed with hot concentrated sulphuric acid; the mixed sulphate is dissolved in water; and the zirconia is precipitated with ammonia in the cold. The precipitate, being difficult to wash, is (after a preliminary washing) re-dissolved in hydrochloric acid and re-precipitated with ammonia. Hydrated zirconia, $Zr(OH)_4$, as thus obtained, is quite appreciably soluble in water and easily in mineral acids, with formation of zirconic salts, *e.g.*, $ZrCl_4$, analogous to $SnCl_4$. But, if the hydrate is precipitated in the heat, it demands concentrated acids for its solution. The hydrate readily loses its water at a dull red heat and passes into anhydride with vivid incandescence. The anhydrous oxide, ZrO_2, is with difficulty soluble even in hydrofluoric acid; but a mixture of two parts of concentrated sulphuric acid and one of water dissolves it on continued heating as $Zr(SO_4)_2$. Zirconia, when heated to whiteness remains unfused, and radiates out abundance of white light. This property has been utilized for the construction of a new kind of gas lamp, in which a colorless flame, produced by the combustion of a mixture of gas and air, serves to heat a hollow cylinder of zirconia suspended over it by means of platinum gauze. Zirconia, like oxide of tin and oxide of titanium, unites not only with acids but also with basic oxides. For instance, if it be fused up with an excess of carbonate of soda, 2 of CO_2 are expelled by every ZrO_2, with formation of ortho-zirconate (analogous to orthosilicate) of soda, $ZrO_2.2Na_2O$. On treating the fuse with water we obtain the salt $Na_2O.8ZrO_2 + 12H_2O$, which crystallizes in hexagonal plates.

Zirconic chloride, $ZrCl_4$, is prepared, by igniting a mixture of zirconia and charcoal in a current of chlorine, as a white sublimate. It has the exact vapor-density corresponding to the formula. It dissolves in water with evolution of heat; on evaporation a basic salt, $2ZrOCl_2 + 9H_2O$, separates out in star-shaped aggregates of needles.

Metallic zirconium is obtainable by heating the double fluoride of zirconium and potassium with metallic potassium, as an iron-gray powder. Troost produced crystallized zirconium by fusing the double fluoride with aluminium in a graphite crucible at the temperature of melting iron, and extracting the aluminium from the fuse with hydrochloric acid. The crystals look like antimony and are brittle; their specific gravity is 4.15. The powdery metal burns readily in air; the crystalline metal requires to be heated in an oxyhydrogen flame if it is to catch fire. Mineral acids generally attack the crystallized metal very little even in the heat; aqua regia, however, dissolves it readily, and so does hydrofluoric acid. The spark spectrum of zirconium is characterized by five lines, whose wave-lengths are as follows: 6127 in the red, and 4815, 4771, 4738, 4709, and 4686 in the blue. The atomic weight is not known exactly; according to Marignac and Deville, it lies near 90, if O = 16.

ZITTAU, the centre of the Saxon linen trade and the most populous town in the district of Bautzen, in the kingdom of Saxony, is situated on the left bank of the Mandau, near its confluence with the Neisse, 25 miles southeast of Bautzen and 48 east-southeast of Dresden. The town is built in a regular and modern style. The town-house dates from 1844, and contains a public library of 30,000 volumes. The church of St. John was rebuilt in 1834–37; and the church of St. Peter and St. Paul, with its elegant tower, belonged to an old Franciscan monastery. The

latter was restored in 1882 and part of it fitted up as an historical museum. There are five other churches in the town. Zittau is well equipped with schools, including a gymnasium (founded in 1586) and a commercial school, both accommodated in the Johanneum, and several technical institutions. The leading branch of industry is linen and damask weaving; but woollen stuffs, trimmings, etc., are also produced in the factories of the town, and in the surrounding weaving villages, 37 of which, with 70,000 inhabitants, are included in the municipal jurisdiction. The town, which is one of the best endowed in Saxony, also owns valuable forests on the mountains of Upper Lusatia. There are various steam-mills, iron-foundries, brick-fields, and potteries near the town, and extensive deposits of lignite, employing over 1000 hands. Zittau is situated near the border of Bohemia, with which it carries on some trade. In 1885 the population was 23,215, of whom less than one-fifth were Roman Catholics; in 1834 the population was 8508.

Zittau is of Wendish origin (Chytawa is its Wendish name), and was made a town by Ottocar II. of Bohemia. It was one of the six towns of the Lusatian league (1346), at which period it belonged to Bohemia. It suffered severely in the Hussite wars and in the Thirty Years' War, and was bombarded and burnt by the Austrians in 1757 during the Seven Years' War. The musical composer, Marschner, (1795–1861) was born at Zittau.

ZIZKA, or Ziska, John (*c.* 1360–1424) leader of the Hussites (*q.v.*) from 1419, was born at Trocznow in the neighborhood of Budweis in Bohemia about the year 1360. He was of noble descent, and was brought up from an early age at Prague at the court of King Wenceslaus. In 1410 he fought as a volunteer, on the losing side, in the great battle of Grünwald, near Tannenberg in Prussia, in which the knights of the Teutonic Order were completely routed by the Lithuanians and Poles. He afterwards took part in the Hungarian wars against the Turks, and is also said to have fought on the English side in the battle of Agincourt. In the discontents which followed the martyrdom of Huss and Jerome in Bohemia he sided with the liberal party, and ultimately, on the outbreak of hostilities, became its leader. He soon organized a formidable body of infantry, and from his newly fortified stronghold of Tabor as a centre achieved various successes, of which the most signal was the victory over the imperial troops at Deutschbrod (8th January, 1422). At an early period of the war,—at the siege of Raby in 1421,—Zizka, who from boyhood had been blind of an eye, completely lost his sight; but his strength of will enabled him almost wholly to overcome this formidable disadvantage, and his extraordinary presence of mind, fertility of resource, and keenness of mental vision, coupled with a zeal that was wholly sincere, though not always free from fanaticism, continued to mark him out as the leader in the cause he had espoused until his death, which was caused by an infectious disorder while he was besieging Przibislaw (11th October, 1424).

See Millauer, *Diplomatisch-historische Aufsätze über Johann Ziska* (1824). Ziska's life has been made the subject of an epic by the German poet Meissner (1846; 10th edition 1867), and has also been related in prose by George Sand.

ZLATOUST, in the Russian government of Ufa, is one of the chief towns and iron-works of the Urals. It is situated on the Ai, a tributary of the Ufa, in a picturesque valley of the middle Urals, at a height of 1200 feet above sea-level. The 270 miles which stretch between Zlatoust and Ufa in the west will soon be covered by rail, while a branch line is projected to connect it with Ekaterinburg in the north. The town is well built, mostly of wood, has a first-class meteorological and magnetic observatory, and is the seat of the mining administration for the Zlatoust district, which includes, besides several iron-works, the rich gold-washings of the basin of the Mias. Its merchants carry on a brisk trade in agricultural produce and cattle, as well as in manufactured wares, imported for the use of the mining villages of the neighborhood. The Ai and several ponds supply the crown iron-works with motive power, and in 1884 the iron furnaces of Zlatoust yielded 90,800 cwts. of pig-iron, which were used almost entirely for the manufacture of swords, bayonets, and artillery munition. The population of Zlatoust in 1884 was 19,000.

ZNAIM, or Znaym (Czech *Znojmo*), an interesting old town of Moravia, is picturesquely situated on the left bank of the Thaya, 45 miles north-northwest of Vienna. The town proper is adjoined by four suburbs, and it contains three fine open squares, while the site of the old fortifications is occupied by a pleasant promenade. The Räuberthurm is a relic of the old castle of the margraves of Moravia; the round castle-chapel, known as the heathen temple (Heiden-Tempel), in the Romanesque style of the 12th century, was at one time considered the most ancient building in Moravia. The Gothic church of St. Nicholas was built about 1348 by the emperor Charles IV.; the town-house, with an elegant Gothic tower, 250 feet high, dates from about 1446. The ancient and once powerful Præmonstratensian abbey of Bruck, to the east of the town, is now occupied as barracks. The town is well equipped with technical and other schools, and carries on manufactures of earthenware, leather, chocolate, vinegar, and other articles. Large quantities of cucumbers, grain, and wine are produced in the fertile environs. In 1880 the population, chiefly of German origin, was 12,254.

The present town of Znaim was founded in 1226 by Ottocar I. of Bohemia on the site of Znojmo, the ancient capital of the tributary margraves of Moravia, which had been destroyed in 1145. Znaim is best known to history for the armistice concluded here in 1809 after the battle of Wagram between Napoleon I. and the archduke Charles. In 1866 the Prussians occupied the town from July 13th till September 3d. The novelist, Karl Postel (1793–1864), who wrote under the pseudonym of Charles Sealsfield, was born at Poppitz, 2½ miles to the southwest.

ZODIAC (ὁ ζωδιακὸς κύκλος, from ζώδιον, "a little animal"), an imaginary zone of the heavens within which lie the paths of the sun, moon, and principal planets. It is bounded by two circles equidistant from the ecliptic, about eighteen degrees apart; and it is divided into twelve signs, and marked by twelve constellations. The signs—the Greek δωδεκατημόρια—are geometrical divisions thirty degrees in extent, counted from the spring equinox in the direction of the sun's progress through them. The whole series accordingly shifts westward through the effect of precession by about one degree in seventy-two years. At the moment of crossing the equator towards the north the sun is said to be at the first point of Aries; some thirty days later it enters Taurus, and so on through Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius, and Pisces (see Astronomy, vol. ii. p. 674). The constellations bearing the same names coincided approximately in position, when Hipparchus observed them at Rhodes, with the divisions they designate. The discrepancy, now, however, amounts to the entire breadth of a sign, the sun's path in Aries lying among the stars of Pisces, in Taurus among those of Aries, etc.

Definition.

Signs and constellations.

The twelvefold division of the zodiac was evidently suggested by the occurrence of twelve full moons in successive parts of it in the course of each year. This approximate relation was first systematically developed by the early inhabitants of Mesopotamia, and formed the starting-point for all their divisions of time. As the year separated, as it were of itself, into twelve months, so the day was divided into twelve "double hours," and the great cosmical period of 43,200 years into twelve "sars." Each sar, month, and hour was represented at once visibly and symbolically by a twelfth part of the "fur-

Duodenary division.

row" drawn by the solar Bull across the heavens. The idea of tracing the sun's path among the stars was, when it occurred to Chaldæan astronomers, an original and, relatively to their means, a recondite one. We owe to its realization by them the constitution and nomenclature of the twelve signs of the zodiac. Assyrian cylinders and inscriptions indicate for the familiar series of our text-books an antiquity of some four thousand years. Ages before Asurbanipal reigned at Nineveh, the eighth month (Marchesvan) was known as "the month of the star of the Scorpion," the tenth (Tebet) belonged to the "star of the Goat," the twelfth (Adar) to the "star of the Fish of Hea."[1] The motive underlying the choice of symbols is in a few cases obvious, but in most remains conjectural. The attributes of the deities appointed to preside over the months and signs were to some extent influential. Two of them, indeed, took direct possession of their respective portions of the sky. The zodiacal Virgo is held to represent the Assyrian Venus, Ishtar, the ruling divinity of the sixth month, and Sagittarius the archer-god Nergal, to whom the ninth month was dedicated. But no uniform system of selection was pursued; or rather perhaps the results of several, adopted at various epochs, and under the influence of varying currents of ideas became amalgamated in the final series.

First sign.

This, there is reason to believe, was the upshot of a prehistoric reform. So far as positive records go, Aries was always the first sign. But the arrangement is, on the face of it, a comparatively modern one. None of the brighter stars of the constellation could be said even roughly to mark the equinox much before 1800 B.C.; during a long stretch of previous time the leading position belonged to the stars of Taurus.[2] Numerous indications accordingly point to a corresponding primitive zodiac. Setting aside as doubtful evidence derived from interpretations of cuneiform inscriptions, we meet, in connection with Mithraic and Mylittic legends, reminiscences of a zodiac and religious calendar in which the Bull led the way.[3] Virgil's

> Candidus auratis aperit cum cornibus annum
> Taurus

perpetuates the tradition. And we shall see presently that the Pleiades, not only were originally, but continued to be until well within historical memory, the first asterism of the *lunar* zodiac.

In the Chaldæan signs fragments of several distinct strata of thought appear to be embedded. From one point of view, they shadow out the great epic of the destinies of the human race; again, the universal solar myth claims a share in them; hoary traditions were brought into *ex post facto* connection with them; or they served to commemorate simple meteorological and astronomical facts.

Second sign.

The first Babylonian month Nisan, dedicated to Anu and Bel, was that of "sacrifice"; and its association with the Ram as the chief primitive object of sacrifice is thus intelligible.[4] According to an alternative explanation, however, the heavenly Ram, placed as leader in front of the flock of the stars, merely embodied a spontaneous figure of the popular imagination. An antique persuasion, that the grand cycle of creation opened under the first sign, has been transmitted to modern cognizance by Dante (*Inf.*, i. 38). The human race, on the other hand, was supposed to have come into being under Taurus. The solar interpretation of the sign goes back to the far-off time when the year began with Taurus, and the sun was conceived of as a bull entering upon the great furrow of heaven as he ploughed his way among the stars. In the third month and sign the building of the first city and the fratricidal brothers—the Romulus and Remus of Roman legend—were brought to mind. The appropriate symbol was at first indifferently a pile of bricks or two male children, always on early monuments placed feet to feet. The retrograde movement of a crab typified, by an easy association of ideas, the retreat of the sun from his farthest northern excursion, and Cancer was constituted the sign of the summer solstice. The Lion, as the symbol of fire, represented the culmination of the solar heat. In the sixth month, the descent of Ishtar to Hades in search of her lost husband Tammuz was celebrated, and the sign of the Virgin had thus a purely mythological signification.

Third to sixth sign.

Seventh and eighth signs.

The history of the seventh sign is somewhat complicated. The earlier Greek writers,—Eudoxus, Eratosthenes, Hipparchus,—knew of only eleven zodiacal symbols, but made one do double duty, extending the Scorpion across the seventh and eighth divisions. The Balance, obviously indicating the equality of day and night, is first mentioned as the sign of the autumnal equinox by Geminus and Varro, and obtained, through Sosigenes of Alexandria, official recognition in the Julian calendar. Nevertheless, Virgil (*Georg.*, i. 32) regarded the space it presided over as so much waste land, provisionally occupied by the "Claws" of the Scorpion, but readily available for the apotheosis of Augustus. Libra was not of Greek invention. Ptolemy, who himself chiefly used the "Claws" (Χηλαί), speaks of it as a distinctively Chaldæan sign;[5] and it occurs as an extra-zodiacal asterism in the Chinese sphere. An ancient Chinese law, moreover, prescribed the regularization of weights and measures at the *spring* equinox.[6] No representation of the seventh sign has yet been discovered on any Euphratean monument; but it is noticeable that the eighth is frequently doubled,[7] and it is difficult to avoid seeing in the pair of zodiacal scorpions carved on Assyrian cylinders the prototype of the Greek scorpion and claws. Both Libra and the sign it eventually superseded thus owned a Chaldæan birthplace. The struggle of rival systems of nomenclature, from which our zodiacal series resulted, is plainly visible in their alternations; and the claims of the competing signs were long sought to be conciliated by representing the Balance as held between the claws of the Scorpion.

Ninth to twelfth sign.

The definitive decline of the sun's power after the autumnal equinox was typified by placing a Scorpion as the symbol of darkness in the eighth sign. Sagittarius, figured later as a Centaur, stood for the Babylonian Mars. Capricornus, the sign of the winter solstice, is plausibly connected with the caprine nurse of the young solar god in Oriental legends, of which that of Zeus and Amalthea is a variant.[8] The fish-tailed Goat of the zodiac presents a close analogy with the Mexican calendar sign Cipactli, a kind of marine monster resembling a narwhal.[9] Aquarius is a still more exclusively meteorological sign than Leo. The eleventh month was known in Euphratean regions as that of "want and rain." The deluge was traditionally associated with it. It was represented in zodiacal symbolism by the god Ramman, crowned with a tiara and pouring water from a vase, or more generally by the vase and water without the god. The resumption of agricultural labors after the deluge was commemorated in the twelfth month, and a mystical association of the fishes, which were its sign,

[1] Lenormant, *Origines de l'Histoire*, vol. i. p. 236.

[2] The possibility should not, however, be overlooked that the "stars of the months" were determined by their heliacal risings (see Bosanquet and Sayce on Babylonian astronomy, in *Monthly Notices Roy. Astr. Soc.*, vol. xl. p. 117). This would give a further extension backwards of over 1000 years, during which the equinox might have occurred in the month of the Ram.

with the life after death is evident in a monument of Assyrian origin described by M. Clermont-Ganneau, showing a corpse guarded by a pair of fish-gods.[1] The doubling of the sign of Pisces still recalls, according to Mr. Sayce,[2] the arrangement of the Babylonian calendar, in which a year of 360 days was supplemented once in six years by a thirteenth month, a second Adar. To the double month corresponded the double sign of the "Fishes of Hea."[3]

Cyclical meaning of the succession of signs.

The cyclical meaning of the succession of zodiacal signs, though now obscured by interpolations and substitutions, was probably once clear and entire. It is curiously reflected in the adventures of the Babylonian Hercules, the solar hero Izdubar.[4] They were recorded in the comparatively late surviving version of the 7th century B.C., on twelve tablets, with an obvious design of correlation with the twelve divisions of the sun's annual course. Izdubar's conquest of the winged bull Heabani was placed under Taurus; his slaying of the tyrant Houmbaba (the prototype of Geryon) in the fifth month typified the victory of light over darkness, represented in plastic art by the group of a lion killing a bull, which is the form ordinarily given to the sign Leo on Ninevite cylinders.[5] The wooing of Ishtar by the hero of the epic falls under Virgo, and his encounter with two scorpion men, guardians of the rising and the setting sun, under Scorpio. The eleventh tablet narrates the deluge; the twelfth associates the apotheosis of Heabani (the Babylonian Chiron) with the zodiacal emblems of the resurrection.

The constellations.

In the formation of the constellations of the zodiac very little regard was paid to stellar configuration. The Chaldæans chose three stars in each sign to be the "councillor gods" of the planets.[6] These were called by the Greeks "decans," because ten degrees of the ecliptic and ten days of the year were presided over by each. The college of the decans was conceived as moving, by their annual risings and settings, in an "eternal circuit" between the infernal and supernal regions. Our modern asterisms first appear in the *Phænomena* of Eudoxus about 370 B.C. But Eudoxus, there is reason to believe, consulted, not the heavens, but a celestial globe of an anterior epoch, on which the stars and the signs were forced into unnatural agreement. The representation thus handed down to us (in the verses of Aratus) has been thought to tally best with the state of the sky about 2000 B.C.;[7] and the mention of a pole-star, for which Eudoxus was rebuked by Hipparchus, seems, as Mr. W. T. Lynn has pointed out,[8] to refer to the time when *a* Draconis stood near the pole. The data afforded by Eudoxus, however, are far too vague to serve as the basis of any chronological conclusion.

Egyptian zodiacal signs.

The Egyptians adopted from the Greeks, with considerable modifications of its attendant symbolism, the twelve-fold division of the zodiac. Aries became the Fleece; two Sprouting Plants, typifying equality or resemblance, stood for Gemini; Cancer was re-named Scarabæus; Leo was converted, from the axe-like configuration of its chief stars, into the Knife; Libra into the Mountain of the Sun, a reminiscence, apparently, of the Euphratean association of the seventh month with a "holy mound," designating the Biblical tower of Babel. A Serpent was the Egyptian equivalent of Scorpio; the Arrow only of Sagittarius was retained; Capricornus became "Life," or a Mirror as an image of life; Aquarius survived as Water; Taurus, Virgo, and Pisces remained unchanged.[9] The motive of some of the substitutions was to avoid the confusion which must have ensued from the duplication of previously existing native asterisms; thus, the Egyptian and Greek Lions were composed of totally different stars. Abstractions in other cases replaced concrete objects, with the general result of effacing the distinctive character of the Greek zodiac as a "circle of living things."

Spread of Greek system.

Early Zoroastrian writings, though impregnated with star-worship, show no traces of an attempt to organize the heavenly array. In the *Bundehish*, however (9th century), the twelve "Akhtârs," designated by the same names as our signs, lead the army of Ormuzd, while the seven "Awakhtârs" or planets (including a meteor and a comet) fight for Ahriman. The knowledge of the solar zodiac thus turned to account for dualistic purposes was undoubtedly derived from the Greeks. By them, too, it was introduced into Hindustan. Âryabhaṭa, about the beginning of our era, reckoned by the same signs as Hipparchus. They were transmitted from India by Buddhist missionaries to China, but remained in abeyance until the Jesuit reform of Chinese astronomy in the 17th century.

Chinese series of signs.

The native zodiacal system was of unexampled complexity. Besides divisions into twenty-eight and twenty-four parts, it included two distinct duodenary series. The *tse* or "stations" were referred by Biot to the date 1111 B.C. Measured from the winter solstice of that epoch, they corresponded, in conformity with the Chinese method of observation by intervals of what we now call right ascension, to equal portions of the celestial equator.[10] Projected upon the ecliptic, these were, of course, considerably unequal, and the *tse* accordingly differed essentially from the Chaldæan and Greek signs. Their use was chiefly astrological, and their highly figurative names—"Great Splendor," "Immense Void," "Fire of the Phœnix," etc.—had reference to no particular stars. They became virtually merged in the European series, stamped with official recognition upwards of two centuries ago. The twenty-four *tsieki* or demi-*tse* were probably invented to mark the course of weather changes throughout the year. Their appellations are purely meteorological.

The characteristic Chinese mode of dividing the "yellow road" of the sun was, however, by the twelve "cyclical animals,"—Rat, Ox, Tiger, Hare, Dragon or Crocodile, Serpent, Horse, Sheep, Monkey, Hen, Dog, Pig. The opening sign corresponds to our Aquarius, and it is remarkable that the rat is, in the far East, frequently used as an ideograph for "water." But here the agreement ceases. For the Chinese series has the strange peculiarity of proceeding in a retrograde direction or *against* the course of the sun. Thus, the second sign (of the Ox) occupies the position of Capricorn, the third that of Sagittarius, and so on. The explanation of this seeming anomaly is to be found in the primitive destination of the "animals" to the purposes of an "horary zodiac." Their succession, established to mark the hours of day and night, was not unnaturally associated with the diurnal revolution of the sphere from east to west.[11] They are unquestionably of native origin. Tradition ascribes their invention to Tajao, minister of the emperor Hwang-te, who reigned *c.* 2697 B.C., and it can scarcely be placed later than the 7th century B.C.[12]

The Chinese circle of the "animals" obtained early a wide diffusion. It was adopted by Tartars, Turks, and Mongols, in Tibet and Tong-king, Japan and Corea. It is denominated by Humboldt[13] the "zodiac

of hunters and shepherds," and he adds that the presence in it of a tiger gives it an exclusively Asiatic character. It appears never to have been designed for astronomical employment. From the first it served to characterize the divisions of time. The nomenclature not only of the hours of the day and of their minutest intervals was supplied by it, but of the months of the year, of the years in the Oriental sixty-year cycle, and of the days in the "little cycle" of twelve days. Nor has it yet fallen into desuetude. Years "of the Rat," "of the Tiger," "of the Pig," still figure in the almanacs of Central Asia, Cochin China, and Japan.

Aztec signs.

A large detachment of the "cyclical animals" even found its way to the New World. Seven of the twenty days constituting the Aztec month bore names evidently borrowed from those of the Chinese horary signs. The Hare (or Rabbit), Monkey, Dog, and Serpent reappeared without change; for the Tiger, Crocodile, and Hen, unknown in America, the Ocelot, Lizard, and Eagle were substituted as analogous.[1] The Aztec calendar dated from the 7th century; but the zodiacal tradition embodied by it was doubtless much more ancient. Of the zodiac in its true sense of a partitioned belt of the sphere there was no aboriginal knowledge on the American continent. Mexican acquaintance with the signs related only to their secondary function as dies (so to speak) with which to stamp recurring intervals of time.

Lunar zodiac.

The *synodical* revolution of the moon laid down the lines of the solar, its *sidereal* revolution those of the lunar zodiac. The first was a circlet of "full moons"; the second marked the diurnal stages of the lunar progress round the sky, from and back again to any selected star. The moon was the earliest "measurer" both of time and space; but its services can scarcely have been rendered available until stellar "milestones" were established at suitable points along its path. Such were the Hindu *nakshatras*, a word originally signifying stars in general, but appropriated to designate certain small stellar groups marking the divisions of the lunar track. They exhibit in an exaggerated form the irregularities of distribution visible in our zodiacal constellations, and present the further anomaly of being frequently reckoned as twenty-eight in number, while the ecliptical arcs they characterize are invariably twenty-seven. Now, since the moon revolves round the earth in $27\frac{1}{3}$ days, hesitation between the two full numbers might easily arise; yet the real explanation of the difficulty appears to be different. The superfluous asterism, named *Abhijit*, included the bright star α Lyræ, under whose influence the gods had vanquished the Asuras. Its invocation with the other *nakshatras*, remoteness from the ecliptic notwithstanding, was thus due (according to Prof. Max Müller's plausible conjecture)[2] to its being regarded as of especially good omen. Acquaintance with foreign systems of twenty-eight lunar divisions tended doubtless to fix its position, which remained, nevertheless, always equivocal.[3] Alternately admitted into or rejected from the series, it was finally, some six or seven centuries ago, eliminated by the effects of precession in reversing the order of culmination of its limiting stars.

Hindu system of *nakshatras*.

The notion of a twenty-seven-fold division of the zodiac was deeply rooted in Hindu tradition. The number and the name were in early times almost synonymous. Thus, a *nakshatra-mālā* denoted a necklace of twenty-seven pearls;[4] and the fundamental equality of the parts was figured in an ancient legend, by the compulsion laid upon King Soma (the Moon) to share his time impartially between all his wives, the twenty-seven daughters of Prajápati. Everything points to a native origin for the system of *nakshatras*. Some were named after exclusively Vedic deities; they formed the basis of the sacrificial calendar of the Brahmans; the old Indian names of the months were derived from them; their existence was presupposed in the entire structure of Hindu ritual and science.[5] They do not, however, obtain full recognition in Sanskrit literature until the Brāhmana period (7th or 8th century B.C.). The *Rig-Veda* contains only one allusion to them, where it is said that "Soma is placed in the lap of the *nakshatras*"; and this is in a part including later interpolations.

Positive proof of the high antiquity of the Hindu lunar zodiac is nevertheless afforded by the undoubted fact that the primitive series opened with Krittikā (the Pleiades) as the sign of the vernal equinox. The arrangement would have been correct about 2300 B.C.; it would scarcely have been possible after 1800 B.C.[6] We find nowhere else a well-authenticated zodiacal sequence corresponding to so early a date. The reform by which Krittikā, now relegated to the third place, was superseded as the head of the series by "Açvini"[7] was accomplished under Greek influence somewhere near the beginning of our era. For purposes of ritual, however, the Pleiades, with Agni or "Fire" as their presiding deity, continued to be the first sign. Hindu astronomy received its first definite organization in the 6th century, with results embodied in the *Sūrya-Siddhānta*. Here the "signs" and the "constellations" of the lunar zodiac form two essentially distinct systems. The ecliptic is divided into twenty-seven equal parts, called *bhogas* or arcs, of 800′ each. But the *nakshatras* are twenty-eight, and are represented by as many "junction stars" (*yogātāra*), carefully determined by their spherical co-ordinates. The successive entries of the moon and planets into the *nakshatras* (the ascertainment of which was of great astrological importance) were fixed by means of their conjunctions with the *yogātāras*. These, however, soon ceased to be observed, and already in the 11th century Al-Bīrūnī could meet with no Hindu astronomer capable of pointing out to him the complete series. Their successful identification by Colebrooke[8] in 1807 had a purely archæological interest. The modern *nakshatras* are twenty-seven equal ecliptical divisions, the origin of which shifts, like that of the solar signs, with the vernal equinox. They are, in fact, the *bhogas* of the *Sūrya-Siddhānta*. The mean place of the moon in them, published in all Hindu almanacs, is found to serve unexceptionally the ends of astral vaticination.[9]

The system upon which it is founded is of great antiquity. Belief in the power of the *nakshatras* evidently inspired the invocations of them in the *Atharva-Veda*. In the Brāhmana period they were distinguished as "deva" and "yama," the fourteen lucky asterisms being probably associated with the waxing, the fourteen unlucky with the waning moon.[10] A special *nakshatra* was appropriated to every occurrence of life. One was propitious to marriage, another to entrance upon school-life, a third to the first ploughing, a fourth to laying the foundation of a house. Festivals for the dead were appointed to be held under those that included but one star. Propitiatory abstinences were recommended when the natal asterism was menaced by unfavorable planetary conjunctions. The various members of the body were parcelled out among the *nakshatras*, and a rotation of food was prescribed

as a wholesome accompaniment of the moon's revolution among them.[1]

Nomenclature of Hindu signs.

The nomenclature of the Hindu signs of the zodiac, save as regards a few standard asterisms, such as Açvini and Krittikā, was far from uniform. Considerable discrepancies occur in the lists given by different authorities.[2] Hence it is not surprising to meet in them evidence of foreign communications. Reminiscences of the Greek signs of Gemini, Leo, Libra, Sagittarius, Capricornus, and Pisces are obvious severally in the Hindu Two Faces, Lion's Tail, Beam of a Balance, Arrow, Gazelle's Head (figured as a marine nondescript), and Fish. The correspondence does not, however, extend to the stars; and some coincidences adverted to by Humboldt between the *nakshatras* and the zodiacal animals of Central Asia are of the same nominal character.[3] Mexican loans are more remarkable. They were apparently direct as well as indirect.

Connections with other systems.

The Aztec calendar includes *nakshatra* titles borrowed, not only through the medium of the Tartar zodiac, but likewise straight from the Indian scheme, apart from any known intervention. The "three footprints of Vishnu," for example, unmistakably gave its name to the Mexican day Ollin, signifying the "track of the sun;" and both series further contain a "flint weapon," a "stick," and a "house."[4] Several houses and couches were ranged along the Hindu zodiac with the naive idea of providing resting-places for the wandering moon.

Relationship of a more intimate kind connects the Hindu lunar mansions with those of the Arabs and Chinese. The resemblance between the three systems is indeed so close that it has been assumed, almost as axiomatic, that they must have been framed from a single model; and the question of their origin has been debated with all the resources of varied erudition by scholars such as Biot, Weber, Whitney and Max Müller. As the upshot of the controversy it appears nevertheless to have become tolerably clear that the *nakshatras* were both native to India, and the *sieu* to China, but that the *manāzil* were mainly of Indian derivation. The assertion, paradoxical at first sight, that the twenty-eight "hostelries" of the Chinese sphere had nothing to do with the moon's daily motion seems to convey the actual fact. Their number, as a multiple of four, was prescribed by the quaternary partition of the heavens, fundamental in Chinese astronomy. It was considered by Biot to have been originally twenty-four, but to have been enlarged to twenty-eight about 1100 B.C., by the addition of determinants for the solstices and equinoxes of that period.[5] The essential difference, however, between the *nakshatras* and the *sieu* is that the latter were equatorial, not ecliptical, divisions. They were measured by the meridian-passages of the limiting stars, and varied in amplitude from 2° 42′ to 30° 24′.[6] The use of the specially observed stars constituting or representing the *sieu* was as points of reference for the movements of sun, moon, and planets. They served, in fact, and still serve (though with astrological ends in view), the precise purpose of "fundamental stars" in European astronomy. All that is certainly known about the antiquity of the *sieu* is that they were well established in the 3d century, B.C. Their initial point at the autumnal equinox marked by Kio (Spica Virginis) suits a still later date; and there is no valid evidence that the modern series resulted from the rectification of an older superannuated arrangement, analogous to the Krittikā sequence of *nakshatras*. The Hindu zodiacal constellations belong then to an earlier epoch than the Chinese "stations," such as they have been transmitted to our acquaintance. Yet not only were the latter an independent invention, but it is almost demonstrable that the *nakshatras*, in their more recent organization, were, as far as possible, assimilated to them. The whole system of junction stars was doubtless an imitation of the *sieu;* the choice of them by the Hindu astronomers of the 6th century A.D. was plainly instigated by a consideration of the Chinese list, compiled with a widely different intent. Where they varied from it, some intelligible reason can generally be assigned for the change. Eight junction stars lie quite close to, seven others are actually identical with Chinese determinants;[7] and many of these coincidences are between insignificant and, for the purposes of ecliptical division, inconveniently situated objects.

Relative antiquity of Hindu, Chinese, and Arabian systems.

Chinese asterisms or stations.

The small stellar groups characterizing the Arab "mansions of the moon" (*manāzil al-kamār*) were more equably distributed than either the Hindu or Chinese series. They presented, nevertheless, striking resemblances to both. Twenty-four out of twenty-eight were formed, at least in part, of *nakshatra* or *sieu* stars.[8] That the Arab was essentially a copy of the Hindu lunar zodiac can scarcely admit of a doubt. They were divided on the same principle; each opened at the spring equinox; the first Arab sign Sharatān was strictly equivalent to the Hindu Açvini; and eighteen constellations in each were virtually coincident. The model of the *sieu* was, however, also regarded. Eighteen Chinese determinants were included in the Arab asterisms, and of these five or six were not *nakshatra* stars; consequently, they must have been taken directly from the Chinese series. Nor were the Greek signs without effect in determining the names of the *manāzil*,[9] the late appearance of which, in a complete form, removes all difficulty in accounting for the various foreign influences brought to bear upon them. They were first enumerated by Alfarghāni early in the 9th century, when the Arabs were in astronomy the avowed disciples of the Hindus. But, although they then received perhaps their earliest quasi scientific organization, the mansions of the moon had for ages previously figured in the popular lore of the Bedouin. A set of twenty-eight rhymes associated their heliacal risings with the changes of season and the vicissitudes of nomad life; their settings were of meteorological and astrological import;[10] in the Koran (x. 5) they are regarded as indispensable for the reckoning of time. Yet even this intimate penetration into the modes of thought of the desert may be explained by prehistoric Indian communication. The alternative view, advocated by Weber, that the lunar zodiac was primitively Chaldæan, rests on a very shadowy foundation. It is true that a word radically identical with *manāzil* occurs twice in the Bible, under the forms *mazzaloth* and *mazzaroth* (2 Kings xxiii. 5; Job xxxviii. 32); but the heavenly halting places which it seems to designate may be solar rather than lunar. Euphratean exploration has so far brought to light no traces of ecliptical partition by the moon's diurnal motion, unless, indeed, zodiacal associations be claimed for a set of twenty-eight deprecatory formulæ against evil spirits inscribed on a Ninevite tablet.[11]

Arabian mansions of the moon.

The safest general conclusions regarding this disputed subject appear to be that the *sieu*, distinctively and unvaryingly Chinese, cannot properly be described as divisions of a lunar zodiac, that the *nakshatras*, though of purely Indian origin, became modified by the successive adoption of Greek and Chinese rectifications and supposed improvements; while the *manāzil*

constituted a frankly eclectic system, in which elements from all quarters were combined. It was adopted by Turks, Tartars, and Persians, and forms part of the astronomical paraphernalia of the *Bundehish*. The *sieu*, on the other hand, were early naturalized in Japan.

Astrological prediction.

The refined system of astrological prediction based upon the solar zodiac was invented in Chaldæa, obtained a second home and added elaborations in Egypt, and spread irresistibly westward about the beginning of our era. For genethliacal purposes the signs were divided into six solar and six lunar, the former counted onward from Leo, the "house" of the sun, the latter backward from the moon's domicile in Cancer. Each planet had two houses—a solar and a luuar—distributed accordiug to the order of their revolutions. Thus Mercury, as the planet nearest the sun, obtained Virgo, the sign adjacent to Leo, with the corresponding lunar house iu Gemini; Venus had Libra (solar) and Taurus (lunar); and so for the rest. A ram frequently stamped on coins of Antiochus, with head reverted towards the moon and a star (the planet Mars), signified Aries to be the lunar house of Mars. With the respective and relative positions iu the zodiac of the sun, moon, and planets, the character of their action on human destiny varied indefinitely. The influence of the signs, though secondary, was hence overmastering: Julian called them θεῶν δυνάμεις,[1] and they were the objects of a corresponding veneration. Cities and kingdoms were allotted to their several patronage on a system fully expounded by Manilius:

Astrological influence of signs.

> Hos erit in fines orbis pontusque notandus,
> Quem Deus in partes per singula dividit astra,
> Ac sua euique dedit tutelæ regna per orbem,
> Et proprias gentes atque urbes addidit altas,
> In quibus exercent præstantia sidera vires.[2]

Syria was assigned to Aries, and Syrian coins frequently bear the effigy of a ram; Scythia and Arabia fell to Taurus; India to Gemini. Palmyra, judging from numismatic evidence, claimed the favor of Libra, Zengma that of Capricorn; Leo protected Miletus, Sagittarius Singara.[3] The "power of the signs" was similarly distributed among the parts of the human body:

> Et quanquam communis eat tutela per omne
> Corpus, et in proprium divisis artubus exit:
> Namque aries capiti, taurus cervicibus hæret:
> Brachia sub geminis censentur, pectora cancro.[4]

Warnings were uttered against surgical treatment of a member through whose sign the moon happened to be passing;[5] and zodiacal anatomy was an indispensable branch of the healing art in the Middle Ages. Some curious memorials of the superstition have survived in rings and amulets, engraven with the various signs, and worn as a kind of astral defensive armor. Many such, of the 14th and 15th centuries, have been recovered from the Thames.[6] Individuals, too, adopted zodiacal emblems. Capricornus was impressed upon the coins of Augustus, Libra on those of Pythodoris, queen of Pontus; a sultan of Iconium displayed Leo as his "horoscope," and mark of sovereignty; Stephen of England chose the protection of Sagittarius.

Egyptian astrology.

In Egypt celestial influences were considered as emanating mainly from the thirty-six "decans" of the signs. They were called the "media of the whole circle of the zodiac;"[7] each ten-day period of the Egyptian year was consecrated to the decanal god whose section of the ecliptic rose at its commencement; the body was correspondingly apportioned, and disease was cured by invoking the zodiacal regent of the part affected.[8] As early as the 14th century B.C. a complete list of the decans was placed among the hieroglyphs adorning the tomb of Sethos I.; they figured again in the temple of Rameses II.,[9] and characterize every Egyptian astrological monument. Both the famous zodiacs of Dendera display their symbols, unmistakably indentified by Lepsius. The late origin of these interesting representations was established by the detection upon them of the cartouches of Tiberius and Nero. As the date of inception of the circular one now at Paris the year 46 B.C. has, however, been suggested with high probability, from (among other indications) the position among the signs of the emblem of the planet Jupiter.[10] Its design was most likely to serve as a sort of *thema cœli* at the time of the birth of Cæsarion. The companion rectangular zodiac still *in situ* on the portico of the temple of Isis at Dendera suits, as to constellational arrangements, the date 29 A.D. It set forth there is reason to believe, the natal scheme, not of the emperor Tiberius, as had been conjectured by Lauth,[11] but of the building it served to decorate. The Greek signs of the zodiac, including Libra, are obvious upon both these monuments, which have thrown some useful light upon the calendar system and method of stellar grouping of the ancient Egyptians.[12]

Planispheres.

An Egypto-Greek planisphere, first described by Bianchiui,[13] resembles in its general plan the circular zodiac of Dendera. The decans are ranged on the outermost of its five concentric zones; the planets and the Greek zodiac in duplicate occupy the next three; while the inner circle is unaccountably reserved for the Chinese cyclical animals. The relic was dug up on the Aventine in 1705, and is now in the Louvre. It dates from the 2d or 3d century of our era. The Tartar zodiac is not unfrequently found engraven on Chinese mirrors in polished bronze or steel of the 7th century, and figured on the "plateau of the twelve hours" in the treasury of the emperors of the Tang dynasty.[14]

Probably the most ancient zodiacal representation in existence is a fragment of a Chaldæan planisphere in the British Museum, once inscribed with the names of the twelve months and their governing signs. Two only now remain.[15] A zodiac on the "astrological altar of Gabies" in the Louvre illustrates the apportionment of the signs among the inmates of the Roman Pantheon;[16] and they occur as a classical reminiscence in the mosaic pavements of San Miniato and the baptistery at Florence, the cathedral of Lyons, and the crypt of San Savino at Piacenza.[17] Zodiacal symbolism became conspicuous in mediæval art. Nearly all the French cathedrals of the 12th and 13th centuries exhibit on their portals a species of rural calendar, in which each month and sign has its corresponding labor. The zodiac of Notre Dame of Paris, opening with Aquarius is a noted instance.[18] A similar series, in which sculptured figures of Christ and the Apostles are associated with the signs, is to be seen in perfect preservation on the chief doorway of the abbey church at Vézelay. The cathedrals of Amiens, Sens, and Rheims are decorated in the same way. In Italy the signs and works survive fragmentarily in the baptistery at Parma, completely on the porch of the cathedral of Cremona and on the west doorway of St. Mark's at Venice. They are less common in England; but St. Margaret's, York, and the church of Iffley in Oxfordshire offer good specimens. In the zodiac of Merton College, Oxford, Libra is represented by a judge in his robes and Pisces by the dolphin of Fitzjames, warden of the college, 1482–1507.[19] The great rose-windows of the Early Gothic period were frequently painted with zodiacal emblems; and some frescos in the cathedral of Cologne contain the signs, each with an attendant angel, just as they were depicted on the vault of the church at Mount Athos. Giotto's zodiac at Padua was remarkable (in its undisturbed condition) for the arrangement of the signs so as to be struck in turns, during the corresponding months, by the sun's rays.[20] The "zodiac of labors" was replaced in French castles and hôtels by a "zodiac of pleasures," in which hunting, hawking, fishing, and dancing were substituted for hoeing, planting, reaping, and ploughing.[21]

Zodiacal symbols in architecture.

It is curious to find the same sequence of symbols employed for the same decorative purposes in India as in Europe. A perfect set of signs was copied in 1764 from a pagoda at Verdapettah near Cape Comorin, and one equally

complete existed at the same period on the ceiling of a temple near Mindurah.[1]

Zodiacal hieroglyphs.

The hieroglyphs representing the signs of the zodiac in astronomical works are of late introduction. They are found in manuscripts of about the 10th century, but in carvings not until the 15th or 16th.[2] Their origin is unknown; but some, if not all of them, have antique associations. The hieroglyph of Leo, for instance, occurs amoug the symbols of the Mithraic worship.[3] (A. M. C.)

ZODIACAL LIGHT. The zodiacal light is usually described as a cone or lenticularly-shaped glow of nebulous light, seen after sunset or before sunrise, extending upwards from the position of the sun nearly in the direction of the ecliptic or of the sun's equator. This description, though fairly correct for the higher latitudes, does not represent accurately what is seen in the tropics, where the light is often a very conspicuous object. There, if an observer on a clear, moonless night watches the western sky from soon after sunset till the last trace of twilight has disappeared, he will notice that the twilight seems to linger longer near where the sun sank below the horizon, and that gradually a nebulous whitish band of light, broad towards the horizon and narrowing first rapidly and then more slowly upwards, begins to stand out clearly from the vanishing twilight, which spreads along a much wider and nearly horizontally-topped arc of the horizon. This is the zodiacal light. When seen on a perfectly clear night, it will be noticed that it fades imperceptibly on both borders and towards the vertex, and that its light is distinctly brighter towards the base than at greater altitudes. Its width and brightness, and the height of the vertex, differ very much from time to time, partly on account of actual variations, but much more from differences in the transparency of the atmosphere. In England it is seldom observed except in the months of March, April, and May shortly after sunset, or about October before sunrise. This is due to no change in the light itself, but simply to the circumstance that at other seasons the ecliptic makes so small an angle with the horizon that a light lying in or near it does not rise sufficiently high above the mists of the horizon to be seen after the twilight has vanished. In lower latitudes, where the angle made with the horizon is greater, while the duration of twilight is shorter, it can be easily seen at all seasons when there is a clear sky and no moon, except when Venus is an evening star, in which case the great brightness of that planet often almost completely obliterates the comparatively faint zodiacal light, at least in its neighborhood. The zodiacal light has frequently been described as having a reddish yellow tint; but this seems to be erroneous, for, when seen under favorable conditions, it is distinctly white and very similar to that of the Milky Way. Any color that may have been observed is doubtless due to atmospheric causes.

Among the Moslems, to whom it is important on ritual grounds to determine accurately the moment of daybreak, at which during Ramadan the daily fast begins, the morning zodiacal light appears to have been observed from an early period, and is known as the "false dawn" or the "wolf's tail" (Redhouse, in *Journ. R. A. S.*, July, 1878). But in Christian Europe it seems to have been first observed by Kepler, who described its appearance with considerable accuracy and came to the conclusion that it was the atmosphere of the sun. Descartes wrote about it in 1630 and Childrey in 1659; but the attention of astronomers was first prominently called to it by Dominic Cassini, who first saw it on 18th March, 1683. It is to him that it owes the name which it now bears. He explained it by supposing the existence of a flat luminous ring encircling the sun, nearly in the plane of his equator, and accounted for its disappearance on the same principle as that which accounts for the vanishing of Saturn's ring. Mairan (1731), like Kepler, ascribed the light to the sun's atmosphere; and this explanation was generally accepted, till Laplace showed that it was untenable, since no real solar atmosphere could extend to anything like the distance from the sun which is reached by the zodiacal light. He further showed that, even if the solar atmosphere did extend far enough, it would not have the lenticular appearance ascribed by observers to the zodiacal light, since the polar axis would be at least two-thirds of the equatorial axis. Since then many observers have made a study of the subject, amongst whom may be mentioned Jones, Piazzi Smyth, Jacob, Brorsen, Schmidt, Backhouse, Liais, and Wright.

Extent.—The way in which the light fades off gradually towards the boundaries makes it extremely difficult to determine accurately the true position of the light or its extent. Various observations show that at times the base, at an elongation of about 20°, may have a width of from 25° to 30°, while at an elongation of 60° the breadth is frequently as much as 20°, but usually much less. The distance of the vertex from the sun frequently exceeds 90°, and Mr. Liais and others have recorded cases when the light has been traced completely round from the western to the eastern horizon. This is very uncommon; but it is not at all rare to find the light stretching nearly to the meridian three hours after sunset, and several observers have recorded the existence of a bright patch of light almost opposite to the position of the sun. This is known as the *Gegenschein*, and though it has been seen comparatively seldom its existence must be accepted as proved; for its position has been determined by actual measurement by several astronomers, and their results agree with quite as great closeness as can be expected in the determination of the position of such an object. A lengthened series of observations was made on the zodiacal light by the Rev. G. Jones, chaplain of the United States steam frigate "Mississippi," in the China and Japan Seas in 1855. He charted the apparent position of the cone of light on a large number of nights and mornings, and came to the somewhat startling conclusion that his observations could be explained only by supposing the existence of a nebulous ring around the earth within the orbit of the moon. He recorded that twice near 23° 28′ N. lat., with the sun at the opposite solstice, he had seen "the extraordinary spectacle of the zodiacal light simultaneously at both the east and west horizons from 11 to 1 o'clock for several nights in succession." On reading this statement, Baron Humboldt communicated to the *Monatsberichte d. kön preuss. Akad. d. Wiss.* some unpublished observations of his own on a similar phenomenon. These were to the effect that on the 17th and 18th of March the light was very bright in the west, and "we constantly perceived in the east (and this is beyond doubt a very striking phenomenon) a whitish light which was also of a pyramidal form. The latter augmented the brightness of the sky in a very striking manner." The light in the west was so conspicuous that "even the sailors were delighted with this double light." He noted, too, what is a very important fact, that the two lights set at the same time; and there is much to be said in defence of his view that the eastern light was the reflection of the true zodiacal light in the west, just as the eastern sunset glows are the reflection of those in the west. The chief obstacle in the way of accepting this view is that it is difficult to believe that a light so faint as the zodiacal light could have a reflection bright enough to be seen, and even to be seen distinctly. On the other side must be set the circumstance that the simultaneous glow at both horizons seems never to have been observed from great altitudes. This is easily understood if the second glow is a mere reflection; whereas, if it comes from another source of light, it ought to be more conspicuous at high than at low levels.

Position.—The exact position of the axis of the zodiacal light relatively to the ecliptic has not yet been satisfactorily fixed. The extreme haziness of outline and the excessive faintness of the light near the vertex make it quite impossible to use a telescope for measuring its limits. Most observers have tried to fix its position by tracing its outline on a star chart, while Prof. C. Piazzi Smyth employed two sights mounted equatorially. But even by these means no great accuracy can be attained, for the limits of the light can be traced only when the eye is quite unfatigued and when the light is looked at with averted vision. The

[3] See Lajard, *Culte de Mithra*, pl. xxvii. Fig. 5, etc.

difficulty experienced is well illustrated by the wide divergencies between the results of different observers—divergencies not only in the extent of the light, which would be quite natural, but even in the direction of the axis of the cone. Thus, Captain Jacob, who observed in Madras in 1856–57–58, found that his evening observations placed the vertex of the western cone in from 2° S. lat. to 6° N. lat., with an average of about 3° N. lat. His morning observations were less numerous and gave positions for the vertex of the eastern cone varying from ½° N. to 8° S., with an average of about 2° S. Mr. Backhouse from 418 observations found a mean deviation from the ecliptic of 2.06°, while Captain Tupman, observing in the Mediterranean in August and September, found an inclination of no less than 20°. He also found that the plane of the light did not pass through the sun. His observations, however, differ somewhat widely from those of most other observers. Mr. A. Searle has made a very careful study of all the best published records. In his first paper more than 650 observations by Jones, Heis, Schmidt, and others are discussed, and he concludes that apparent changes in latitude are mainly, if not entirely, produced by the effect of atmospheric absorption, which affects the lower boundary more than the upper and to an extent depending on the inclination of the axis of the light to the horizon. In a second paper he discusses Jones's observations alone and comes to the conclusion that, after making allowance for the effects of absorption, there is some evidence that the zodiacal light, as seen during the second half of the 19th century, has had a more northern latitude near 180° long. than near 0° long. It seems somewhat doubtful, however, whether the observations hitherto made are sufficiently accurate to justify this conclusion, and all that can be confidently asserted is that the observations made so far point to such a difference as being probable. Similar variations in the greatest elongation, the breadth, and the brightness have been asserted to exist. Thus Mr. J. F. Julius Schmidt, as the result of several years' observations, finds a variation in the inclination of the axis of the cone of light to the ecliptic from 4° 18′ at the end of December to 0° towards the end of March, a similar variation in the greatest elongation from the sun from 120° in January to 70° in April, and a further similar variation in breadth at corresponding elongations, with a minimum for all three about 30th March. It may be pointed out that observations regarding the extent of the visible light are absolutely valueless unless accompanied by careful records of the clearness of the sky as evidenced by the visibility of faint objects, for all observers of the zodiacal light must have noticed that a thin film of mist, which hardly affects the color of the sky or the visibility of the brighter stars, may almost completely obliterate the zodiacal light. No accurate photometric observations seem to have been made on the strength of the light, and observers have differed widely in their estimates. Some assert that it is much brighter than the Milky Way, while others—and especially those who have observed in the tropics—say that it is seldom so bright as the brighter parts of the Milky Way. It is certainly often brighter than most of the Milky Way. Mr. Searle deduces from Sir W. Herschel's and Celoria's observations that the Milky Way is about 2 magnitudes brighter than the mean brightness of the sky, and says that on this estimate the brighter parts of the zodiacal light would be commonly 3 or 4 magnitudes brighter than the surrounding sky. This is almost certainly an over-estimate. There seems to be very little doubt that the brightness undergoes periodic fluctuations, but no estimate can as yet be made of the length of the period. It is probable that the brightness has been below the average for the last few years, but is now increasing. Most observers have also reported rapid changes of brightness, or undulations, such as are seen in the aurora and in the tails of some comets; but, as was pointed out by Olbers in 1833, these undulations must be produced in the earth's atmosphere. In this connection it may be mentioned that in observing the spectrum rapid flickerings, like waves moving along the spectrum, are often very marked.

The Moon's Zodiacal Light.—Several observers have recorded observations which appeared to show that the moon produced an appearance very similar to that of the zodiacal light. Piazzi Smyth, however, when observing on the Peak of Teneriffe, saw this appearance and showed by actual measurement that the glow seen before moonrise does not lie near the ecliptic, but is nearly vertical, and is due simply to refraction in the earth's atmosphere. This explanation will hardly account for an interesting observation made by Mr. L. Trouvelot, which if repeated would require to be very carefully investigated. On a night when the zodiacal light was very bright and there were magnetic disturbances followed by an auroral display, but when no aurora was actually visible, he saw a conical light rising obliquely from the top of the roof of a building behind which the moon, then about 15° or 20° above the horizon, was concealed. The axis of the light coincided nearly with the ecliptic, and the light could be traced on both sides of the moon, when the moon itself was concealed. The whole of the circumstances led Mr. Trouvelot to conclude that this light and the zodiacal light were phenomena of the same order, while this and other observations, he considered, rendered it probable that there was some connection between the zodiacal light and auroras.

Physical Constitution.—As has already been pointed out, it is impossible to see the zodiacal light through a telescope, and this, taken along with the extreme faintness of the light, renders it exceedingly difficult to examine it satisfactorily with either the polariscope or the spectroscope. Many attempts have been made to determine whether or not the light was to any extent polarized, but with questionable results until Prof. A. W. Wright attacked the problem, using a polariscope specially designed for studying very faint lights. With this he was enabled to determine with certainty that the light was partially polarized in a plane passing through the sun, and that the amount of polarization was most probably as much as 15 per cent., but less than 20 per cent. Many attempts have been made to observe the spectrum. In 1867 Ångström, observing at Upsala in March, obtained the bright aurora line (W. L. 5567), and concluded that in the zodiacal light there was the same material as is found in the aurora and in the solar corona, and probably through all space. Upsala, however, is a place where the aurora spectrum can often be observed in the sky even when no aurora is visible, and it has generally been believed that what Angström really saw was an auroral and not a zodiacal light spectrum. Señor A. T. Acrimiz, observing at Cadiz, obtained a continuous but faint spectrum with two bright lines—a yellowish line, probably an aurora line, and a line in the blue, more refrangible than F, which he could not identify, but which in all probability was another auroral line. The fact that he saw this spectrum with a five-prism spectroscope attached to an equatorial seems conclusive evidence that it was not the zodiacal light spectrum that he was observing. The most satisfactory observations hitherto published seem to be those of Prof. Piazzi Smyth and Prof. A. W. Wright. Both used spectroscopes specially designed for the examination of faint lights, and their results agree completely with each other. Prof. Smyth made his observations at Palermo and found a faint continuous spectrum extending from about W. L. 5550 to W. L. 5000 (British inches scale), with a maximum brightness at about W. L. 5350. In fact, the light was almost exactly similar to that of faint diffused sunlight, such as is got in the last traces of twilight. Prof. Wright's conclusion was that the spectrum differs from that of sunlight only in intensity. Some recent unpublished observations made in the tropics indicate that, while the spectrum is usually that described by Prof. Smyth, there are times when a bright line is seen. Too much stress, however, must not be laid on this, as the observations are by no means conclusive, and the apparent line may in reality be only a part of the continuous spectrum which is brighter than usual.

The discussion of the real cause of the zodiacal light is rendered very difficult by the want of agreement in the observations that have been made upon it, and by the existence of a small number of apparently trustworthy observations of a very abnormal extension of the light, as detailed above; but certain conclusions may be safely arrived at. The theory that it is due to a ring of small bodies surrounding the earth seems to be entirely negatived, as pointed out by Proctor and others, by several of its features. The best observations leave no room for the parallactic displacement which would be observed if there were such a ring round the earth, and the absence of a large part of the luminous circle on ordinary occasions would be inexplicable on any such hypothesis. There can therefore be very little doubt that we must look for the

cause of the light to the existence of a mass of small bodies moving in orbits round the sun, and that, as shown by the polarization and the spectrum, the light is chiefly, if not entirely, reflected sunlight. To account for all the observations, Proctor has shown that the bodies must travel in orbits of considerable eccentricity, carrying them far beyond the limits of what we may term the zodiacal disk. Under these conditions the constitution of the disk would become variable within exceedingly wide limits, and all the recorded variations might be fairly explained. The appearance of a complete arch, as seen by Liais and others, would indicate an extension far beyond the earth's orbit; but at present at least, this must be looked on as very exceptional. The spectroscopic evidence, so far as it goes, confirms this theory, since it indicates that the light is mainly reflected sunlight; and, even if further observations should confirm the opinion that bright lines are sometimes present, this need in no way invalidate the conclusions that have been arrived at. Indeed, it seems highly probable—especially if Mr. Lockyer's views regarding meteorites are confirmed—that bright lines should be seen in such a body of meteorites. Olbers long ago suggested that the corona was the brightest part of the zodiacal light, and there is nothing in recent observations to contradict this view, for all observations go to show that the outer corona has no definite boundary, but shades off imperceptibly and becomes invisible at a great distance from the sun. Dr. Huggins, while holding that the corona is most probably due to the ceaseless outflow of extremely minute particles from the sun, thinks it not improbable that the zodiacal light may be in some way connected with this outflow. Dr. Siemens, when discussing his theory of the conservation of solar energy, sought for an explanation of the zodiacal light in the dust which he supposed to be ejected from equatorial regions, rendered luminous partly by reflected sunlight partly by phosphorescence, and partly by electrical action.

With the increasing number of observatories at high altitudes it may fairly be hoped that before long astronomers will be put in possession of such definite measurements as will enable some at least of the points still under discussion to be finally settled, and that far more accurate observations will soon be available on which to construct a satisfactory theory.

ZOHAR. See Kabbalah.

ZÖLLNER, Johann Carl Friedrich (1834–1882), astronomer and physicist, was born at Berlin on 8th November, 1834. From 1872 he held the chair of astro-physics at Leipsic university. He is the author of numerous papers on photometry and spectrum analysis in *Poggendorff's Annalen* and *Berichte der k. sächsischen Gesellschaft der Wissenschaften*, of two works on astronomical photometry (*Grundzüge einer allgemeinen Photometrie des Himmels*, Berlin. 1861, 4to, and *Photometrische Untersuchungen*, Leipsic, 1865, 8vo), and of a very strange book, *Über die Natur der Cometen* (Leipsic, 1872, 8vo). He died at Leipsic on 25th April, 1882.

Zöllner's "astrophotometer" compares the light of a star as seen in a telescope with that of an artificial star produced by a paraffin lamp. From the latter the light passes through three Nicol's prisms, of which two can be turned so as to vary the intensity of the light, the latter being proportional to the square of the cosine of the angle through which the prisms are turned, which angle is read off on a small circle. In order to vary the color of the artificial star, so as to make it resemble the natural star as much as possible, there is inserted between the first and second prisms a plate of left-handed quartz, cut perpendicular to the axis, the rotation of which is read off on another circle. This instrument has been used by Zöllner, Lindemann, Engelmann, J. T. Wolff, and others for photometric observations of stars and planets; but it labors under several defects, among which the difficulty of keeping the flame of the lamp at a constant height is the most serious.

ZOMBOR, a royal free city of Hungary, the capital of the county of Bács-Bodrog, lies about 120 miles south of Budapest in a fertile plain, on the Francis Canal that connects the Danube and the Theiss. The town has some fine streets and squares, and several handsome buildings, among which may be mentioned the county and town halls, the theatre, and the Roman Catholic and Greek churches. Zombor is a station on the Alföld-Fiume Railway and the centre of the corn and cattle trade of an extensive area. The population numbered 24,693 in 1880 and about 31,000 in 1886.

ZONARAS, Joannes, historian and theologian, flourished at Constantinople in the 12th century. Under Alexius I. Comnenus he held the offices of commander of the bodyguard and private secretary to the emperor, but in the succeeding reign he retired to Mount Athos, where he spent the rest of his life in writing his books. He is said to have lived to the age of eighty-eight.

His most important work, the *Chronicon*, is in eighteen books, and extends from the creation of the world to the death of Alexius (1118). The earlier part is largely drawn from Josephus; for Roman history he chiefly followed Dion Cassius, whose first twenty books are only known to us through Zonaras. Of contemporary events which he himself witnessed he writes more briefly and meagrely than might have been expected. His history was continued by Nicetas Acominatus. Among the other works of Zonaras is an *Exposition of the Apostolical Canons*. The *Chronicon* or *Annals* was first printed at Basel in 1557; Du Cange next edited it in 1686; and it also forms part of the Bonn collection of Byzantine writers, having been edited by Pinder (2 vols.) in 1841–44. The latest edition is by Dindorf, with Du Cange's notes (6 vols. 8vo. Leipsic, 1868–75). The *Opera Omnia Historica, Canonica, Dogmatica*, were published by Migne in 2 vols. 4to. at Paris in 1865. A lexicon, also attributed to Zonaras, has been edited by Tittmann (Leipsic, 1808).

ZOOLOGY.

THE branch of science to which the name zoology is strictly applicable may be defined as that portion of biology which relates to animals, as distinguished from that portion which is concerned with plants.

The science of biology itself has been placed by Mr. Herbert Spencer in the group of concrete sciences, the other groups recognized by that writer being the "abstract-concrete" and the "abstract." The

abstract sciences are logic and mathematics, and treat of the blank forms in which phenomena occur in relation to time, space, and number. The abstract-concrete sciences are mechanics, physics, and chemistry. The title assigned to them is justified by the fact that, whilst their subject matter is found in a consideration of varied concrete phenomena, they do not aim at the explanation of complex concrete phenomena, as such, but at the determination of certain "abstract" quantitative relations and sequences known as the "laws" of mechanics, physics, and chemistry, which never are manifested in a pure form, but always are inferred by observation and experiment upon complex phenomena in which the abstract laws are disguised by their simultaneous interaction. The group of concrete sciences includes astronomy, geology, biology, and sociology. These sciences have for their aim to "explain" the concrete complex phenomena of (*a*) the sidereal system, (*b*) the earth as a whole, (*c*) the living matter on the earth's surface, (*d*) human society, by reference to the properties of matter set forth in the generalizations or laws of the abstract-concrete sciences, *i.e.*, of mechanics, physics, and chemistry.

Relation of biology to other sciences.

The classification thus sketched exhibits, whatever its practical demerits, the most important fact with regard to biology, namely, that it is the aim or business of those occupied with that branch of science to assign living things, in all their variety of form and activity, to the one set of forces recognized by the physicist and chemist. Just as the astronomer accounts for the heavenly bodies and their movements by the laws of motion and the property of attraction, as the geologist explains the present state of the earth's crust by the long-continued action of the same forces which at this moment are studied and treated in the form of "laws" by physicists and chemists, so the biologist seeks to explain in all its details the long process of the evolution of the innumerable forms of life now existing, or which have existed in the past, as a necessary outcome, an automatic product, of these same forces.

Science may be defined as the knowledge of causes; and, so long as biology was not a conscious attempt to ascertain the causes of living things, it could not be rightly grouped with other branches of science. For a very long period the two parallel divisions of biology, —botany and zoology,—were actually limited to the accumulation of observations, which were noted, tabulated, and contemplated by the students of these subjects with wonder and delight, but only to a limited extent and in restricted classes of facts with any hope or intention of connecting the phenomena observed with the great nexus of physical sequence or causation. A vague desire to assign the forms and the activities of living things in all their variety to general causes has always been present to thoughtful observers from the earliest times of which we have record, but the earlier attempts in this direction were fantastic in the extreme; and it is the mere truth that, at the time when the phenomena of inorganic nature had been recognized as the outcome of uniform and constant properties capable of analysis and measurement, living things were still left hopelessly out of the domain of explanation, the earlier theories having been rejected and nothing as yet suggested in their place.

Scope of the history of zoology.

The history of zoology as a science is therefore the history of the great biological doctrine of the evolution of living things by the natural selection of varieties in the struggle for existence,—since that doctrine is the one medium whereby all the phenomena of life, whether of form or function, are rendered capable of explanation by the laws of physics and chemistry, and so made the subject-matter of a true science or study of causes. A history of zoology must take account of the growth of those various kinds of information with regard to animal life which have been arrived at in past ages through the labors of a long series of ardent lovers of nature, who in each succeeding period have more and more carefully and accurately tested, proved, arranged, and tabulated their knowledge, until at last the accumulated lore of centuries—almost without the consciousness of its latest heirs and cultivators—took the form of the doctrine of descent and the filiation of the animal series.

History.

There is something almost pathetic in the childish wonder and delight with which mankind in its earlier phases of civilization gathered up and treasured stories of strange animals from distant lands or deep seas, such as are recorded in the *Physiologus*, in Albertus Magnus, and even at the present day in the popular treatises of Japan and China. That omnivorous universally credulous stage, which may be called the "legendary," was succeeded by the age of collectors and travellers, when many of the strange stories believed in were actually demonstrated as true by the living or preserved trophies brought to Europe by adventurous navigators. The possibility of verification established verification as a habit; and the collecting of *things*, instead of the accumulating of *reports*, developed a new faculty of minute observation. The early collectors of natural curiosities were the founders of zoological science, and to this day the naturalist-traveller and his correlative, the museum curator and systematist, play a most important part in the progress of zoology. Indeed, the historical and present importance of this aspect or branch of zoological science is so great that the name "zoology" has until recently been associated entirely with it, to the exclusion of the study of minute anatomical structure and function which have been distinguished as anatomy and physiology. It is a curious result of the steps of the historical progress of the two divisions of biological science that, whilst the word "botany" has always been understood, and is at the present day understood, as embracing the study, not only of the external forms of plants, their systematic nomenclature and classification, and their geographical distribution, but also the study of their minute structure, their organs of nutrition and reproduction, and the mode of action of the mechanism furnished by those organs, the word "zoology" has been limited to such a knowledge of animals as the travelling sportsman could acquire in making his collections of skins of beasts and birds, of dried insects and molluscs' shells, and such a knowledge as the museum curator could acquire by the examination and classification of these portable objects. Anatomy and the study of animal mechanism, animal physics, and animal chemistry, all of which form part of a true zoology, have been excluded from the usual definition of the word by the mere accident that the zoologist of the last three centuries has had his museum but has not had his garden of living specimens as the botanist has had;[1] and, whilst the zoologist has thus for a long time been deprived of the means of anatomical and physiological study—only supplied within the past century by the method of preserving animal bodies in alcohol—the demands of medicine for a knowledge of the structure of the human animal have in the meantime brought into existence a separate and special study of human anatomy and physiology.

Era of collectors and travellers.

From these special studies of human structure the knowledge of the anatomy of animals has proceeded,

[1] The mediæval attitude towards both plants and animals had no relation to real knowledge, but was part of a peculiar and in itself highly interesting mysticism. A fantastic and elaborate doctrine of symbolism existed which comprised all nature; witchcraft, alchemy, and medicine were its practical expressions. Animals as well as plants were regarded as "simples" and used in medicine, and a knowledge of them was valued from this point of view. Plants were collected and cultivated for medicinal use; hence the physic gardens and the botanist's advantage.

the same investigator who had made himself acquainted with the structure of the human body desiring to compare with the standard given by human anatomy the structures of other animals. Thus comparative anatomy came into existence as a branch of inquiry apart from zoology, and it is only now, in the latter part of the 19th century, that the limitation of the word "zoology" to a knowledge of animals which expressly excludes the consideration of their internal structure has been rejected by the general consent of those concerned in the progress of science; it is now generally recognized that it is mere tautology to speak of zoology *and* comparative anatomy, and that our museum naturalists must give attention as well to the inside as to the outside of animals.

Relation to anatomy and physiology.

The anatomy and physiology of plants have never been excluded from the attention of botanists, because in contrast to the earlier zoologists they always were in possession of the whole living plant, raised from seed if need be in a hot-house, instead of having only a dried skin, skeleton, or shell. Consequently the study of vegetable anatomy and physiology has grown up naturally and in a healthy way in strict relation to the rest of botanical knowledge, whilst animal anatomy and physiology have been external to zoology in origin, the product of the medical profession and, as a consequence, subjected to a misleading anthropocentric method.

Whilst we may consider the day as gone by in which zoology could be regarded as connoting solely a special museum knowledge of animals (as twenty-five years ago was still the case), it is interesting to observe by the way the curious usurpation of the word "physiology," which, from having a wide connotation, indicated by its etymology,—the *physiologus* of the Middle Ages being nothing more nor less than the naturalist or student of nature,—has in these later days acquired a limitation which it is difficult to justify or explain. Physiology to-day means the study of the physical and chemical properties of the animal or vegetable body, and is even distinguished from the study of structure and strictly confined to the study of function. It would hardly be in place here to discuss at length the steps by which physiology became thus limited, any more than to trace those by which the word "physician" and "physicist" (which both mean one who occupies himself with nature) came to signify respectively a medical practitioner and a student of the laws of mechanics, heat, light, and electricity (but not of chemistry), whilst the word "naturalist" is very usually limited to a lover and student of living things, to the exclusion of the so-called physicist, the chemist, and the astronomer. It is probable that physiology acquired its present significance, viz., the study of the properties and functions of the tissues and organs of living things, by a process of external attraction and spoliation which gradually removed from the original *physiologus* all his belongings and assigned them to newly named and independently constituted sciences, leaving at last, as a *residuum* to which the word might still be applied, that medical aspect of life which is concerned with the workings of the living organism regarded as a piece of physico-chemical apparatus.

Restricted use of the term physiology.

Whatever may be the history of the word "physiology," we find zoology, which really started in the 16th century with the awakening of the new spirit of observation and exploration, for a long time running a separate course uninfluenced by the progress of the medical studies of anatomy and physiology. The history of every branch of science involves a recognition of the history, not only of other branches of science, but of the progress of human society in every other relation. The century which destroyed the authority of the church, witnessed the discovery of the New World, and in England produced the writings of Francis Bacon is rightly regarded as the starting-point of the modern knowledge of natural causes or science. The true history of zoology as a science lies within the three last centuries; and, whilst the theories and fables which were current in earlier times in regard to animal life and the various kinds of animals form an important subject of study from the point of view of the history of the development of the human mind, they really have no bearing upon the history of scientific zoology. The great awakening of western Europe in the 16th century led to an active search for knowledge by means of observation and experiment, which found its natural home in the universities. Owing to the connection of medicine with these seats of learning, it was natural that the study of the structure and functions of the human body and of the animals nearest to man should take root there; the spirit of inquiry which now for the first time became general showed itself in the anatomical schools of the Italian universities of the 16th century, and spread fifty years later to Oxford.

Rise of scientific zoology.

In the 17th century the lovers of the new philosophy, the investigators of nature by means of observation and experiment, banded themselves into academies or societies for mutual support and intercourse. It is difficult to exaggerate the importance of the influence which has been exercised by these associations upon the progress of all branches of science and of zoology especially. The essential importance of academies is to be found, as Laplace, the great French astronomer, has said, "in the philosophic spirit which develops itself in them and spreads itself from them as centres over an entire nation and all relations. The isolated man of science can give himself up to dogmatism without restraint; he hears contradictions only from afar. But in a learned society the enunciation of dogmatic views leads rapidly to their destruction, and the desire of each member to convince the others necessarily leads to the agreement to admit nothing excepting what is the result of observation or of mathematical calculation."

Influence of academies and societies.

The first founded of surviving European academies, the Academia Naturæ Curiosorum (1651),[1] especially confined itself to the description and illustration of the structure of plants and animals; eleven years later (1662) the Royal Society of London was incorporated by royal charter, having existed without a name or fixed organization for seventeen years previously (from 1645). A little later the Academy of Sciences of Paris was established by Louis XIV. The influence of these great academies of the 17th century on the progress of zoology was precisely to effect that bringing together of the museum-men and the physicians or anatomists which was needed for further development. Whilst the race of collectors and systematizers culminated in the latter part of the 18th century in Linnæus, a new type of student made its appearance in such men as John Hunter and other anatomists, who, not satisfied with the superficial observations of the popular "zoologists," set themselves to work to examine anatomically the whole animal kingdom, and to classify its members by aid of the results of such profound study. From them we pass to the comparative anatomists of the 19th century and the introduction of the microscope as a serious instrument of accurate observation.

The influence of the scientific academies and the spirit in which they worked in the 17th century cannot be better illustrated than by an examination of the early records of the Royal Society of London. The spirit which animated the founders and leaders of that society is clearly indicated in its motto "Nullius in verba." Marvellous narrations were not permitted at the meetings of the society, but solely demonstrative experiments or the exhibition of actual specimens. Definite rules were laid down by the society for its

[1] The Academia Secretorum Naturæ was founded at Naples in 1560, but was suppressed by the ecclesiastical authorities.

guidance, designed to ensure the collection of solid facts and the testing of statements embodying novel or remarkable observations. Under the influence of the touchstone of strict inquiry set on foot by the Royal Society, the marvels of witchcraft, sympathetic powders, and other relics of mediæval superstition disappeared like a mist before the sun, whilst accurate observations and demonstrations of a host of new wonders accumulated, amongst which were numerous contributions to the anatomy of animals, and none perhaps more noteworthy than the observations, made by the aid of microscopes constructed by himself, of Leeuwenhoek, the Dutch naturalist (1683), some of whose instruments were presented by him to the society.

Results of use of the microscope.

It was not until the 19th century that the microscope thus early applied by Leeuwenhoek, Malpighi, Hook, and Swammerdam to the study of animal structure, was perfected as an instrument, and accomplished for zoology its final and most important service. The earlier half of the 19th century is remarkable for the rise, growth, and full development of a new current of thought in relation to living things, expressed in the various doctrines of development which were promulgated, whether in relation to the origin of individual animals and plants or in relation to their origin from predecessors in past ages. The perfecting of the microscope led to a full comprehension of the great doctrine of cell-structure and the establishment of the facts—(1) that all organisms are either single corpuscles (so-called cells) of living material (microscopic animalcules, etc., or are built up of an immense number of such units; (2) that all organisms begin their individual existence as a single unit or corpuscle of living substance, which multiplies by binary fission, the products growing in size and multiplying similarly by binary fission; and (3) that the life of a multicellular organism is the sum of the activities of the corpuscular units of which it consists, and that the processes of life must be studied in and their explanation obtained from an understanding of the chemical and physical changes which go on in each individual corpuscle or unit of living material or protoplasm (cell-theory of Schwann).

Ideas of development.

On the other hand, the astronomical theories of development of the solar system from a gaseous condition to its present form, put forward by Kant and by Laplace,[1] had impressed men's minds with the conception of a general movement of spontaneous progress or development in all nature; and, though such ideas were not new but are to be found in some of the ancient Greek philosophers, yet now for the first time they could be considered with a sufficient knowledge and certainty as to the facts, due to the careful observation of the two preceding centuries. The science of geology came into existence, and the whole panorama of successive stages of the earth's history, each with its distinct population of strange animals and plants, unlike those of the present day and simpler in proportion as they recede into the past, was revealed by Cuvier, Agassiz, and others. The history of the crust of the earth was explained by Lyell as due to a process of slow development, in order to effect which he called in no cataclysmic agencies, no mysterious forces differing from those operating at the present day. Thus he carried on the narrative of orderly development from the point at which it was left by Kant and Laplace,—explaining by reference to the ascertained laws of physics and chemistry the configuration of the earth, its mountains and seas, its igneous and its stratified rocks, just as the astronomers had explained by those same laws the evolution of the sun and planets from diffused gaseous matter of high temperature.

The suggestion that living things must also be included in this great development was obvious. They had been so included by poet-philosophers in past ages; they were so included by many a simple-minded student of nature who, watching the growth of the tree from the seed, formed a true but unverified inference in favor of a general process of growth and development of all things from simpler beginnings. The delay in the establishment of the doctrine of organic evolution was due, not to the ignorant and unobservant, but to the leaders of zoological and botanical science. Knowing as they did the almost endless complexity of organic structures, realizing as they did that man himself with all the mystery of his life and consciousness must be included in any explanation of the origin of living things, they preferred to regard living things as something apart from the rest of nature, specially cared for, specially created by a Divine Being, rather than to indulge in hypotheses which seemed to be beyond all possibility of proof, and were rather of the nature of poets' dreams than in accordance with the principles of that new philosophy of rigid adherence to fact and demonstration which had hitherto served as the mainsprings of scientific progress. Thus it was that the so-called "Natur-philosophen" of the last decade of the 18th century, and their successors in the first quarter of the 19th, found few adherents among the working zoologists and botanists. Lamarck, Treviranus, Erasmus Darwin, Goethe, and Saint-Hilaire preached to deaf ears, for they advanced the theory that living beings had developed by a slow process of transmutation in successive generations from simpler ancestors, and in the beginning from simplest formless matter, without being able to demonstrate any existing mechanical causes by which such development must necessarily be brought about. They were met in fact by the criticism that possibly such a development had taken place; but, as no one could show as a simple fact of observation that it *had* taken place, nor as a result of legitimate inference that it *must* have taken place, it was quite as likely that the past and present species of animals and plants had been separately created or individually brought into existence by unknown and inscrutable causes, and (it was held) the truly scientific man would refuse to occupy himself with such fancies, whilst ever continuing to concern himself with the observation and record of indisputable facts. The critics did well; for the "Natur-philosophen," though right in their main conception, were premature.

The Natur-philosophen.

It was reserved for Charles Darwin, in the year 1859, to place the whole theory of organic evolution on a new footing, and by his discovery of a mechanical cause actually existing and demonstrable by which organic evolution must be brought about to entirely change the attitude in regard to it of even the most rigid exponents of the scientific method. Since its first publication in 1859 the history of Darwin's theory has been one of continuous and decisive conquest, so that at the present day it is universally accepted as the central, all-embracing doctrine of zoological and botanical science.

Darwin's doctrine of organic evolution.

Darwin succeeded in establishing the doctrine of organic evolution by the introduction into the web of the zoological and botanical sciences of a new science. The subject-matter of this new science, or branch of biological science, had been neglected: it did not form part of the studies of the collector and systematist, nor was it a branch of anatomy, nor of the physiology pursued by medical men, nor again was it included in the field of microscopy and the cell-theory. The area of biological knowledge which Darwin was the first to subject to scientific method and to render, as it were, contributory to the great stream formed by the union of the

Introduction of thremmatology.

[1] [The nebular hypothesis was first propounded by the philosophers Swedenborg, Kant, and Laplace. See *Newcomb and Holden's Astronomy*, p. 492. Of these Swedenborg was the first to suggest the theory.—Am. Ed.]

various branches, the outlines of which we have already traced, is that which relates to the breeding of animals and plants, their congenital variations, and the transmission and perpetuation of those variations. This branch of biological science may be called thremmatology (*θρέμμα*, "a thing bred"). Outside the scientific world an immense mass of observation and experiment had grown up in relation to this subject. From the earliest times the shepherd, the farmer, the horticulturist, and the "fancier" had for practical purposes made themselves acquainted with a number of biological laws, and successfully applied them without exciting more than an occasional notice from the academic students of biology. It is one of Darwin's great merits to have made use of these observations and to have formulated their results to a large extent as the laws of variation and heredity. As the breeder selects a congenital variation which suits his requirements, and by breeding from the animals (or plants) exhibiting that variation obtains a new breed specially characterized by that variation, so in nature is there a selection amongst all the congenital variations of each generation of a species. This selection depends on the fact that more young are born than the natural provision of food will support. In consequence of this excess of births there is a struggle for existence and a survival of the fittest, and consequently an ever-present necessarily-acting selection, which either maintains accurately the form of the species from generation to generation or leads to its modification in correspondence with changes in the surrounding circumstances which have relation to its fitness for success in the struggle for life.

New development of teleology.

Darwin's introduction of thremmatology into the domain of scientific biology was accompanied by a new and special development of a branch of study which had previously been known as teleology, the study of the adaptation of organic structures to the service of the organisms in which they occur. It cannot be said that previously to Darwin there had been any very profound study of teleology, but it had been the delight of a certain type of mind—that of the lovers of nature or naturalists *par excellence*, as they were sometimes termed—to watch the habits of living animals and plants, and to point out the remarkable ways in which the structure of each variety of organic life was adapted to the special circumstances of life of the variety or species. The astonishing colors and grotesque forms of some animals and plants which the museum zoologists gravely described without comment were shown by these observers of living nature to have their significance in the economy of the organism possessing them; and a general doctrine was recognized, to the effect that no part or structure of an organism is without definite use and adaptation, being *designed* by the Creator for the benefit of the creature to which it belongs, or else for the benefit, amusement, or instruction of his highest creature—man. Teleology in this form of the doctrine of design was never very deeply rooted amongst scientific anatomists and systematists. It was considered permissible to speculate somewhat vaguely on the subject of the utility of this or that startling variety of structure; but few attempts, though some of great importance, were made to systematically explain by observation and experiment the adaptation of organic structures to particular purposes in the case of the lower animals and plants. Teleology had, however, an important part in the development of what is called physiology, viz., the knowledge of the mechanism, the physical and chemical properties, of the parts of the body of man and the higher animals allied to him. The doctrine of organs and functions—the organ designed so as to execute the function, and the whole system of organs and functions building up a complex mechanism, the complete animal or plant—was teleological in origin (see PHYSIOLOGY), and led to brilliant discoveries in the hands of the physiologists of the last and the preceding century. As applied to lower and more obscure forms of life, teleology presented almost insurmountable difficulties; and consequently, in place of exact experiment and demonstration, the most reckless though ingenious assumptions were made as to the utility of the parts and organs of lower animals, which tended to bring so-called comparative physiology and teleology generally into disrepute. Darwin's theory had as one of its results the reformation and rehabilitation of teleology. According to that theory, every organ, every part, color, and peculiarity of an organism must either be of benefit to that organism itself or have been so to its ancestors; no peculiarity of structure or general conformation, no habit or instinct in any organism, can be supposed to exist for the benefit or amusement of another organism, not even for the delectation of man himself. Necessarily, according to the theory of natural selection, structures either are present because they are selected as useful or because they are still inherited from ancestors to whom they were useful, though no longer useful to the existing representatives of those ancestors.

The conception thus put forward entirely re-founded teleology. Structures previously inexplicable were explained as survivals from a past age, no longer useful though once of value. Every variety of form and color was urgently and absolutely called upon to produce its title to existence either as an active useful agent or as a survival. Darwin himself spent a large part of the later years of his life in thus extending the new teleology. A beginning only has as yet been made in the new life of that branch of zoological and botanical study.

The old doctrine of types, which was used by the philosophically-minded zoologists (and botanists) of the first half of the century as a ready means of explaining the failures and difficulties of the doctrine of design, fell into its proper place under the new dispensation. The adherence to type, the favorite conception of the transcendental morphologist, was seen to be nothing more than the expression of one of the laws of thremmatology, the persistence of hereditary transmission of ancestral characters, even when they have ceased to be significant or valuable in the struggle for existence, whilst the so-called evidences of design which was supposed to modify the limitations of types assigned to Himself by the Creator were seen to be adaptations due to the selection and intensification by selective breeding of fortuitous congenital variations, which happened to prove more useful than the many thousand other variations which did not survive in the struggle for existence.

Effects of Darwin's theory upon zoology.

Thus not only did Darwin's theory give a new basis to the study of organic structure, but, whilst rendering the general theory of organic evolution equally acceptable and necessary, it explained the existence of low and simple forms of life as survivals of the earliest ancestry of more highly complex forms, and revealed the classifications of the systematist as unconscious attempts to construct the genealogical tree or pedigree of plants and animals. Finally, it brought the simplest living matter or formless protoplasm before the mental vision as the starting-point whence, by the operation of necessary mechanical causes, the highest forms have been evolved, and it rendered unavoidable the conclusion that this earliest living material was itself evolved by gradual processes, the result also of the known and recognized laws of physics and chemistry, from material which we should call not living. It abolished the conception of life as an entity above and beyond the common properties of matter, and led to the conviction that the marvellous and exceptional qualities of that which we call "living" matter are nothing more nor less than an exceptionally complicated development of those chemical and physical properties which we recognize in a gradually ascending scale of evolution in the carbon com-

pounds, containing nitrogen as well as oxygen, sulphur, and hydrogen as constituent atoms of their enormous molecules. Thus mysticism was finally banished from the domain of biology, and zoology became one of the physical sciences,—the science which seeks to arrange and discuss the phenomena of animal life and form as the outcome of the operation of the laws of physics and chemistry.

Nature and Scope of Zoology.

Division into morphology and physiology inadequate.

The brief historical outline above given is sufficient to justify us in rejecting, for the purposes of an adequate appreciation of the history and scope of zoology, that simple division of the science into morphology and physiology which is a favorite one at the present day. No doubt the division is a logical one, based as it is upon the distinction of the study of form and structure in themselves (morphology) from the study of what are the activities and functions of the forms and structures (physiology). Such logical divisions are possible upon a variety of bases, but are not necessarily conducive to the ascertainment and remembrance of the historical progress and present significance of the science to which they are applied. As a matter of convenience and as the outcome of historical events it happens that in the universities of Europe, whilst botany in its entirety is usually represented by one chair, the animal side of biology is represented by a chair of so-called zoology, which is understood as the old-fashioned systematic zoology, a chair of human and comparative anatomy, and a chair of physiology (signifying the mechanics, physics, and chemistry of animals especially in relation to man). Fifty years ago the chairs of anatomy and physiology were united in one. No such distinction of mental activities as that involved in the division of the study of animal life into morphology and physiology has ever really existed: the investigator of animal forms has never entirely ignored the functions of the forms studied by him, and the experimental inquirer into the functions and properties of animal tissues and organs has always taken very careful account of the forms of those tissues and organs.

A subdivision based on historical progress.

A more instructive subdivision of the science of animal biology or zoology is one which shall correspond to the separate currents of thought and mental preoccupation which have been historically manifested in western Europe in the gradual evolution of what is to-day the great river of zoological doctrine to which they have all been rendered contributory. Such a subdivision of zoology, whilst it enables us to trace the history of thought, corresponds very closely with the actual varieties of mental attitude exhibited at the present day by the devotees of zoological study, though it must be remembered that the gathering together of all the separate currents by Darwin is certain sooner or later to entail new developments and branchings of the stream.

We accordingly recognize the following five branches of zoological study:

1. *Morphography.*—The work of the collector and systematist: exemplified by Linnæus and his predecessors, by Cuvier, Agassiz, Haeckel.
2. *Bionomics.*—The lore of the farmer, gardener, sportsman, fancier, and field-naturalist, including, thremmatology, or the science of breeding, and the allied teleology, or science of organic adaptations: exemplified by the patriarch Jacob, the poet Virgil, Sprengel, Kirby and Spence, Wallace, and Darwin.
3. *Zoo-Dynamics, Zoo-Physics, Zoo-Chemistry.*—The pursuit of the learned physician,—anatomy and physiology: exemplified by Harvey, Haller, Hunter, Johann Müller.
4. *Plasmology.*—The study of the ultimate corpuscles of living matter, their structure, development, and properties, by the aid of the microscope; exemplified by Malpighi, Hook, Schwann, Kowalewsky.
5. *Philosophical Zoology.*—General conceptions with regard to the relations of living things (especially animals) to the universe, to man, and to the Creator, their origin and significance: exemplified in the writings of the philosophers of classical antiquity, and of Linnæus, Goethe, Lamarck, Cuvier, Lyell, H. Spencer, and Darwin.

It is true that it is impossible to assign the great names of the present century to a single one of the subdivisions of the science thus recognized. With men of an earlier date such special assignment is possible, and there would be no difficulty about thus separating the minor specialists of modern times. But the fact is that as we approach Darwin's epoch we find the separate streams more and more freely connected with one another by anastomosing branches; and the men who have left their mark on the progress of science have been precisely those who have been instrumental in bringing about such confluence, and have distinguished themselves by the influence of their discoveries or generalizations upon several lines of work. At last, in Darwin we find a name which might appear in each of our subdivisions,—a zoologist to whose doctrine all are contributory, and by whose labors all are united and reformed.

We shall now briefly sketch the history of these streams of thought, premising that one has (so far as the last three centuries are concerned) but little start of another, and that sooner or later the influence of the progress of one branch makes itself felt in the progress of another.

Morphography.

Meaning of morphography.

Under this head we include the systematic exploration and tabulation of the facts involved in the recognition of all the recent and extinct kinds of animals and their distribution in space and time. (1) The museum-makers of old days and their modern representatives the enrators and describers of zoological collections, (2) early explorers and modern naturalist-travellers and writers on zoo-geography, and (3) collectors of fossils and palæontologists are the chief varieties of zoological workers coming under this head. Gradually since the time of Hunter and Cuvier anatomical study has associated itself with the more superficial morphography until to-day no one considers a study of animal form of any value which does not include internal structure, histology, and embryology in its scope.

Edward Wotton.

The real dawn of zoology after the legendary period of the Middle Ages is connected with the name of an Englishman, Wotton, born at Oxford in 1492, who practiced as a physician in London and died in 1555. He published a treatise *De Differentiis Animalium* at Paris in 1552. In many respects Wotton was simply an exponent of Aristotle, whose teaching, with various fanciful additions, constituted the real basis of zoological knowledge throughout the Middle Ages. It was Wotton's merit that he rejected the legendary and fantastic accretions, and returned to Aristotle and the observation of nature. The most ready means of noting the progress of zoology during the 16th, 17th, and 18th centuries is to compare the classificatory conceptions of successive naturalists with those which are to be found in the works of Aristotle himself. Aristotle's classification.

Aristotle did not definitely and in tabular form propound a classification of animals, but from a study of his treatises *Historia Animalium*, *De Generatione Animalium*, and *De Partibus Animalium* the following classification can be arrived at:

A. Ἔναιμα, blood-holding animals (= *Vertebrata*).
1. Ζωοτοκοῦντα ἐν αὐτοῖς, viviparous *Enæma* (= Mammals, including the whale).
2. Ὄρνιθες (= Birds).
3. Τετράποδα ἢ ἄποδα ὠοτοκοῦντα, four-footed or legless *Enæma* which lay eggs (= Reptiles and *Amphibia*).
4. Ἰχθυες (= Fishes).
B. Ἄναιμα, bloodless animals (= *Invertebrata*).
1. Μαλάκια, soft-bodied *Anæma* (= *Cephalopoda*).
2. Μαλακόστρακα, soft-shelled *Anæma* (= *Crustacea*).
3. Ἔντομα, insected *Anæma* or Insects (= *Arthropoda*, exclusive of *Crustacea*).
4. Ὀστρακοδέρματα, shell-bearing *Anæma* (= *Echini, Gastropoda*, and *Lamellibranchia*).

Wotton's modifications.

Wotton follows Aristotle in the division of animals into the *Enœma* and the *Anœma*, and in fact in the recognition of all the groups above given, adding only one large group to those recognized by Aristotle under the *Anœma*, namely, the group of *Zoophyta*, in which Wotton includes the *Holothuriæ*, Star-Fishes, *Medusæ*, Sea-Anemones, and Sponges. Wotton divides the viviparous quadrupeds into the many-toed, double-hoofed, and single-hoofed. By the introduction of a method of classification which was due to the superficial Pliny,—viz., one depending, not on structure, but on the medium inhabited by an animal, whether earth, air, or water, Wotton is led to associate Fishes and Whales as aquatic animals. But this is only a momentary lapse, for he broadly distinguishes the two kinds.

Gesner.

Conrad Gesner (1516–1565), who was a physician and held professorial chairs in various Swiss cities, is the most voluminous and instructive of these earliest writers on systematic zoology, and was so highly esteemed that his *Historia Animalium* was republished a hundred years after his death. His great work appeared in successive parts,—*e.g. Vivipara, Ovipara, Aves, Pisces, Serpentes et Scorpio*,—and contains descriptions and illustrations of a large number of animal forms with reference to the lands inhabited by them. Gesner's work, like that of John Johnstone (*b.* 1603), who was of Scottish descent and studied at St. Andrews, and like that of Ulysses Aldrovandi of Bologna (*b.* 1522), was essentially a compilation, more or less critical, of all such records, pictures, and relations concerning beasts, birds, reptiles, fishes, and monsters as could be gathered together by one reading in the great libraries of Europe, travelling from city to city, and frequenting the company of those who either had themselves passed into distant lands or possessed the letters written and sometimes the specimens brought home by adventurous persons.

Medical anatomists and microscopists.

The exploration of parts of the New World next brought to hand descriptions and specimens of many novel forms of animal life, and in the latter part of the 16th century and the beginning of the 17th that careful study by "specialists" of the structure and life-history of particular groups of animals was commenced which, directed at first to common and familiar kinds, was gradually extended until it formed a sufficient body of knowledge to serve as an anatomical basis for classification. This minuter study had two origins, one in the researches of the medical anatomists, such as Fabricius (1537–1619,) Severinus (1580–1656), Harvey (1578–1657), and Tyson (1649–1708), the other in the careful work of the entomologists and first microscopists, such as Malpighi (1628–1694), Swammerdam (1637–1680), and Hooke (1635–1703). The commencement of anatomical investigations deserves notice here as influencing the general accuracy and minuteness with which zoological work was prosecuted, but it was not until a late date that their full influence was brought to bear upon systematic zoology by Georges Cuvier (1769–1832).

John Ray.

The most prominent name between that of Gesner and Linnæus in the history of systematic zoology is that of John Ray (*q.v.*). Though not so extensive as that of Linnæus, his work is of the highest importance, and rendered the subsequent labors of the Swedish naturalist far easier than they would otherwise have been. A chief merit of Ray is to have limited the term "species" and to have assigned to it the significance which it has until the Darwinian era borne, whereas previously it was loosely and vaguely applied. He also made considerable use of anatomical characters in his definitions of larger groups, and may thus be considered as the father of modern zoology. Associated with Ray in his work, and more especially occupied with the study of the Worms and *Mollusca*, was Martin Lister (1638–1712), who is celebrated also as the author of the first geological map.

From Ray to Linnæus.

After Ray's death in London in 1705 the progress of anatomical knowledge, and of the discovery and illustration of new forms of animal life from distant lands, continued with increasing vigor. We note the names of Vallisnieri (1661–1730) and Alexander Monro (1697–1767); the travellers Tournefort (1656–1708) and Shaw (1695–1763); the collectors Rumphius (1637–1706) and Hans Sloane (1660–1753); the entomologist, Réaumur (1683–1757); Lhwyd (1703) and Linck (1674–1734), the students of Star-Fishes; Peyssonel (b. 1694), the investigator of Polyps and the opponent of Marsigli and Réaumur, who held them to be plants; Woodward, the palæontologist (1665–1728),—not to speak of others of less importance.

Linnæus.

Two years after Ray's death Carl Linnæus (*q.v.*) was born. Unlike Jacob Theodore Klein (1685–1759), whose careful treatises on various groups of plants and animals were published during the period between Ray and Linnæus, the latter had his career marked out for him in a university, that of Upsala, where he was first professor of medicine and subsequently of natural history. His lectures formed a new departure in the academic treatment of zoology and botany, which, in direct continuity from the Middle Ages, had hitherto been subjected to the traditions of the medical profession and regarded as mere branches of "materia medica." Linnæus taught zoology and botany as branches of knowledge to be studied for their own intrinsic interest. His great work, the *Systema Naturæ*, ran through twelve editions during his lifetime (1st ed. 1735, 12th 1768). Apart from his special discoveries in the anatomy of plants and animals, and his descriptions of new species, the great merit of Linnæus was his introduction of a method of enumeration and classification which may be said to have created systematic zoology and botany in their present form, and establishes his name forever as the great organizer, the man who recognized a great practical want in the use of language and supplied it. Linnæus adopted Ray's conception of species, but he made species a practical reality by insisting that every species shall have a double Latin name,—the first half to be the name of the genus common to several species, and the second half to be the specific name. Previously to Linnæus long many-worded names had been used, sometimes with one additional adjective, sometimes with another, so that no true *names* were fixed and accepted. Linnæus by his binomial system made it possible to write and speak with accuracy of any given species of plant or animal. He was, in fact, the Adam of zoological science. He proceeded further to introduce into his enumeration of animals and plants a series of groups, viz., genus, order, class, which he compared to the subdivisions of an army or the subdivisions of a territory, the greater containing several of the less, as follows:

Class.	Order.	Genus.	Species.	Variety.
Genus summum.	Genus inter-medium.	Genus proximum.	Species.	Individuum.
Provincia.	Territorium.	Parœcia.	Pagus.	Domicilium.
Legio.	Cohors.	Manipulus.	Contubernium.	Miles.

Linnæus himself recognized the purely subjective character of his larger groups; for him species were, however, objective: "there are," he said, "just so many species as in the beginning the Infinite Being created." It was reserved for a philosophic zoologist of the 19th century (Agassiz, *Essay on Classification*, 1859) to maintain dogmatically that genus, order and class were also objective facts, capable of precise estimation and valuation. This climax was reached at the very moment when Darwin was publishing the *Origin of Species* (1859), by which universal opinion has been brought to the position that species, as well as genera, orders, and classes, are the subjective expressions of a vast ramifying pedigree in which the only objective existences are individuals, the apparent species as well as higher groups being marked out, not by any distributive law, but by the purely non-significant operation of human experience, which cannot transcend the results of death and decay.

Classification of Linnæus.

The classification of Linnæus (from *Syst. Nat.*, 12th ed., 1766) should be compared with that of Aristotle. It is as follows,—the complete list of Linnæan genera being here reproduced:

Class I. Mammalia.
- Order 1. *Primates.* Genera: *Homo, Simia, Lemur, Vespertilio.*
- " 2. *Bruta.* Genera: *Elephas, Trichecus, Bradypus, Myrmecophaga, Manis, Dasypus.*
- " 3. *Feræ.* Genera: *Phoca, Canis, Felis, Viverra, Mustela, Ursus, Didelphys, Talpa, Sorex, Erinaceus.*
- " 4. *Glires.* Genera: *Hystrix, Lepus, Castor, Mus, Sciurus, Noctitio.*
- " 5. *Pecora.* Genera: *Camelus, Moschus, Cervus, Capra, Oris, Bos.*
- " 6. *Belluæ.* Genera: *Equus, Hippopotamus, Sus, Rhinoceros.*
- " 7. *Cete.* Genera: *Monodon, Balæna, Physeter, Delphinus.*

Class II. Aves.
- Order 1. *Accipitres.* Genera: *Vultur, Falco, Strix, Lanius.*
- " 2. *Picæ.* Genera: (*a*) *Trochilus, Certhia, Upupa, Buphaga, Sitta, Oriolus, Coracias, Gracula, Corvus, Paradisea;* (*b*) *Ramphastos, Trogon, Psittacus, Crotophaga, Picus, Yunx, Cuculus, Bucco;* (*c*) *Buccros, Alcedo, Merops, Todos.*
- " 3. *Anseres.* Genera: (*a*) *Anas, Mergus, Phaethon, Plotus;* (*b*) *Rhyncops, Diomedea, Alca, Procellaria, Pelecanus, Larus, Sterna, Colymbus.*
- " 4. *Grallæ.* Genera: (*a*) *Phœnicopterus, Platalea, Palamedea, Mycteria, Tantalus, Ardea, Recurvirostra, Scolopax, Tringa, Fulica, Parra, Rallus, Psophia, Cancroma;* (*b*) *Hematopus, Charadrius, Otis, Struthio.*
- " 5. *Gallinæ.* Genera: *Didus, Pavo, Meleagris, Crax, Phasianus, Tetrao, Numida.*
- " 6. *Passeres.* Genera: (*a*) *Loxia, Fringilla, Emberiza;* (*b*) *Caprimulgus, Hirundo, Pipra;* (*c*) *Turdus, Ampelis, Tanagra, Muscicapa;* (*d*) *Parus, Motacilla, Alauda, Sturnus, Columba.*

Class III. Amphibia.
- Order 1. *Reptilia.* Genera: *Testudo, Draco, Lacerta, Rana.*
- " 2. *Serpentes.* Genera: *Crotalus, Boa, Coluber, Anguis, Amphisbæna, Cæcilia.*
- " 3. *Nantes.* Genera: *Petromyzon, Raja, Squalus, Chimæra, Lophius, Acipenser, Cyclopterus, Balistes, Ostracion, Tetrodon, Diodon, Centriscus, Syngnathus, Pegasus.*

Class IV. Pisces.
- Order 1. *Apodes.* Genera: *Muræna, Gymnotus, Trichiurus, Anarrhichas, Ammodytes, Ophidium, Stromateus, Xiphias.*
- " 2. *Jugulares.* Genera: *Callionymus, Uranoscopus, Trachinus, Gadus, Blennius.*
- " 3. *Thoracici.* Genera: *Cepola, Echeneis, Coryphæna, Gobius, Cottus, Scorpæna, Zeus, Pleuronectes, Chætodon, Sparus, Labrus, Sciæna, Perca, Gasterosteus, Scomber, Mullus, Trigla.*
- " 4. *Abdominales.* Genera: *Cobitis, Amia, Silurus, Zeuthis, Loricaria, Salmo, Fistularia, Esox, Elops, Argentina, Atherina, Mugil, Mormyrus, Exocœtus, Polynemus, Clupea, Cyprinus.*

Class V. Insecta.
- Order 1. *Coleoptera.* Genera: (*a*) *Scarabæus, Lucanus, Dermestes, Hister, Byrrhus, Gyrinus, Attelabus, Curculio, Silpha, Coccinella;* (*b*) *Bruchus, Cassida, Ptinus, Chrysomela, Hispa, Meloe, Tenebrio, Lampyris, Mordella, Staphylinus;* (*c*) *Cerambyx, Leptura, Cantharis, Elater, Cicindela, Buprestis, Dytiscus, Carabus, Necydalis, Forficula.*
- " 2. *Hemiptera.* Genera: *Blatta, Mantis, Gryllus, Fulgora, Cicada, Notonecta, Nepa, Cimex, Aphis, Chermes, Coccus, Thrips.*
- " 3. *Lepidoptera.* Genera: *Papilio, Sphinx, Phalæna.*
- " 4. *Neuroptera.* Genera: *Libellula, Ephemera, Myrmeleon, Phryganea, Hemerobius, Panorpa, Raphidia.*
- " 5. *Hymenoptera.* Genera: *Cynips, Tenthredo, Sirex, Ichneumon, Sphex, Chrysis, Vespa, Apis, Formica, Mutilla.*
- " 6. *Diptera.* Genera: *Œstrus, Tipula, Musca, Tabanus, Culex, Empis, Conops, Asilus, Bombylius, Hippobosca.*
- " 7. *Aptera.* Genera: (*a*) Pedibus sex; capite a thorace discreto: *Lepisma, Podura, Termes, Pediculus, Pulex.* (*b*) Pedibus 8–14; capite thoraceque unitis: *Acarus, Phalangium, Aranea, Scorpio, Cancer, Monoculus, Oniscus.* (*c*) Pedibus pluribus; capite a thorace discreto: *Scolopendra, Julus.*

Class VI. Vermes.
- Order 1. *Intestina.* Genera: (*a*) Pertusa laterali poro: *Lumbricus, Sipunculus, Fasciola.* (*b*) Imperforata poro laterali nullo: *Gordius, Ascaris, Hirudo, Myxine.*
- " 2. *Mollusca.* Genera: (*a*) Ore supero; basi se affigens: *Actinia, Ascidia.* (*b*) Ore antico; corpore pertuso laterali foraminulo: *Limax, Aplysia, Doris, Tethis.* (*c*) Ore antico; corpore tentaculis antice cincto: *Holothuria, Terebella.* (*d*) Ore antico; corpore brachiato: *Triton, Sepia, Clio, Lernæa, Scyllæa.* (*e*) Ore antico; corpore pedato; *Aphrodita, Nereis.* (*f*) Ore infero centrali: *Medusa, Asteria, Echinus.*
- " 3. *Testacea.* Genera: (*a*) Multivalvia: *Chiton, Lepas, Pholas.* (*b*) Bivalvia (= *Conchæ*): *Mya, Solen, Tellina, Cardium, Mactra, Donax, Venus, Spondylus, Chama, Arca, Ostrea, Anomia, Mytilus, Pinna.* (*c*) Univalvia spira regulari (= *Cochleæ*): *Argonauta, Nautilus, Conus, Cypræa, Bulla, Voluta, Buccinum, Strombus, Murex, Trochus, Turbo, Helix, Nerita, Haliotis.* (*d*) Univalvia absque spira regulari: *Patella, Dentalium, Serpula, Teredo, Sabella.*

Order 4. *Lithophyta.*
Genera: *Tubipora, Madrepora, Millepora, Cellepora.*
" 5. *Zoophyta.*
Genera: (*a*) Fixata: *Isis, Gorgonia, Alcyonium, Spongia, Flustra, Tubularia, Corallina, Sertularia, Vorticella.*
(*b*) Locomotiva: *Hydra, Pennatula, Tænia, Volvox, Furia, Chaos.*

The characters of the six classes are thus given by Linnæus:

Cor biloculare, biauritum; Sanguine calido, rubro:	viviparis, *Mammalibus;* oviparis, *Avibus.*
Cor uniloculare, uniauritum;[1] Sanguine frigido, rubro:	pulmone arbitrario, *Amphibiis;* branchiis externis, *Piscibus.*
Cor uniloculare, inauritum; Sanie frigida, albida:	antennatis, *Insectis;* tentaculatis, *Vermibus.*

From Linnæus to Cuvier.

Between Linnæus and Cuvier there are no very great names; but under the stimulus given by the admirable method and system of Linnæus observation and description of new forms from all parts of the world, both recent and fossil, accumulated. We can only cite the names of Charles Bonnet (1720–1793), the entomologist, who described the reproduction of *Aphis;* Banks and Solander, who accompanied Captain Cook on his first voyage (1768–1771); Thomas Pennant (1726–1798), the describer of the English fauna; Peter Simon Pallas (1741–1811), who specially extended the knowledge of the Linnæan *Vermes*, and under the patronage of the empress Catherine explored Russia and Siberia; De Geer (1720–1778), the entomologist Lyonnet (1707–1789), the author of the monograph of the anatomy of the caterpiller of *Cossus ligniperdus;* Cavolini (1756–1810), the Neapolitan marine zoologist and forerunner of Della Chiaje (fl. 1828); O. F. Müller (1730–1784), the describer of freshwater *Oligochæta;* Abraham Trembley (1700–1784), the student of *Hydra;* and Ledermüller (1719–1769), the inventor of the term *Infusoria*. The effect of the Linnæan system upon the general conceptions of zoologists was no less marked than were its results in the way of stimulating the accumulation of accurately observed details. The notion of a *scala naturæ*, which had since the days of classical antiquity been a part of the general philosophy of nature amongst those who occupied themselves with such conceptions, now took a more definite form in the minds of skilled zoologists. The species of Linnæus were supposed to represent a series of steps in a scale of ascending complexity, and it was thought possible thus to arrange the animal kingdom in a single series,—the orders within the classes succeeding one another in regular gradation, and the classes succeeding one another in a similar rectilinear progression. LAMARCK (*q.v.*) represents most completely, both by his development theory (to be further mentioned below) and by his scheme of classification, the high-water mark of the popular but fallacious conception of a *scala naturæ*. His classification (1801 to 1812) is as follows:

Lamarck's classification.

Invertebrata.
1. *Apathetic Animals.*
Class I. INFUSORIA.
Orders: *Nuda, Appendiculata.*
Class II. POLYPI.
Orders: *Ciliati* (*Rotifera*), *Denudati* (Hydroids), *Vaginati* (*Anthozoa* and *Polyzoa*), *Natantes* (Crinoids).
Class III. RADIARIA.
Orders: *Mollia* (*Acalephæ*), *Echinoderma* (including *Actiniæ*).
Class IV. TUNICATA.
Orders: *Bothryllaria, Ascidia.*
Class V. VERMES.
Orders: *Molles* (Tape-Worms and Flukes), *Rigiduli* (Nematoids), *Hispiduli* (*Nais*, etc.), *Epizoariæ* (Lernæans, etc.).
2. *Sensitive Animals.*
Class VI. INSECTA (*Hexapoda*).
Orders: *Aptera, Diptera, Hemiptera, Lepidoptera, Hymenoptera, Neuroptera, Orthoptera, Coleoptera.*
Class VII. ARACHNIDA.
Orders: *Antennato-Trachealia* (= *Thysanura* and *Myriapoda*), *Exantennato-Trachealia, Exantennato-Branchialia.*
Class VIII. CRUSTACEA.
Orders: *Heterobranchia* (*Branchiopoda, Isopoda, Amphipoda, Stomapoda*), *Homobranchia* (*Decapoda*).
Class IX. ANNELIDA.
Orders: *Apoda, Antennata, Sedentaria.*
Class X. CIRRIPEDIA.
Orders: *Sessilia, Pedunculata.*
Class XI. CONCHIFERA.
Orders: *Dimyaria, Monomyaria.*
Class XII. MOLLUSCA.
Orders: *Pteropoda, Gasteropoda, Trachelipoda, Cephalopoda, Heteropoda.*

Vertebrata.
3. *Intelligent Animals.*
Class XIII. FISHES.
" XIV. REPTILES.
Class XV. BIRDS.
" XVI. MAMMALS.

The enumeration of orders above given will enable the reader to form some conception of the progress of knowledge relating to the lower forms of life during the fifty years which intervened between Linnæus and Lamarck. The number of genera recognized by Lamarck is more than ten times as great as that recorded by Linnæus.

We have mentioned Lamarck before his great contemporary Cuvier because, in spite of his valuable philosophical doctrine of development, he was, as compared with Cuvier and estimated as a systematic zoologist, a mere enlargement and logical outcome of Linnæus.

The distinctive merit of CUVIER (*q.v.*) is that he started a new view as to the relationships of animals, which he may be said in a large measure to have demonstrated as true by his own anatomical researches. He opposed the *scala naturæ* theory, and recognized four distinct and divergent branches or *embranchemens*, as he called them, in each of which he arranged a certain number of the Linnæan classes, or similar classes. The *embranchemens* were characterized each by a different type of anatomical structure. Cuvier thus laid the foundation of that branching tree-like arrangement of the classes and orders of animals which we now recognize as being the necessary result of attempts to represent what is practically a genealogical tree or pedigree. Apart from this Cuvier was a keen-sighted and enthusiastic anatomist of great skill and industry. It is astonishing how many good observers it requires to dissect and draw and record over and over again the structure of an animal before an approximately correct account of it is obtained. Cuvier dissected many Molluscs and other animals which had not previously been anatomized; of others he gave more correct accounts than had been given by earlier writers. Skilful as he was, his observations are very frequently erroneous. Great accuracy in work as well as great abundance of production has only distinguished one amongst all the great names of zoology—that of Johann Müller. It certainly did not distinguish Cuvier. Another special distinction of Cuvier is his remarkable work in comparing extinct with recent organisms, his descriptions of the fossil *Mammalia* of the Paris basin, and his general application of the knowledge of recent animals to the reconstruction of extinct ones, as indicated by fragments only of their skeletons.

Cuvier.

It was in 1812 that Cuvier communicated to the Academy of Sciences of Paris his views on the classification of animals. He says:

[1] The anatomical error in reference to the auricles of Reptiles and Batrachians on the part of Linnæus is extremely interesting, since it shows to what an extent the most patent facts may escape the observation of even the greatest observers, and what an amount of repeated dissection and unprejudiced attention has been necessary before the structure of the commonest animals has become known.

"Si l'on considère le règne animal d'après les principes que nous venons de poser, en se debarassant des préjugés établis sur les divisions aneiennement admises, en n'ayant égard qu' à l'organisation et à la nature des animaux, et non pas à leur grandeur, à leur utilité, au plus ou moins de connaissance que nous en avons, ni à toutes les autres circonstances accessoires, on trouvera qu'il existe quatre formes principales, quatre plans généraux, si l'on peut s'exprimer ainsi, d'après lesquels tous les animaux semblent avoir été modelés et dont les divisions ultérieures, de quelque titre que les naturalistes les aient décorées, ne sont que des modifications assez légères, fondées sur le développement, ou l'addition de quelques parties qui ne changent rien à l'essence du plan."

Cuvier's classification.

His classification as finally elaborated in *Le Règne Animal* (Paris, 1829) is as follows:

First Branch. **Animalia Vertebrata.**
- Class I. Mammalia.
  - Orders: *Bimana, Quadrumana, Carnivora, Marsupialia, Rodentia, Edentata, Pachydermata, Ruminantia, Cetacea.*
- Class II. Birds.
  - Orders: *Accipitres, Passeres, Scansores, Gallinæ, Grallæ, Palmipedes.*
- Class III. Reptilia.
  - Orders: *Chelonia, Sauria, Ophidia, Batrachia.*
- Class IV. Fishes.
  - Orders: (*a*) *Acanthopterygii, Abdominales, Subbrachii, Apodes, Lophobranchii, Plectognathi;* (*b*) *Sturiones, Selachii, Cyclostomi.*

Second Branch. **Animalia Mollusca.**
- Class I. Cephalopoda.
- Class II. Pteropoda.
- Class III. Gastropoda.
  - Orders: *Pulmonata, Nudibranchia, Inferobranchia, Tectibranchia, Heteropoda, Pectinibranchia, Tubulibranchia, Scutibranchia, Cyclobranchia.*
- Class IV. Acephala.
  - Orders: *Testacea, Tunicata.*
- Class V. Brachiopoda.
- Class VI. Cirrhopoda.

Third Branch. **Animalia Articulata.**
- Class I. Annelides.
  - Orders: *Tubicolæ, Dorsibranchiæ, Abranchiæ.*
- Class II. Crustacea.
  - Orders: (*a*) Malacostraca; *Decapoda, Stomapoda, Amphipoda, Læmodipoda, Isopoda;* (*b*) Entomostraca: *Branchiopoda, Pœcilopoda, Trilobitæ.*
- Class III. Arachnides.
  - Orders: *Pulmonariæ, Trachcariæ.*
- Class IV. Insects.
  - Orders: *Myriapoda, Thysanura, Parasita, Suctoria, Coleoptera, Orthoptera, Hemiptera, Neuroptera, Hymenoptera, Lepidoptera, Rhipiptera, Diptera.*

Fourth Branch. **Animalia Radiata.**
- Class I. Echinoderms.
  - Orders: *Pedicellata, Apoda.*
- Class II. Intestinal Worms.
  - Orders: *Nematoidea, Parenchymatosa.*
- Class III. Acalephæ.
  - Orders: *Simplices, Hydrostaticæ.*
- Class IV. Polypi (including the *Cœlentera* of later authorities and the *Polyzoa*).
  - Orders: *Carnosi, Gelatinosi, Polypiarii.*
- Class V. Infusoria.
  - Orders: *Rotifera, Homogenea* (this includes the *Protozoa* of recent writers and some *Protophyta*).

The leading idea of Cuvier, his four *embranchemens*, was confirmed by the Russo-German naturalist Von Baer (1792–1876), who adopted Cuvier's divisions, speaking of them as the peripheric, the longitudinal, the massive, and the vertebrate types of structure. Von Baer, however, has another place in the history of zoology, being the first and most striking figure in the introduction of embryology into the consideration of the relations of animals to one another.

Von Baer.

Cuvier may be regarded as *the* zoologist by whom anatomy was made the one important guide to the understanding of the relations of animals. But it should be noted that the belief, dating from Malpighi (1670), that there *is* a relationship to be discovered, and not merely a haphazard congregation of varieties of structure to be classified, had previously gained ground. Cuvier was familiar with the speculations of the "Natur-philosophen," and with the doctrine of transmutation and filiation by which they endeavored to account for existing animal forms. The noble aim of F. W. J. Schelling, "das ganze System der Naturlehre von dem Gesetze der Schwere bis zu den Bildungstrieben der Organismus als ein organisches Ganze darzustellen," which has ultimately been realized through Darwin, was a general one among the scientific men of the year 1800. Lamarck accepted the development theory fully, and pushed his speculations far beyond the realm of fact. The more cautious Cuvier adopted a view of the relationships of animals which, whilst denying genetic connection as the explanation, recognized an essential identity of structure throughout whole groups of animals. This identity was held to be due to an ultimate law of nature or the Creator's plan. The tracing out of this identity in diversity, whether regarded as evidence of blood-relationship or as a remarkable display of skill on the part of the Creator in varying the details whilst retaining the essential, became at this period a special pursuit, to which Goethe, the poet, who himself contributed importantly to it, gave the name "morphology." C. F. Wolff, Goethe, and Oken share the credit of having initiated these views, in regard especially to the structure of flowering plants and the Vertebrate skull. Cuvier's doctrine of four plans of structure was essentially a morphological one, and so was the single-scale doctrine of Buffon and Lamarck, to which it was opposed. Cuvier's morphological doctrine received its fullest development in the principle of the "correlation of parts," which he applied to palæontological investigation, namely, that every animal is a definite whole, and that no part can be varied without entailing correlated and law-abiding variations in other parts, so that from a fragment it should be possible, had we a full knowledge of the laws of animal structure or morphology, to reconstruct the whole. Here Cuvier was imperfectly formulating, without recognizing the real physical basis of the phenomena, the results of the laws of heredity, which were subsequently investigated and brought to bear on the problems of animal structure by Darwin.

The morphologists.

Richard Owen[1] may be regarded as the foremost of Cuvier's disciples. Owen not only occupied himself with the dissection of rare animals, such as the Pearly Nautilus, *Lingula*, *Limulus*, *Protopterus*, *Apteryx*, etc., and with the description and reconstruction of extinct Reptiles, Birds, and Mammals,—following the Cuvierian tradition,—but gave precision and currency to the morphological doctrines which had taken their rise in the beginning of the century by the introduction of two terms, "homology" and "analogy," which were defined so as to express two different kinds of agreement in animal structures, which, owing to the want of such "counters of thought," had been hitherto continually confused. *Analogous* structures in any two animals compared were by Owen defined as structures performing similar functions, but not necessarily derived from the modification of one and the same part in the "plan" or "archetype" according to which the two animals compared were supposed to be constructed. *Homologous* structures were such as, though greatly differing in appearance and detail from one another, and though performing widely different functions, yet were capable of being shown by adequate study of a series of intermediate forms to be derived from one and the same part or organ of the "plan-form" or "archetype." It is not easy to exaggerate the service rendered by Owen to the study of zoology by the introduction of this apparently small piece of verbal mechanism; it

R. Owen.

Homology and analogy.

[1] Born in 1804 in Lancaster; conservator of the Hunterian Museum, London, 1830–56; superintendent Nat. Hist. Brit. Mus., 1856–84.

takes place with the classificatory terms of Linnæus. And, though the conceptions of "archetypal morphology," to which it had reference are now abandoned in favor of a genetic morphology, yet we should remember, in estimating the value of this and of other speculations which have given place to new views in the history of science, the words of the great reformer himself. "Erroneous observations are in the highest degree injurious to the progress of science, since they often persist for a long time. But erroneous theories, when they are supported by facts, do little harm, since every one takes a healthy pleasure in proving their falsity" (Darwin). Owen's definition of analogous structures holds good at the present day. His homologous structures are now spoken of as "homogenetic" structures, the idea of community of representation in an archetype giving place to community of derivation from a single representative structure present in a common ancestor. Darwinian morphology has further rendered necessary the introduction of the terms "homoplasy" and "homoplastic" [1] to express that close agreement in *form* which may be attained in the course of evolutional changes by organs or parts in two animals which have been subjected to similar moulding conditions of the environment, but have no genetic community of origin, to account for their close similarity in form and structure.

Owen's classification.

The classification adopted by Owen in his lectures (1855) does not adequately illustrate the progress of zoological knowledge between Cuvier's death and that date, but, such as it is, it is worth citing here.

Province: **Vertebrata** (*Myelencephala*, Owen).
Classes: MAMMALIA, AVES, REPTILIA, PISCES.
Province: **Articulata.**
Classes: ARACHNIDA, INSECTA (including Sub-Classes *Myriapoda*, *Hexapoda*), CRUSTACEA (including Sub-Classes *Entomostraca*, *Malacostraca*), EPIZOA (Epizootie *Crustacea*), ANNELLATA (Chætopods and Leeches), CIRRIPEDIA.
Province: **Mollusca.**
Classes: CEPHALOPODA, GASTEROPODA, PTEROPODA, LAMELLIBRANCHIATA, BRACHIOPODA, TUNICATA.
Province: **Radiata.**
Sub-Province: **Radiaria.**
Classes: ECHINODERMATA, BRYOZOA, ANTHOZOA, ACALEPHÆ, HYDROZOA.
Sub-Province: **Entozoa.**
Classes: CŒLELMINTHA, STERELMINTHA.
Sub-Province: **Infusoria.**
Classes: ROTIFERA, POLYGASTRIA (the *Protozoa* of recent authors).

The real centre of progress of systematic zoology was no longer in France nor with the disciples of Cuvier in England, but after his death moved to Germany. The wave of morphological speculation, with its outcome of new systems and new theories of classification, which were as numerous as the professors of zoological science,[2] was necessarily succeeded in the true progress of the science by a period of minuter study in which the microscope, the discovery of embryological histories, and the all-important cell-theory came to swell the stream of exact knowledge.

Johann Müller.

We have already mentioned Von Baer in this connection, and given a passing reference to Johann MÜLLER (*q.v.*), the greatest of all investigators of animal structure in the present century. Müller (1801–1858) was in Germany the successor of Rathke (1793–1860) and of Meckel (1781–1833) as the leader of anatomical investigation; but his true greatness can only be estimated by a consideration of the fact that he was a great teacher not only of human and comparative anatomy and zoology but also of physiology, and that nearly all the most distinguished German zoologists and physiologists of the period 1850 to 1870 were his pupils and acknowledged his leadership. The most striking feature about Johann Müller's work, apart from the comprehensiveness of his point of view, in which he added to the anatomical and morphological ideas of Cuvier a consideration of physiology, embryology, and microscopic structure, was the extraordinary accuracy, facility, and completeness of his recorded observations. He could do more with a single specimen of a rare animal (*e.g.*, in his memoir on *Amphioxus*, Berlin, 1844) in the way of making out its complete structure than the ablest of his contemporaries or successors could do with a plethora. His power of rapid and exhaustive observation and of accurate pictorial reproduction was phenomenal. His most important memoirs, besides that just mentioned, are those on the anatomy and classification of Fishes, on the Cœcilians, and on the developmental history of the Echinoderms.

J. V. Thompson.

A name which is apt to be forgotten in the period between Cuvier and Darwin, because its possessor occupied an isolated position in England and was not borne up by any great school or university, is that of John Vaughan Thompson, who was an army surgeon, and when past the age of forty, being district medical inspector at Cork (1830), took to the study of marine *Invertebrata* by the aid of the microscope. Thompson made three great discoveries, which seem to have fallen in his way in the most natural and simple manner, but must be regarded really as the outcome of extraordinary genius. He showed that the organisms like *Flustra* are not hydroid Polyps, but of a more complex structure resembling Molluscs, and he gave them the name *Polyzoa*. He discovered the *Pentacrinus europæus*, and showed that it was the larval form of the Feather-Star *Antedon* (*Comatula*). He upset Cuvier's retention of the Cirripedes among *Mollusca*, and his subsequent treatment of them as an isolated class, by showing that they begin life as free-swimming *Crustacea* identical with the young forms of other *Crustacea*. Vaughan Thompson is a type of the marine zoologists, such as Dalyell, Michael Sars, P. J. Van Beneden, Claparède, and Allman, who during the present century have approached the study of the lower marine organisms in the same spirit as that in which Trembley and Schäffer in the last century, and Swammerdam in the 17th, gave themselves to the study of the minute freshwater forms of animal life.

It is impossible to enumerate or to give due consideration to all the names in the army of anatomical and embryological students of the middle third of this century whose labors bore fruit in the modification of zoological theories and in the building up of a true classification of animals. Their results are best summed up in the three schemes of classification which follow below —those of Rudolph Leuckart (b. 1823), Henri Milne-Edwards (1800–1884), and T. H. Huxley (b. 1825), all of whom individually contributed very greatly by their special discoveries and researches to the increase of exact knowledge.

Single-fact systems of classification.

Contemporaneous with these were various schemes of classification which were based, not on a consideration of the entire structure of each animal, but on the variations of a single organ, or on the really non-significant fact of the structure of the egg. All such single-fact systems have proved to be useless and in fact departures from the true line of growth of the zoological system which was shaping itself year by year—unknown to those who so shaped it—as a genealogical tree. They were attempts to arrive at a true knowledge of the relationships of animals by "royal roads"; their followers were landed in barren wastes.

Leuckart's classification.

R. Leuckart's[3] classification is as follows:

[1] See Lankester, "On the Use of the Term Homology in Modern Zoology and the Distinction between Homogenetic and Homoplastic Agreements," *Ann. and Mag. Nat. Hist.*, 1870.

[2] See Agassiz, *Essay on Classification*. 1859. for an account of them.

[3] *Die Morphologie und die Verwandtschaftsverhältnisse der wirbellosen Thiere*, Brunswick, 1848. The *Protozoa*, recognized as a primary group by Siebold and Stannius (*Lehrbuch d. vergleich.*

Type 1. **Cœlenterata.**
Class I. Polypi.
Orders: *Anthozoa* and *Cylicozoa.*
" II. Acalephæ.
Orders: *Discophoræ* and *Ctenophoræ.*
Type 2. **Echinodermata.**
Class I. Pelmatozoa.
Orders: *Cystidea* and *Crinoidea.*
" II. Actinozoa.
Orders: *Echinida* and *Asterida.*
" III. Scytodermata.
Orders: *Holothuriæ* and *Sipunculida.*
Type 3. **Vermes.**
Class I. Anenteræti.
Orders: *Cestodes* and *Acanthocephali.*
" II. Apodes.
Orders: *Nemertini, Turbellarii, Trematodes,* and *Hirudinei.*
" III. Ciliati.
Orders: *Bryozoa* and *Rotifera.*
" IV. Annelides.
Orders: *Nematodes, Lumbricini,* and *Branchiati.*
Type 4. **Arthropoda.**
Class I. Crustacea.
Orders: *Entomostraca* and *Malacostraca.*
" II. Insecta.
Orders: *Myriapoda, Arachnida* (*Acera,* Latr.), and *Hexapoda.*
Type 5. **Mollusca.**
Class I. Tunicata.
Orders: *Ascidiæ* and *Salpæ.*
" II. Acephala.
Orders: *Lamellibranchiata* and *Brachiopoda.*
" III. Gasteropoda.
Orders: *Heterobranchia, Dermatobranchia, Heteropoda, Ctenobranchia, Pulmonata,* and *Cyclobranchia.*
" IV. Cephalopoda.
Type 6. **Vertebrata.** (Not specially dealt with.)

Milne-Edwards's classification.

The classification given by Henri Milne-Edwards[1] is as follows:

Branch I. **Osteozoaria** or **Vertebrata.**
Sub-Branch 1. **Allantoidians.**
Class I. Mammalia.
Orders: (*a*) Monodelphia: *Bimana, Quadrumana, Cheiroptera, Insectivora, Rodentia, Edentata, Carnivora, Amphibia, Pachydermata, Ruminantia, Cetacea;* (*b*) Didelphia: *Marsupialia, Monotremata.*
" II. Birds.
Orders: *Rapaces, Passeres, Scansores, Gallinæ, Grallæ, Palmipedes.*
" III. Reptiles.
Orders: *Chelonia, Sauria, Ophidia.*
Sub-Branch 2. **Anallantoidians.**
Class I. Batrachians.
Orders: *Anura, Urodela, Perennibranchia, Cœciliæ.*
" II. Fishes.
Section 1. *Ossei.*
Orders: *Acanthopterygii, Abdominales, Subbrachii, Apodes, Lophobranchii, Plectognathi.*
Section 2. *Chondropterygii.*
Orders: *Sturiones, Selachii, Cyclostomi.*
Branch II. **Entomozoa** or **Annelata.**
Sub-Branch 1. **Arthropoda.**
Class I. Insecta.
Orders: *Coleoptera, Orthoptera, Neuroptera, Hymenoptera, Lepidoptera, Hemiptera, Diptera, Rhipiptera, Anopleura, Thysanura.*
" II. Myriapoda.
Orders: *Chilognatha* and *Chilopoda.*
" III. Arachnids.
Orders: *Pulmonaria* and *Trachearia.*
" IV. Crustacea.
Section 1. *Podophthalmia.*
Orders: *Decapoda* and *Stomopoda.*
Section 2. *Edriophthalmi.*
Orders: *Amphipoda, Lœmodipoda,* and *Isopoda.*
Section 3. *Branchiopoda.*
Orders: *Ostracoda, Phyllopoda,* and *Trilobitæ.*
Section 4. *Entomostraca.*
Orders: *Copepoda, Cladocera, Siphonostoma, Lernæida, Cirripedia.*
Section 5. *Xiphosura.*

(The orders of the classes which follow are not given in the work quoted.)
Sub-Branch 2. **Vermes.**
Class I. Annelids. Class IV. Cestoidea.
" II. Helminths. " V. Rotatoria.
" III. Turbellaria.
Branch III. **Malacozoaria** or **Mollusca.**
Sub-Branch 1. **Mollusca** proper.
Class I. Cephalopoda. Class III. Gasteropoda.
" II. Pteropoda. " IV. Acephala.
Sub-Branch 2. **Molluscoidea.**
Class I. Tunicata. Class II. Bryozoa.
Branch IV. **Zoophytes.**
Sub-Branch 1. **Radiaria.**
Class I. Echinoderms. Class III. Corallaria or
" II. Acalephs. Polypi.
Sub-Branch 2. **Sarcodaria.**
Class I. Infusoria. Class II. Spongiaria.

Huxley's classification.

In England T. H. Huxley adopted in his lectures (1869) a classification which was in many respects similar to both of the foregoing, but embodied improvements of his own. It is as follows:

Sub-Kingdom I. **Protozoa.**
Classes: Rhizopoda, Gregarinida, Radiolaria, Spongida.
Sub-Kingdom II. **Infusoria.**
Sub-Kingdom III. **Cœlenterata.**
Classes: Hydrozoa, Actinozoa.
Sub-Kingdom IV. **Annuloida.**
Classes: Scolecida, Echinodermata.
Sub-Kingdom V. **Annulosa.**
Classes: Crustacea, Arachnida, Myriapoda, Insecta, Chætognatha, Annelida.
Sub-Kingdom VI. **Molluscoida.**
Classes: Polyzoa, Brachiopoda, Tunicata.
Sub-Kingdom VII. **Mollusca.**
Classes: Lamellibranchiata, Branchiogastropoda, Pulmogastropoda, Pteropoda, Cephalopoda.
Sub-Kingdom VIII, **Vertebrata.**
Classes: Pisces, Amphibia, Reptilia, Aves, Mammalia.

We now arrive at the period when the doctrine of organic evolution was established by Darwin, and when naturalists, being convinced by him as they had not been by the transmutationists of fifty years' earlier date, were compelled to take an entirely new view of the significance of all attempts at framing a "natural" classification.

Classifications based on structure.

Many zoologists—prominent among them in Great Britain being Huxley—had been repelled by the airy fancies and assumptions of the "philosophical" morphologists. The efforts of the best minds in zoology had been directed for thirty years or more to ascertaining with increased accuracy and minuteness the structure, microscopic and gross, of all possible forms of animals, and not only of the adult structure but of the steps of development of that structure in the growth of each kind of organism from the egg to maturity. Putting aside fantastic theories, these observers endeavored to give in their classifications a strictly objective representation of the facts of animal structure and of the structural relationships of animals to one another capable of demonstration. The groups within groups adopted for this purpose were necessarily wanting in symmetry: the whole system presented a strangely irregular character. From time to time efforts were made by those who believed that the Creator must have followed a symmetrical system in his production of animals to force one or other artificial, neatly balanced scheme of classification upon the zoological world. The last of these was that of Louis Agassiz (*Essay on Classification*, 1859), who, whilst surveying all previous classifications, propounded a scheme

L. Agassiz.

Anatomie, Berlin, 1845), are not included at all by Leuckart in his scheme. The name *Protozoa* was first used by Goldfuss (1809) to include microscopic animals and also the Polyps and *Medusæ*, and Siebold and Stannius first used it in its modern signification as comprising and limited to the *Infusoria* and *Rhizopoda*.

[1] *Cours Élémentaire d'Histoire Naturelle*, Paris, 1855.

of his own, in which, as well as in the criticisms he applies to other systems, the leading notion is that sub-kingdoms, classes, orders, and families have a real existence, and that it is possible to ascertain and distinguish characters which are of class value, others which are only of ordinal value, and so on, so that the classes of one sub-kingdom should on paper, and in nature actually do, correspond in relative value to those of another sub-kingdom, and the orders of any one class similarly should be so taken as to be of equal value with those of another class, and have been actually so created.

Influence of Darwinian doctrine on taxonomy.

The whole position was changed by the acquiescence, which became universal, in the doctrine of Darwin. That doctrine took some few years to produce its effect, but it became evident at once to those who accepted Darwinism that *the* natural classification of animals, after which collectors and anatomists, morphologists, philosophers, and embryologists had been so long striving was nothing more nor less than a genealogical tree, with breaks and gaps of various extent in its record. The facts of the relationships of animals to one another, which had been treated as the outcome of an inscrutable law by most zoologists and glibly explained by the transcendental morphologists, were amongst the most powerful arguments in support of Darwin's theory, since they, together with all other vital phenomena, received a sufficient explanation through it. It is to be noted that, whilst the zoological system took the form of a genealogical tree, with main stem and numerous diverging branches, the actual form of that tree, its limitation to a certain number of branches corresponding to a limited number of divergencies in structure, came to be regarded as the necessary consequence of the operation of the physico-chemical laws of the universe, and it was recognized that the ultimate explanation of that limitation is to be found only in the constitution of matter itself.

Haeckel.

The first naturalist to put into practical form the consequences of the new theory, in so far as it affected zoological classification, was Ernst Haeckel of Jena (b. 1834), who in 1866, seven years after the publication of Darwin's *Origin of Species*, published his suggestive *Generelle Morphologie*. Haeckel introduced into classification a number of terms intended to indicate the branchings of a genealogical tree. The whole "system" or scheme of classification was termed a genealogical tree (*Stammbaum*); the main branches were termed "phyla," their branchings "sub-phyla"; the great branches of the sub-phyla were termed "cladi," and the "cladi" divided into "classes," these into sub-classes, these into legions, legions into orders, orders into sub-orders, sub-orders into tribes, tribes into families, families into genera, genera into species. Additional branchings could be indicated by similar terms where necessary. There was no attempt in Haeckel's use of these terms to make them exactly or more than approximately equal in significance; such attempts were clearly futile and unimportant where the purpose was the exhibition of lines of descent, and where no natural equality of groups was to be expected *ex hypothesi*. Haeckel's classification of 1866 was naturally enough only a first attempt. In the edition of the *Natürliche Schöpfungsgeschichte* published in 1868, he made a great advance in his genealogical classification, since he now introduced the results of the extraordinary activity in the study of embryology which followed on the publication of the *Origin of Species*.

Cellular embryology.

The pre-Darwinian systematists since the time of Von Baer had attached very great importance to embryological facts, holding that the stages in an animal's development were often more significant of its true affinities than its adult structure. Von Baer had gained unanimous support for his dictum, "Die Entwickelungsgeschichte ist der wahre Lichtträger für Untersuchungen über organische Körper." Thus J. Müller's studies on the larval forms of Echinoderms and the discoveries of Vaughan Thompson were appreciated. But it was only after Darwin that the cell-theory of Schwann was extended to the embryology of the animal kingdom generally, and that the knowledge of the development of an animal became a knowledge of the way in which the millions of cells of which its body is composed take their origin by fission from a smaller number of cells, and these at last from the single egg-cell. Kölliker (*Development of Cephalopods*, 1844), Remak (*Development of the Frog*, 1850), and others had laid the foundations of this knowledge in isolated examples; but it was Kowalewsky, by his accounts of the development of Ascidians and of *Amphioxus* (1866), who really made zoologists see that a strict and complete cellular embryology of animals was as necessary and feasible a factor in the comprehension of their relationships as at the beginning of the century the coarse anatomy had been shown to be by Cuvier. Kowalewsky's work appeared between the dates of the *Generelle Morphologie* and the *Schöpfungsgeschichte*. Haeckel himself, with his pupil Miklucho-Maclay, had in the meantime made studies on the growth from the egg of Sponges,—studies which resulted in the complete separation of the unicellular or equicellular *Protozoa* from the Sponges, hitherto confounded with them. It is this introduction of the consideration of cell-structure and cell-development which, subsequently to the establishment of Darwinism, has most profoundly modified the views of systematists, and led in conjunction with the genealogical doctrine to the greatest activity in research—an activity which culminated in the work (1873–82) of F. M. Balfour, and produced the profoundest modifications in classification.

Haeckel's second arrangement.

Haeckel's earlier pedigree is worth comparing with his second effort, as showing the beginning of the influence just noted. The second pedigree is as follows:

Phyla.	Clades.	Classes.
Protozoa.	Ovularia.	*Archezoa.*
		Gregarinæ.
		Infusoria.
	Blastularia.	*Planæada.*
		Gastræada.
Zoophyta.	Spongiæ.	*Porifera.*
	Acalephæ.	*Coralla.*
		Hydromedusæ.
		Ctenophora.
Vermes.	Acœlomi.	*Platyhelminthes.*
	Cœlomati.	*Nemathelminthes.*
		Bryozoa.
		Tunicata.
		Rhynchocœla.
		Gephyræa.
		Rotatoria.
		Annelida.
Mollusca.	Acephala.	*Spirobranchia.*
		Lamellibranchia.
	Eucephala.	*Cochlides.*
		Cephalopoda.
Echinoderma.	Colobrachia.	*Asterida.*
		Crinoida.
	Lipobrachia.	*Echinida.*
		Holothuriæ.
Arthropoda.	Carides.	*Crustacea.*
	Tracheata.	*Arachnida.*
		Myriapoda.
		Insecta.
Vertebrata.	Acrania.	*Leptocardia.*
	Monorrhina.	*Cyclostoma.*
	Anamnia.	*Pisces.*
		Dipneusta.
		Halisauria.
		Amphibia.
	Amniota.	*Reptilia.*
		Aves.
		Mammalia.

In representing pictorially the groups of the animal kingdom as the branches of a tree, it becomes obvious that a distinction may be drawn, not merely be-

tween the individual main branches, but further as to the level at which they are given off from the main stem, so that one branch or set of branches may be marked off as belonging to an earlier or lower level than another set of branches; and the same plan may be adopted with regard to the clades, classes, and smaller branches. The term "grade" was introduced by Lankester[1] to indicate this giving off of branches at a higher or lower, *i.e.*, a later or earlier, level of a main stem. The mechanism for the statement of the genealogical relationships of the groups of the animal kingdom was thus completed. Renewed study of every group was the result of the acceptance of the genealogical idea and of the recognition of the importance of cellular embryology. On the one hand, the true method of arriving at a knowledge of the genealogical tree was recognized as lying chiefly in attacking the problem of the genealogical relationships of the smallest twigs of the tree, and proceeding from them to the larger branches. Special studies of small families or orders of animals with this object in view were taken in hand by many zoologists. On the other hand, a survey of the facts of cellular embryology which were accumulated in regard to a variety of classes within a few years of Kowalewsky's work led to a generalization, independently arrived at by Haeckel and Lankester, to the effect that a lower grade of animals may be distinguished, the *Protozoa* or *Plastidozoa*, which consist either of single cells or colonies of equiformal cells, and a higher grade, the *Metazoa* or *Enterozoa*, in which the egg-cell by "cell division" gives rise to two layers of cells, the endoderm and the ectoderm, surrounding a primitive digestive chamber, the archenteron. Of these latter, two grades were further distinguished by Lankester,—those which remain possessed of a single archenteric cavity and of two primary cell-layers (the *Cœlentera* or *Diploblastica*), and those which by nipping off the archenteron give rise to two cavities, the cœlom or body-cavity and the metenteron or gut (*Cœlomata* or *Triploblastica*). To the primitive two-cell-layered form, the hypothetical ancestor of all *Metazoa* or *Enterozoa*, Haeckel gave the name *Gastræa*; the embryonic form which represents in the individual growth from the egg this ancestral condition he called a "gastrula." The term "diblastula" has more recently been adopted in England for the gastrula of Haeckel. The tracing of the exact mode of development, cell by cell, of the diblastula, the cœlom, and the various tissues of examples of all classes of animals has been pursued during the last twenty years with immense activity and increasing instrumental facilities, and is still in progress.

Dendriform distribution of animal kingdom.

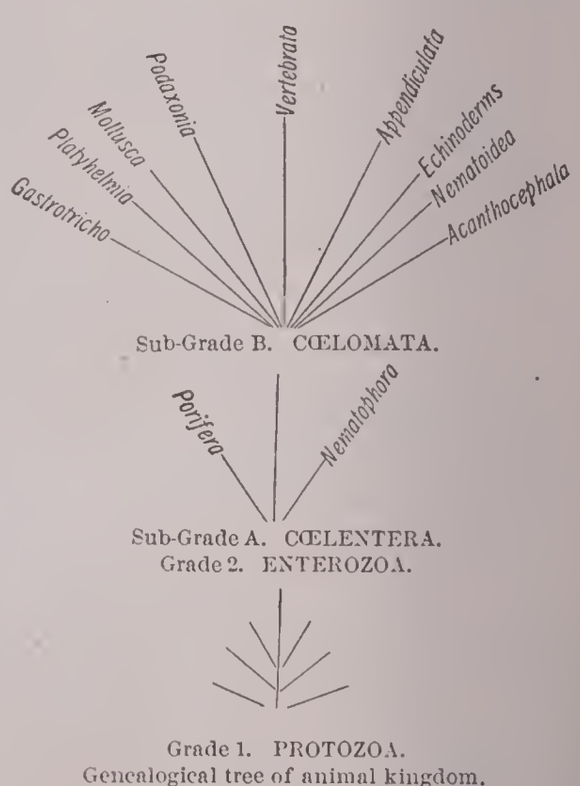
Two names in connection with post-Darwinian taxonomy and the ideas connected with it require brief mention here. Fritz Müller, by his studies on *Crustacea* (*Für Darwin*, 1864), showed the way in which genealogical theory may be applied to the minute study of a limited group. He is also responsible for the formulation of an important principle, called by Haeckel "the biogenetic fundamental law," viz., that an animal in its growth from the egg to the adult condition tends to pass through a series of stages which are recapitulative of the stages through which its ancestry has passed in the historical development of the species from a primitive form; or, more shortly, that the development of the individual (ontogeny) is an epitome of the development of the race (phylogeny). Pre-Darwinian zoologists had been aware of the class of facts thus interpreted by Fritz Müller, but the authoritative view on the subject had been that there is a parallelism between (*a*) the series of forms which occur in individual development, (*b*) the series of existing forms from lower to higher, and (*c*) the series of forms which succeed one another in the strata of the earth's crust, whilst an explanation of this parallelism was either not attempted, or was illusively offered in the shape of a doctrine of harmony of plan in creation. It was the application of Fritz Müller's law of recapitulation which gave the chief stimulus to recent embryological investigations; and, though it is now recognized that "recapitulation" is vastly and bewilderingly modified by special adaptations in every case, yet the principle has served, and still serves, as a guide of great value.

Fritz Müller's recapitulation.

Another important factor in the present condition of zoological knowledge as represented by classification is the doctrine of degeneration propounded by Anton Dohrn. Lamarck believed in a single progressive series of forms, whilst Cuvier introduced the conception of branches. The first post-Darwinian systematists naturally and without reflection accepted the idea that existing simpler forms represent stages in the gradual progress of development,—are in fact survivors from past ages which have retained the exact grade of development which their ancestors had reached in past ages. The assumption made was that (with the rare exception of parasites) all the change of structure through which the successive generations of animals have passed has been one of progressive elaboration.

Dohrn's doctrine of degeneration.

It is Dohrn's merit to have pointed out[2] that this assumption is not warranted, and that degeneration or progressive simplification of structure may have, and in many lines certainly has, taken place, as well as progressive elaboration and continuous maintenance of the *status quo*. The introduction of this conception



Genealogical tree of animal kingdom.

necessarily has had a most important effect in the attempt to unravel the genealogical affinities of animals. It renders the task a more complicated one; at the same time it removes some serious difficulties and throws a flood of light on every group of the animal kingdom.

One result of the introduction of the new conceptions dating from Darwin has been a healthy reaction from that attitude of mind which led to the regarding of the classes and orders recognized by authoritative zoologists as sacred institutions which were beyond the criticism of ordinary men. That state of mind was due to the fact that the groupings so recognized did not profess to be simply the result of scientific reasoning, but were necessarily regarded as the expressions of the "in-

[1] "Notes on Embryology and Classification," in *Quart. Journ. Micr. Sci.*, 1877

[2] *Ursprung der Wirbelthiere*, Leipsic, 1875; and Lankester, *Degeneration*, London, 1880.

sight" of some more or less gifted persons into a plan or system which had been arbitrarily chosen by the Creator.

Consequently there was a tinge of theological dogmatism about the whole matter. To deny the Linnæan, or later the Cuvierian, classes was very much like denying the Mosaic cosmogony. At the present time systematic zoology is entirely free from any such prejudices, and the Linnæan taint which is apparent even in Haeckel and Gegenbaur may be considered as finally expunged.

Classification of Ray Lankester.

We give below the classification of Ray Lankester as an example of the most recent genealogical classification. It is represented by the above genealogical tree and the tabular statement which follows. The chief points in this classification are the inclusion of *Balanoglossus* and the *Tunicata* in the phylum *Vertebrata*, the association of the *Rotifera* and the *Chætopoda* with the *Arthropoda* in the phylum *Appendiculata*, the inclusion of *Limulus* and the *Eurypterina* in the class *Arachnida*, and the total abandoning of the indefinite and indefensible group of "*Vermes*."

Grade A. *PLASTIDOZOA* (*PROTOZOA*).

Grade *a*. *GYMNOMYXA*.
- Class I. PROTEOMORPHA (no orders recognized).
- " II. MYCETOZOA.
  - Orders.—1. *Sorophora*. 2. *Endosporea*. 3. *Erosporea*.
- " III. LOBOSA.
  - Orders.—1. *Nuda*. 2. *Testacea*.
- " IV. LABYRINTHULIDEA (no orders).
- " V. HELIOZOA.
  - Orders.—1. *Aphrothoraca*. 2. *Chlamydophora*. 3. *Chalarothoraca*. 4. *Desmothoraca*.
- " VI. RETICULARIA.
  - Sub-Class *a*. *Imperforata*.
    - Orders.—1. *Gromiidea*. 2. *Astrorhizidea*. 3. *Miliolidea*. 4. *Lituolidea*.
  - Sub-Class *b*. *Perforata*.
    - Orders.—1. *Textularidea*. 2. *Chilostomellidea*. 3. *Lagenidea*. 4. *Globigerinidea*. 5. *Rotalidea*. 6. *Nummulinidea*.
- " VII. RADIOLARIA.
  - Sub-Class *a*. *Silicoskeleta*.
    - Orders.—1. *Peripylæa*. 2. *Monopylæa*. 3. *Phæodaria*.
  - Sub-Class *b*. *Acanthinoskelcta*.
    - Order.—1. *Acanthometridea*.

Grade *b*. *CORTICATA*.
- Class I. SPOROZOA.
  - Sub-Class *a*. *Gregarinidea*.
    - Orders.—1. *Haplocyta*. 2. *Septata*.
  - Sub-Class *b*. *Coccidiidea*.
    - Orders.—1. *Monosporea*. 2. *Oligosporea*. 3. *Polysporea*.
  - Sub-Class *c*. *Myxosporidea* (no orders).
  - " *d*. *Sarcocystidea* (no orders).
- " II. FLAGELLATA.
  - Sub-Class *a*. *Lissoflagellata*.
    - Orders.—1. *Monadidea*. 2. *Euglenoidea*. 3. *Heteromastigoda*. 4. *Isomastigoda*.
  - Sub-Class *b*. *Choanoflagellata*.
    - Orders.—1. *Nuda*. 2. *Loricata*. 3. *Gelatinigera*.
- " III. DINOFLAGELLATA.
  - Orders.—1. *Adinida*. 2. *Dinifera*.
- " IV. RHYNCHOFLAGELLATA (no orders).
- " V. CILIATA.
  - Orders.—1. *Peritricha*. 2. *Hetcrotricha*. 3. *Holotricha*. 4. *Hypotricha*.
- " VI. ACINETARIA.
  - Orders.—1. *Suctoria*. 2. *Non-Suctoria*.

Grade B. *ENTEROZOA*.

Sub-Grade A. *CŒLENTERA*.

Phylum 1. **NEMATOPHORA.**

- Class I. HYDROMEDUSÆ.
  - Orders.—1. *Anthomedusæ* (*Gymnoblastœa*). 2. *Leptomedusæ* (*Calyptoblastœa*), 3. *Narcomedusæ*. 4. *Trachomedusæ*. 5. *Hydrocorallinæ*. 6. *Siphonophora*.
- Class II. SCYPHOMEDUSÆ.
  - Sub-Class *a*. *Tetrameralia*.
    - Orders.—1. *Calycozoa*. 2. *Peromedusæ*. 3. *Cubomedusæ*.
  - Sub-Class *b*. *Octomeralia*.
    - Orders.—1. *Cannostomæ*. 2. *Semostomæ*. 3. *Rhizostomæ*.
- " III. ANTHOZOA.
  - Sub-Class *a*. *Actiniomorpha*.
    - Orders.—1. *Actiniaria*. 2. *Antipathuria*. 3. *Madreporaria*.
  - Sub-Class *b*. *Alcyoniomorpha*.
    - Orders.—1. *Protalcyonaria*. 2. *Stolonifera*. 3. *Alcyonaria*. 4. *Paragorgonaria*. 5. *Gorgonaria*. 6. *Pennatularia*. 7. *Helioporaria*.
- Class IV. CTENOPHORA.
  - Orders.—1. *Saccata*. 2. *Eurystoma*. 3. *Tæniata*. 4. *Lobata*.

Phylum 2. **PORIFERA.**

- Class I. CALCISPONGIÆ (=*Megamastictora*).
  - Orders.—1. *Homocœla*. 2. *Heterocœla*.
- " II. SILICOSPONGIÆ (=*Micromastictora*).
  - Sub-Class 1. *Hyalospongiæ*.
    - Order. *Hexactinellaria*.
  - Sub-Class 2. *Demospongiæ*.
    - Orders.—1. *Tetractinellaria*. 2. *Monaxonaria*. 3. *Halisarcaria*.

Sub-Grade B. *CŒLOMATA*.

Phylum 1. **VERTEBRATA.**

Branch A. **Hemichorda** (*Balanoglossus*).
" B. **Urochorda.**
Grade I. **Larvalia** (no divisions recognized).
" II. **Saccata.**
- Class I. ASCIDIÆ.
  - Orders.—1. *Simplices*. 2. *Sociales*. 3. *Compositæ*. 4. *Pyrosomiidea*.
- " II. SALPIFORMIA.
  - Orders.—1. *Salpiidea*. 2. *Doliolidea*.

Branch C. **Cephalochorda** (*Amphioxus*).
" D. **Craniata.**
Grade I. **Cyclostoma.**
- Class I. MYXINOIDEA (no orders).
- " II. PETROMYZONTIA (no orders).

Grade II. **Gnathostoma.**
Sub-Grade *a*. **Branchiata Heterodactyla.**
- Class I. PISCES.
  - Sub-Class 1. *Selachii*.
    - Orders.—1. *Squali*. 2. *Raii*.
  - Sub-Class 2. *Holocephali* (no orders).
  - " 3. *Ganoidei*.
    - Orders.—1. *Chondrostei*. 2. *Polypterini*. 3. *Lepidosteini*. 4. *Amidini*. 5. *Cephalaspidini*. 6. *Placodermi*. 7. *Acanthodini*. 8. *Pycnodontini*. 9. *Cœlacanthini*. 10. *Dipterini*.
  - Sub-Class 4. *Teleostei*.
    - Orders.—1. *Physostomi*. 2. *Pharyngognathi*. 3. *Anacanthini*. 4. *Acanthopteri*. 5. *Plectognathi*. 6. *Lophobranchia*.
- " II. DIPNOI.
  - Orders.—1. *Monopneumones*. 2. *Dipneumones*.

Branch A. **Glossophora.**
Class I. GASTROPODA.
Grade 1. **Isopleura.**
Orders.—1. *Polyplacophora.* 2. *Neomeniaria.* 3. *Chætodermaria.*
Grade 2. **Aniscpleura.**
Branch *a.* *Streptoneura.*
Orders.—1. *Zygobranchia.* 2. *Azygobranchia.*
Branch *b.* *Euthyneura.*
Orders.—1. *Opisthobranchia.* 2. *Pulmonata.*
" II. SCAPHOPODA.
(Genus: *Dentalium.*)
" III. CEPHALOPODA (=*Siphonopoda.*)
Orders.—1. *Tetrabranchia.* 2. *Dibranchia.*
Branch B. **Lipocephala.**
Class. LAMELLIBRANCHIA.
Orders.—1. *Isomya.* 2. *Heteromya.* 3. *Monomya.*

We have now traced the history of the morphography of animals so as to show that increasingly in successive epochs independent branches of knowledge have been brought to bear on the consideration of the main problem, namely, the discrimination of the kinds and the relations to one another of animal forms. Before glancing at the history of the remaining branches of zoological science, which have had an independent history whilst ultimately contributory to taxonomy and morphography, it may be briefly pointed out that the accumulation of knowledge with regard to the distribution of animal forms on the earth's surface and in the seas has progressed simultaneously with the discrimination of the mere forms of the species themselves, as has also the knowledge derived from fossilized remains as to the characters of former inhabitants of the globe. Both these subdivisions of morphography have contributed to the establishment of Darwinism,—the one (palæontology) by direct evidence of organic evolution in time, the other (zoo-geography) in a more indirect way.

Development of new species.

Alfred Russell Wallace stands prominently forward as a naturalist-traveller who by his observations, chiefly on Lepidopterous Insects, in both South America and the Malay Archipelago, was led to the conclusion that a production of new species is actually going on, and that, too, by means of a process of natural selection of favorable variations. Wallace and Darwin, who each recognized cordially and fully the other's work, laid their views before the Linnæan Society on the same day in 1859.

Geographical distribution of animals.

The facts of the geographical distribution of animals were systematized, and great zoo-geographical provinces first clearly recognized, by P. L. Sclater in 1857. The application of the Darwinian theory to the facts tabulated by Sclater, combined with a knowledge of the distribution of animals in past geological periods, has led to a full explanation of the migrations of terrestrial animals, and has furnished a striking corroboration of the sufficiency of the doctrine of organic evolution, as reformed by Darwin, to account for all the phenomena of zoology.

Study of marine fauna.

The study of the marine fauna by means of the dredge and trawl had been enthusiastically prosecuted by British, French, and Scandinavian naturalists in the two decades before Darwin's book; the collection of forms, the discovery of new species, and the recording of their bathymetrical and local distribution had produced a great mass of knowledge through the labors of E. Forbes, Gwyn-Jeffreys, Sars, Quatrefages, Norman, and others. The post-Darwinian developments of this line of inquiry have been two. In the first place, dredging and trawling have been extended by the aid of steamships of the Norwegian, British, American, French, and Italian navies into greater depths than were previously supposed to contain living things. New species and genera, and a vast extension of knowledge as to distribution, have been the outcome of these expeditions, connected with the names of G. O. Sars and Daniellsen in Norway, of Alex. Agassiz in America, and of Carpenter and Wyville Thomson in Great Britain. It is worthy of note that the practical demand for sounding the Atlantic in connection with the laying of the first deep-sea telegraph-cable is what led to these explorations, the first recognition of life at these great depths in the ocean being due to Dr. Wallich, who accompanied a sounding expedition in 1860 to the North Atlantic, and to Prof. Fleeming Jenkin, who in the same year acted as engineer in raising the submarine cable between Sardinia and Africa, upon which living corals were found. In the second place, the study of marine zoology, has, since the publication of the *Origin of Species*, been found to require more complete arrangements in the form of laboratories and aquaria than the isolated vacation student could bring with him to the seaside. Seaside laboratories have come into existence: the first was founded in France by Coste (1859) at Cancarneau (Brittany), again with a practical end in view, viz., the study of food-fishes with an aim to pisciculture. The demand for a knowledge of the embryology of all classes of animals, and for further facts as to the structure and life-history of the minuter microscopic or very delicate forms of marine life, is what has determined the multiplication of these marine "stations." The largest and best supported pecuniarily is that founded at Naples by Anton Dohrn in 1872; others exist at Trieste, Villefranche, Cette, and at New Haven and Beaufort in the United States, whilst a large laboratory, on a scale to compare with that at Naples, has this year (1888) been opened at Plymouth by the Marine Biological Association of the United Kingdom.

Expeditions for local study of fauna.

Another result of the stimulus given to zoological research by Darwin's work is the undertaking of voyages to distant lands by skilled anàtomists for the purpose of studying on the spot, and with all the advantages of abundant and living material, the structure, and especially the embryology, of rare and exceptionally interesting forms of animal life. In the pre-Darwinian period of this century zoologists who were convinced of the importance of anatomical and embryological study were still content to study specimens immersed in spirit and brought home, often imperfectly preserved, by unskilled collectors, or to confine their attention to such species as could be procured in Europe. Before Cuvier, as we have already pointed out, attention was, with rare exceptions, limited to the dried skeletons and external forms of animals. Now, however, the enterprising zoologist goes to the native land of an interesting animal, there to study it as fully as possible. The most important of these voyages has been that of W. H. Caldwell of Cambridge to Australia (1885–86) for the purpose of studying the embryology of the *Monotrema* and of *Ceratodus*, the fish-like *Dipnoon*, which has resulted in the discovery that the *Monotrema* are oviparous. Similarly Adam Sedgewick proceeded to the Cape in order to study *Peripatus*. Bateson to the coast of Maryland to study *Balanoglossus*, and the brothers Sarassin to Ceylon to investigate the embryology of the *Cœcilia*.

The task of the zoologist has changed and developed in every succeeding period. Pure morphography has long ceased to be a chief line of research; and now even the preoccupation produced by the addition to it of the study of cellular embryology is about to undergo a modification by the demand for knowledge of the facts of heredity and adaptation in greatly extended detail.

ZOO-MECHANICS, ZOO-PHYSICS, ZOO-CHEMISTRY.

The development of that knowledge of the structure of the human body, and of the chemical and physical

processes going on in it, which is necessary for the purposes of the medical art forms a distinct history, which has both influenced and been influenced by that of other branches of zoology. The study of the structure and composition of the body of man and of the animals nearest to him was until fifty years ago one with the inquiry into the activities of those parts, and indeed the separation of anatomy and physiology has never been really carried out. For convenience of teaching, the description of the coarser anatomy of the human body has been in modern universities placed in the hands of a special professor, theoretically condemned to occupy himself with the mere formal details of structure, whilst the professor of physiology has usually retained what is called "microscopic anatomy," and necessarily occupies himself with as much structural anatomy as is required for a due description of the functions of organs and the properties of tissues. It would seem that in our medical schools and universities these arrangements should be reconsidered. Anatomy and physiology should be re-united and subdivided as follows,—(1) physiology with anatomy in relation to physiology (2) anatomy in relation to surgery and medical diagnosis,—the former being a science, the latter a piece of technical training in rule of thumb.

Study of anatomy and physiology.

Physiological anatomy or anatomical physiology has its beginnings in Aristotle and other observers of antiquity. The later Græco-Roman and the Arabian physicians carried on the traditional knowledge and added to it. Galen dominated the Middle Ages. The modern development begins with Harvey and with the Italian school in which he studied. Its great names are Fabricius of Aquapendente (1537–1619), Vesalius (1514–1564), Eustachius (*c.* 1500–1574), Riolan (1577–1657), Severino (1580–1656). The history of the discovery of the circulation of the blood and of the controversies connected with it gives an interesting and sufficient presentation of the anatomico-physiological knowledge of the period (see HARVEY). The foundation of the scientific academies and the records of their publications furnish thenceforward a picture of the progress in this study. As an early anatomist Willis (1621–1675), professor of physic in Oxford, deserves notice for his work on the anatomy of the human brain, the plates for which were drawn by young Christopher Wren, the prodigy of Oxford common-rooms, who later built St. Paul's Cathedral. The Royal Society, in its early days when Wren was a fellow, met at Gresham College whenever the professor of physic there could obtain a human body for dissection, and amongst its earliest records are the memoirs of Tyson on the anatomy of the Chimpanzee and the experiments on transfusion of blood, extirpation of the spleen, and such like inquiries.

Harvey and the Italian school.

Marcello Malpighi (1628–1694) and Anton van Leeuwenhoek (1632–1723) were the first to introduce the microscope into anatomical research. Malpighi first used the injection of bloodvessels on a large scale, and moreover is to be credited with having first conceived that there is a definite relation of the structure of lower kinds of animals to that of higher and more elaborate kinds, and that this relation is one of gradual transition, so that lower animals are not to be regarded as isolated and arbitrary existences, but are really simpler exhibitions of the same kind of structure and mechanism which occurs in higher animals. It is this conception which later developed into the theory of an actual transmutative development of lower into higher organisms. Leeuwenhoek discovered the red blood corpuscles of Vertebrates, saw the circulation in the capillaries of the Frog's foot, described the fibrillar structure and cross-striping of muscular fibre, the tubular structure of dentine, the scales of the epidermis, the fibres of the lens, and the spermatozoa, these last having been independently discovered at

Malpighi and Leeuwenhoek.

Leyden in 1677 by Ludwig Ham of Stettin. The spermatozoa were regarded by the "animalculists" as the fully formed but minute young which had to be received in the egg, in order to be nourished and increase in size, and were hailed as a decisive blow to Harvey's doctrine of epigenesis and his dictum "omne vivum ex ovo." Albrecht von Haller was the champion of the so-called "evolutionists" in the 18th century, better called "præformationists." Haller wrote, "There is no such thing as development! No part of the animal body is made before another; all are simultaneously created." A corollary of this doctrine was that the germ contains the germs of the next generation, and these of the next, and so *ad infinitum*. It was calculated that Eve at her creation thus contained within her 200,000 millions of human germs. This was the view of the "ovists," who regarded the egg as the true germ, whilst the "animalculists," who regarded the spermatozoon as the essential germ, would have substituted Adam for Eve in the above calculation. These fanciful conceptions—containing as they do a share of important truth—were opposed by Caspar Friedrich Wolff, who in his doctorate dissertation (1759) maintained that the germ is a structureless particle, and acquires its structure by "epigenesis" or gradual development. Wolff has proved to be nearer the truth than Haller; but modern conceptions as to the molecular structure of the egg-protoplasm point to a complexity as great as that imagined by the evolutionists. Later it was maintained that the spermatozoa are parasitic animalcules, and this view prevailed for 150 years, so that in the *Physiology* of Johann Müller (1842) we read, "Whether the spermatozoa are parasitic animalcules or living parts of the animal in which they occur cannot at present be stated with certainty."

Ovists *versus* animalculists.

Physiology in the 18th century could only proceed by means of inferences from purely anatomical observation, aided by imaginative conceptions which had no real basis. The explanation of the processes of life in the animal body was waiting for that progress in the knowledge of physics and chemistry which at last arrived, and gave a new impulse to investigation. Albrecht von Haller (1708–1777) was the first to apply experimental methods to the determination of the functions of the various organs made known by anatomists, and from him we may trace a bifurcation in the tendencies of medical men who occupied themselves with the study of the structure and functions of the animal organism. The one class proceeded more and more in the direction of comparative anatomy, the other in the direction of exact analysis and measurement of both the structure and properties of the organs of Vertebrate animals allied to man and of man himself.

Von Haller

John Hunter (1728–1793) is the most striking figure of this epoch in the relation of medicine to general zoological progress; the preservation of his museum in Lincoln's Inn Fields, London, by the combined action of the state and the Royal College of Surgeons, is an abiding record of the historical progress of biological science. Hunter collected, dissected, and described not only higher but lower animals, with the view of arriving at a knowledge of the function of organs by the most extensive and systematic survey of their modifications in all kinds of animals. His purpose was that of the physiologist and medical man, but he made great contributions to the general knowledge of animal structure. The same class of investigations, when taken up by Cuvier from the point of view of systematic zoology and morphology, led to a reconstruction of classification and laid the foundation of anatomical zoology. Hunter was the younger brother of William Hunter (1718–1783), who also formed an important museum, still preserved in Glasgow. Hunter classified the organs of animals into those which subserve the preservation of the indi-

The two Hunters.

vidual, those which subserve the preservation of the species, and those which are the means of relation with the outer world, and he arranged his museum of dissections and preparations on this plan.

Relations of chemistry and zoology.

The great progress of chemistry at the end of the 18th and the beginning of the 19th century was followed by an application of chemical laws and chemical methods to the study of animal life. Curiously enough, as showing how deeply interwoven are the various lines of scientific progress, Priestley in his discovery of oxygen was as much concerned in the study of a chlorophyll-bearing *Protozoon*, *Euglena viridis*, as in that of the red oxide of mercury; and the interest in "vital spirits" as a physiological factor was an important stimulus to those researches which produced modern chemical knowledge.

Beginnings of histology.

The purely anatomical side of physiological progress is marked in the beginning of the 19th century by the work of Bichat (1771–1802), who distinguished by naked-eye characters the different structural materials of which the organs of man and the higher animals are built, and thus founded in first outline the science of histology. By the end of the first quarter of this century it had become clear to the minds of the anatomico-physiological students of animal life that the animal body was subject to the same physical laws as other matter, although it was still held that some additional and mysterious agent—so-called "vitality"—was at work in living bodies. It had become clear that animal material could be investigated chemically, and that the processes of digestion, assimilation, respiration, and secretion were chemical processes.

Schwann's cell-theory.

To a considerable extent the chemical composition and properties of the tissues, and the chemical nature of the various changes of life and of putrefaction after death, had been investigated, but one step was yet to be taken which brings the study of ultimate structure, chemical activity, form, and the formation of form to a single focus. This was taken by Theodore Schwann (1810–1881), who in 1839 published his epoch-making cell-theory. Schwann was a pupil of Johann Müller, and there can be little doubt that the ideas of the pupil are to be credited in some measure to the master. Schwann took up the thread of microscopic investigation which had been sedulously pursued by a distinct line of students since the days of Hook and Leeuwenhoek, and had resulted in a general doctrine among botanists of the cellular structure of all the parts of plants. Schwann showed not only that plants are uniformly built up by these corpuscular units (of which Robert Browne in 1833 had described the peculiar nucleated structure), but that all animal tissues are also so built up. That, however, was not Schwann's chief point. The cell-theory for which he is famous is this, that the substance of the individual cell is the seat of those chemical processes which seen *en masse* we call life, and that the differences in the properties of the different tissues and organs of animals and plants depend on a difference in the chemical and physical activity of the constitutent cells, resulting in a difference in the form of the cells and in a concomitant difference of activity. Schwann thus pointed to the microscopic cell-unit as the thing to be studied in order to arrive at a true knowledge of the processes of life and the significance of form. In founding the study of cell-substance (or protoplasm, as it was subsequently called by Max Schultze in 1861, adopting the name used by botanists for vegetable cell-contents) Schwann united two lines of inquiry, viz., that of minute investigation of structure and development and that of zoo-chemistry and zoo-physics. He spent a large part of the next forty years in an attempt to penetrate further into the structure of cell-substance; he hoped to be able to find in cell-substance ultimate visible molecules, a knowledge of the arrangement and characters of which would explain the varying properties of protoplasm.

Schwann's other discoveries.

It is not a little remarkable that Schwann, who thus brought about the union of physiological and morphological study by his conception of cell-substance, should also have been the initiator of that special kind of experimental investigation of the physical properties of tissues by the exact methods used by physicists which, by the aid of the kymographion, the thermo-electric pile, and the galvanometer, has been so largely pursued during the last thirty years in our physiological laboratories. It is perhaps less surprising that Schwann, who had so vivid a conception of the activity and potentialities of the cell-unit, should have been the discoverer of the immensely important fact that putrefaction and fermentation are not the consequences of death but of life, and that without the presence of living *Bacteria* putrefaction does not occur, whilst he also is the discoverer of the fact that the yeast which causes alcoholic fermentation is a mass of unicellular living organisms.

Development of cell-theory.

From Schwann's time onward the cell became more and more the point of observation and experiment in the progress of both morphography and physiology. It was soon shown, chiefly through Kölliker and Remak, that all cells originate by fission from pre-existing cells,—a fact unknown to Schwann,—and the doctrine "omnis cellula e cellula" was established. It was also demonstrated that the Mammalian egg discovered by Von Baer was a typical nucleated cell, and that all animals, and plants also (this generalization took thirty years to establish), take their origin from an egg, which is in essence and in fact a single nucleated cell. The doctrine of Harvey, "omne vivum ex ovo," thus received its most ample justification. The study of "growth from the egg" became necessarily a study of the multiplication by fission of the egg-cell and its fission-products, their arrangement in layers, and the chemical metamorphosis of their substance and exudations. This study, as well as the allied investigation of the cell-structure of the adult tissues, was immensely facilitated by methods of hardening, staining, section-cutting, and clarifying which grew up after Schwann's time, and have their present highest development in the automatic microtome of Caldwell, which can be worked by a motor, and delivers consecutive sections of animal tissues or embryos $\frac{1}{4000}$th of an inch thick, arranged in the form of ribbons, ready for examination with the microscope, at the rate of one hundred or more per minute. Stricker of Vienna was the first to embed embryos in waxy material for the purpose of cutting thin sections of them, about twenty-five years ago, and R. Leuckart of Leipsic was subsequently the first to employ this method in the study of the structure of small *Invertebrata*.

The knowledge of the anatomical facts of cellular development and cellular structure necessarily gave immensely increased precision to the notion of gradation of structure in the animal series from simple to complex, and rendered Darwin's doctrine the more readily accepted. It was not, however, until after Darwin's date (1859) that the existence of unicellular animals was fully admitted, and the general facts of cellular embryology established throughout the animal kingdom.

Cellular physiology.

Similarly cellular physiology, by establishing the conception of a simple optically homogeneous cell-substance as the seat of the activities which we call "life," rendered it possible to accept the suggestion of a simple "substance of life" which might have been evolved from simpler non-living matter by natural processes depending on physical and chemical laws. It is noteworthy that Darwin himself appears not to have been influenced directly by any such physiological or chemico-physical doctrine as to "protoplasm" or cell-

substance. Nevertheless the way was prepared for the reception of Darwin's theory by this state of physiological knowledge.

Protoplasm. The word "protoplasm" requires a little further notice. Protoplasm was applied by Von Mohl and by Max Schultze to the slimy substance of the cell, including therein both the general thinner material and the nucleus. It is, as Roscoe remarked at Manchester (*Brit. Ass. Address*, 1887), a structure and not a chemical body. Nevertheless gradually physiologists have come to use the word "protoplasm" for *one* of the chemical substances of which Schultze's protoplasm is a structural mixture—namely, that highest point in the chemical elaboration of the molecule which is attained within the protoplasm, and up to which some of the chemical bodies present are tending, whilst others are degradation products resulting from a downward metamorphosis of portions of it. This intangible, unstable, all-pervading element of the protoplasm cannot at present be identified with any visibly separable part of the cell-substance, which consists of a hyaline denser network of excessive tenuity, of a less dense hyaline liquid, and of finest and less fine granules of varying chemical nature. This "critical" substance, sometimes called "true protoplasm," should assuredly be recognized by a distinct name "plasmogen," whilst protoplasm retains its structural connotation.

Plasmology. The study of the process of fertilization and of the significance in that process of the distinct parts of the sperm-cell and egg-cell—the separate fibrillæ granules of the nuclei of those cells—at the present moment forms one of the engrossing subjects of zoological investigation.[1] Not less important is the descent, as it were, of physiological investigation in relation to every organ into the arena of the cell: digestion, secretion, muscular contraction, nerve action, all are now questions of plasmology, or the study of cell-substance founded by Schwann.[2]

General Tendency of Zoology since Darwin.

Bionomics. The serious and broadly-based study of bionomics which was introduced by Darwin, and in his hands gave rise to the doctrine of natural selection, by which the hypothesis of the origin of species by gradual transmutation in the natural process of descent from ancestral forms was established as a scientific doctrine, can hardly be said to have had any history. Buffon (1707–1788) alone among the greater writers of the three past centuries emphasized that view of living things which we call "bionomics." Buffon deliberately opposed himself to the mere exposition of the structural resemblances and differences of animals, and, disregarding classification, devoted his treatise on natural history to a consideration of the habits of animals and their adaptations to their surroundings, whilst a special volume was devoted by him to the subject of reproduction. In special memoirs on this or that animal, and in a subordinate way in systematic works, material is to be found helping to build up a knowledge of bionomics, but Buffon is the only prominent writer who can be accorded historic rank in this study.[3] The special study of man in these relations—such as is concerned with the statistics of population—must be considered as having contributed very importantly to Darwin's wider study of bionomics in general. The work of Malthus *On Population* (1798) exercised the most important influence on Darwin's thought, as he himself tells us, and led him to give attention to the facts of animal population, and so to discover the great moving cause of natural selection—the struggle for existence. Darwin may be said to have founded the science of bionomics, and at the same time to have given new stimulus and new direction to morphography, physiology, and plasmology, by uniting them as contributories to one common biological doctrine—the doctrine of organic evolution—itself but a part of the wider doctrine of universal evolution based on the laws of physics and chemistry.

The full influence of Darwin's work upon the progress and direction of zoological study has not yet been seen. The *immediate* result has been, as pointed out above, a reconstruction of the classification of animals upon a genealogical basis, and an investigation of the individual development of animals in relation to the steps of their gradual building up by cell-division, with a view to obtaining evidence of their genetic relationships. On the other hand, the studies which occupied Darwin himself so largely subsequently to the publication of the *Origin of Species*, viz., the explanation of animal (and vegetable) mechanism, coloring, habits, etc., as advantageous to the species or to its ancestors—in fact, the new teleology,—has not yet been so vigorously pursued as it must be hereafter. The most important work in this direction has been done by Fritz Müller (*Für Darwin*), by Herman Müller (*Fertilization of Plants by Insects*), and by August Weismann (memoirs translated by Meldola). Here and there observations are from time to time published, but no large progress has yet been made, probably on account of the fact that animals are exceedingly difficult to keep under observation, and that there is no provision in universities and like institutions for the pursuit of these inquiries or even for their academic representation. More has been done with plants than with animals in this way since Darwin, probably owing to the same cause which has, ever since the revival of learning, given botany a real advantage over zoology, namely, the existence of "physick" gardens, now become "botanical" gardens, and the greater ease of management, experiment, and observation in the case of plants than in that of animals. It is true that zoological gardens have existed for the last fifty years in all large European cities, but these have always been conducted with a view to popular exhibition: and, even where scientific influences have been brought to bear on their management, they have been those of the morphographer and systematist rather than of the bionomist. Moreover, zoological gardens have never been part of the equipment of the university professor of zoology, as it may be hoped in future will be the case. The foundation of marine biological laboratories under the control of scientific zoologists offers a prospect of true bionomic observation and experiment on an increased scale in the near future, and, were such laboratories founded in our universities and provided with the necessary appliances for keeping terrestrial and freshwater animals, as well as marine forms, alive and under observation in conditions resembling as nearly as possible those of nature, a step would have been taken towards carrying on the study of bionomics which cannot long be delayed. It seems to be even more important that the academic curriculum of zoology should not, by mere mechanical adhesion to the old lines of morphography, and experimental research on the chemical and physical properties of tissues and organs, confine the attention and training of young students to what are now, comparatively speaking, the less productive lines of research.

Teleology.

If we turn to the other branch of bionomics, that concerned with the laws of variation and heredity (thremmatology), we find that since Darwin, and independently of his own work, there has been a more obvious progress than in teleology. In the first place, the continued study of human population has thrown additional light on some of the questions involved, whilst the progress of

Thremmatology.

[1] See the memoirs of Weismann on Heredity and F. M. Balfour's *Embryology*.

[2] For a fuller and general history of Physiology, see that article.

[3] The main literary sources made use of by Darwin are the magazines and treatises of horticulturists, farmers, pigeon-fanciers, and the like, in fact what is comprised in the *Field* newspaper.

microscopical research in the hands of Bütschli, Hertwig, Balfour, and August Weismann promises to give us a clear foundation as to the structural facts connected with the origin of the egg-cell and sperm-cell and the process of fertilization. This is not the fitting place in which to give a sketch of the doctrines and hypotheses of thremmatology. They may be gathered from Darwin's writings, more especially the *Origin of Species* and *Animals and Plants under Domestication*.[1] They relate to the causes of variation in animals and plants, the laws of the transmission of parental characters, the share of each parent in the production of the characters of the offspring, atavism, and the relations of young to parents as to number, sex, nourishment, and protection.

An important development of Darwin's conclusions is actually in progress and deserves special notice here, as it is the most distinct advance in the department of bionomics since Darwin's own writings, and at the same time touches questions of fundamental interest. The matter strictly relates to the consideration of the "causes of variation," and is as follows.

Variation.

The fact of variation is a familiar one. No two animals, even of the same brood, are alike; whilst exhibiting a close similarity to their parents, they yet present differences, sometimes very marked differences, from their parents and from one another. Lamarck had put forward the hypothesis that structural alterations acquired by a parent in the course of its life are transmitted to the offspring, and that, as these structural alterations are acquired by an animal or plant in consequence of the direct action of the environment, the offspring inheriting them would as a consequence not unfrequently start with a greater fitness for those conditions than its parents started with. In its turn, being operated upon by the conditions of life, it would acquire a greater development of the same modification, which it would in turn transmit to its offspring. In the course of several generations, Lamarck argued, a structural alteration amounting to such difference as we call "specific" might be thus acquired. The familiar illustration of Lamarck's hypothesis is that of the giraffe, whose long neck might, he suggested, have been acquired by the efforts of a primitively short-necked race of herbivores, who stretched their necks to reach the foliage of trees in a land where grass was deficient, the effort producing a distinct elongation in the neck of each generation, which was then transmitted to the next. This process is known as "direct adaptation"; and there is no doubt that such structural adaptations are acquired by an animal in the course of its life. Whether such acquired characters can be transmitted to the next generation is a separate question. It was not proved by Lamarck that they can be, and, indeed, never has been proved by actual observation. Nevertheless it has been assumed, and also indirectly argued, that such acquired characters *must* be transmitted. Darwin's great merit was that he excluded from his theory of development any *necessary* assumption of the transmission of acquired characters. He pointed to the admitted fact of congenital variation, and he showed that these variations to all intents and purposes have nothing to do with any characters acquired by the parents, but are arbitrary and, so to speak, non-significant. Their causes are extremely difficult to trace in detail, but it appears that they are largely due to a "shaking up" of the living matter which constitutes the fertilized germ or embryo-cell, by the process of mixture in it of the substance of two cells,—the germ-cell and the sperm-cell,—derived from two different individuals. Other mechanical disturbances may assist in this production of congenital variation. Whatever its causes, Darwin showed that it is all-important. In some cases a pair of animals produce ten million offspring, and in such a number a large range of congenital variation is possible. Since on the average only two of the young survive in the struggle for existence to take the place of their two parents, there is a selection out of the ten million young, none of which are exactly alike, and the selection is determined in nature by the survival of the congenital variety which is fittest to the conditions of life. Hence there is no *necessity* for an assumption of the perpetuation of direct adaptations. The selection of the fortuitously (fortuitously, that is to say, so far as the conditions of survival are concerned) produced varieties is sufficient, since it is ascertained that they will tend to transmit those characters with which they themselves were born, although it is *not* ascertained that they could transmit characters *acquired* on the way through life. A simple illustration of the difference is this: a man born with four fingers only on his right hand is ascertained to be likely to transmit this peculiarity to some at least of his offspring; on the other hand, there is not the slightest ground for supposing that a man who has had one finger chopped off, or has even lost his arm at any period of his life, will produce offspring who are defective in the slighest degree in regard to fingers, hand, or arm. Darwin himself, apparently influenced not merely by the consideration of certain classes of facts which seem to favor the Lamarckian hypothesis but also by a respect for the general prejudice in its favor and for Mr. Herbert Spencer's authority, was of the opinion that acquired characters are *in some cases* transmitted. It should be observed, however, that Darwin did not attribute an essential part to this Lamarckian hypothesis of the transmission of acquired characters, but expressly assigned to it an entirely subordinate importance.

Causes of congenital variation.

Transmission of acquired and inherited characters.

The new attitude which has been taken since Darwin on this question is to ask for evidence of this asserted transmission of acquired character. It is held[2] that the Darwinian doctrine of selection of fortuitous congenital variations is sufficient to account for all cases, that the Lamarckian hypothesis of transmission of acquired characters is not supported by experimental evidence, and that the latter should therefore be dismissed. Weismann has also ingeniously argued from the structure of the egg-cell and sperm-cell, and from the way in which, and the period at which, they are derived in the course of the growth of the embryo from the egg—from the fertilized egg-cell—that it is impossible (it would be better to say highly improbable) that an alteration in parental structure *could* produce any exactly representative change in the substance of the germ or sperm-cells.

It does not seem improbable that the doctrine of organic evolution will thus become pure Darwinism and be entirely dissociated from the Lamarckian heresy.

The one fact which the Lamarckians can produce in their favor is the account of experiments by Brown-Séquard, in which he produced epilepsy in guinea-pigs by section of the large nerves or spinal cord, and in the course of which he was led to believe that in a few rare instances the artificially produced epilepsy was transmitted. This instance does not stand the test of criticism. It is not clear whether the guinea-pigs operated upon had or had not already a constitutional tendency to epilepsy, and it is not clear in what proportion of cases the supposed transmission took place, and whether any other disease accompanied it. On the other hand, the vast number of experiments in the cropping of the tails and ears of domestic animals, as well as of similar operations on man, are attended with negative results. No case of the transmission of the results of an injury can be produced. Stories of tailless kittens, puppies, and calves, born from parents one of whom had been thus injured, are abundant, but they have hitherto entirely failed to stand before examination.

[1] The reader is also referred to Ribot's *L'Hérédité*, and the writings of Charles Darwin's cousin, Francis Galton.

[2] Weismann, *Vererbung*, etc., 1886.

Experimental researches on this question are most urgently needed, but they are not provided for either in the morphographical or physiological laboratories of our universities.

Whilst simple evidence of the fact of the transmission of an acquired character is wanting, the *a priori* arguments in its favor break down one after another when discussed. The very cases which are advanced as only to be explained on the Lamarckian assumption are found on examination and experiment to be better explained, or only to be explained, by the Darwinian principle. Thus the occurrence of blind animals in caves and in the deep sea was a fact which Darwin himself regarded as best explained by the atrophy of the organ of vision in successive generations through the absence of light and consequent disuse, and the transmission (as Lamarck would have supposed) of a more and more weakened and structurally impaired eye to the offspring in successive generations, until the eye finally disappeared. But this instance is really fully explained by the theory of natural selection acting on congenital fortuitous variations. Many animals are thus born with distorted or defective eyes whose parents have not had their eyes submitted to any peculiar conditions. Supposing a number of some species of Arthropod or Fish to be swept into a cavern or to be carried from less to greater depths in the sea,—those individuals with perfect eyes would follow the glimmer of light and eventually escape to the outer air or the shallower depths, leaving behind those with imperfect eyes to breed in the dark place. A natural selection would thus be effected. In every succeeding generation this would be the case, and even those with weak but still seeing eyes would in the course of time escape, until only a pure race of eyeless or blind animals would be left in the cavern or deep sea. Experiments by inquiries with regard to this subject are in progress; amongst those who have occupied themselves with it are August Weismann of Freiburg and E. B. Poulton of Oxford.

Theory of transmission of instincts.

It has been argued that the elaborate structural adaptations of the nervous system which are the corporeal correlatives of complicated instincts must have been slowly built up by the transmission to offspring of acquired experience, that is to say, of acquired brain structure. At first sight it appears difficult to understand how the complicated series of actions which are definitely exhibited as so-called "instincts" by a variety of animals can have been due to the selection of congenital variations, or can be otherwise explained than by the transmission of habits acquired by the parent as the result of experience, and continuously elaborated and added to in successive generations. It is, however, to be noted, in the first place, that the imitation of the parent by the young possibly accounts for some part of these complicated actions, and, secondly, that there are cases in which curiously elaborate actions are performed by animals as a characteristic of the species, and as subserving the general advantage of the race or species, which, nevertheless, can *not* be explained as resulting from the transmission of acquired experience, and must be supposed to be due to the natural selection of a fortuitously developed habit which, like fortuitous color or form variation, happens to prove beneficial. Mr. Poulton has insisted upon the habits of "shamming dead" and the combined posturing and color peculiarities of certain caterpillars (Lepidopterous larvæ) which cause them to resemble dead twigs or similar surrounding objects. The advantage to the animal of this imitation of surrounding objects is that it escapes the pursuit of (say) a bird which would, were it not deceived by the resemblance, attack and eat the caterpillar. Now it is clear that preceding generations of caterpillars cannot have acquired this habit of posturing by experience. Either the caterpillar postures and escapes, or it does not posture and is eaten; it is not half eaten and allowed to profit by experience. We seem to be justified in assuming that there are many movements of stretching and posturing possible to caterpillars, and that some caterpillars had a congenital fortuitous tendency to one position, some to another, and, finally, that among all the variety of habitual movements thus exhibited one has been selected and perpetuated because it coincided with the necessary conditions of safety, since it happened to give the caterpillar an increased resemblance to a twig.

The view that instinct is the hereditarily fixed result of habit derived from experience has hitherto dominated all inquiry into the subject, but we may now expect to see a renewed and careful study of animal instincts carried out with the view of testing the applicability to each instance of the pure Darwinian theory without the aid of Lamarckism.

The whole of this inquiry has special importance in regard to mankind, since the great questions of influence of race and family as opposed to the influence of education are at issue. If pure Darwinism is to be accepted, then education has no value in directly affecting the mental or physical features of the race, but only in affecting those of the individual. Were acquired characters really and fully transmitted, then every child born would inherit the knowledge of both its parents more or less completely, and from birth onwards would be able to add to its inherited stock, so that the progress of the race in mental acquirements would be prodigiously more rapid than it is. On the other hand, peculiarities of mind and body established in a race or a family acquire increased significance, for they cannot be got rid of by training, but are bound to reappear if the stock which exhibits them is allowed to breed. It seems that the laws of thremmatology may eventually give to mankind the most precise directions, not only as to how to improve the breeds of plants and animals, but as to how to improve the human stock. It is not a little remarkable that the latest development of zoological science should favor that respect to breeding which is becoming less popular than it was, and should tend to modify the current estimate of the results of education.

Relation of zoology to philosophy.

The relation of Darwinism to general philosophy and of the history of zoology to philosophical doctrines is one of the most interesting chapters which might be written on the subject of this article. It belongs, however, rather to the history of philosophy than to that of zoology. Undoubtedly the conceptions of mankind at different periods of history with regard to cosmogony, and the relations of God, nature, and man, have had a very marked influence upon the study of zoology, just as in its turn the study of zoology has reacted upon those conceptions.

Development of the idea of evolution.

In this, as in other phases of mental development, the ancient Greeks stand out in the most striking manner as possessing what is sometimes called the modern spirit. The doctrine of evolution is formulated in unmistakable terms by Heraclitus and other philosophers of antiquity. Not only so, but the direct examination of nature, including the various forms of animal life, was practiced by Aristotle and his disciples in a spirit which, though not altogether free from prejudice, was yet far more like that which actuated the founders of the Royal Society less than three hundred years ago than anything which was manifested in the two thousand years intervening between that date and the time of Alexander the Great. The study of zoology in the Middle Ages was simply a fantastic commentary on Aristotle and the records of animals in the various books of the Bible, elaborated as part of a peculiar system of mystic philosophy, which has more analogy with the fetichism and totem worship of savage races than with any Greek or modern conceptions. So far as philosophy affected the study of zoology in the be-

ginning of the modern period, its influence was felt in the general acceptance of what has been called Miltonic cosmogony,—namely, that interpretation of the Mosaic writings which is set forth by the poet Milton, and of which the characteristic is the conception of the creation of existing things, including living things, nearly or just as they are, by a rapid succession of "fiats" delivered by an anthropomorphic Creator. It was not until the end of the 18th century that Schelling (as quoted above) conceived that unity of nature and general law of development which is now called the doctrine of evolution.

In England Erasmus Darwin (*Zoonomia*, published in 1794–96), in France Lamarck (*Philosophie Zoologique*, 1809) and Geoffroy Saint-Hilaire (*Principes de Philosophie Zoologique*, 1830), and in Germany Oken (*Lehrbuch der Natur-Philosophie*, 1809–11), Goethe (*Zur Natur Wissensch.*, Stuttgart, 1817), and Treviranus (*Biologie*, 1802–5) were the authors of more or less complete systems of a philosophy of nature in which living things were regarded as the outcome of natural law, that is, of the same general processes which had produced the inanimate universe. The "Natur-philosophen" as they were called in Germany, demand the fullest recognition and esteem. But, just in proportion as the "Natur-philosophen" failed to produce an immediate effect on the study of zoology by their theory of natural development, so was the doctrine of evolution itself deprived of completeness and of the most important demonstration of its laws by the long-continued delay in the final introduction of biology into the area of that doctrine.

Darwin by his discovery of the mechanical principle of organic evolution, namely, the survival of the fittest in the struggle for existence, completed the doctrine of evolution, and gave it that unity and authority which was necessary in order that it should reform the whole range of philosophy. The detailed consequences of that new departure in philosophy have yet to be worked out. Its most important initial conception is the derivation of man by natural processes from ape-like ancestors, and the consequent derivation of his mental and moral qualities by the operation of the struggle for existence and natural selection from the mental and moral qualities of animals. Not the least important of the studies thus initiated is that of the evolution of philosophy itself. Zoology thus finally arrives through Darwin at its crowning development: it touches and may even be said to comprise the history of man, sociology, and psychology.

Bibliography. — Engelmann, *Bibliotheca Historico-Naturalis*, vol. i., 1846 (being a list of the separate works and academical memoirs relating to zoology published between 1700 and 1846); Carus and Engelmann, *Bibl. Zoologica*, Leipsic, 1861 (a similar list of works published between 1846 and 1861; J. V. Carus, *Gesch. d. Zoologie*, Munich, 1872; and L. Agassiz, *An Essay on Classification*, London, 1859.

(E. R. L.)

ZOROASTER, one of the great teachers of the East, the founder of what was the national religion of the Perso-Iranian people from the time of the Achæmenidæ to the close of the Sasanian period. The name (Ζωροάστρης) is the Greek form of the old Iranian *Zarathushtra* and the new Persian *Zardusht;* it seems to mean "possessor of old camels."

Zoroaster was already famous in classical antiquity as the founder of the widely renowned wisdom of the Magi. The later Greek writers place him with almost one consent in the east of Iran, and more particularly in Bactria. The name is not mentioned by Herodotus in his sketch of the Medo-Persian religion (i. 131 *sq.*), but it occurs in a fragment (29) of the earlier writer Xanthus. Plato calls Zoroaster the founder of the doctrine of the Magi and a son of Oromazes. According to Hermodorus, one of Plato's disciples, he was a Persian, the first Magian; according to Hermippus, a Bactrian; according to Trogus Pompeius, even king of the Bactrians and founder of the Magian art and knowledge of the stars; according to Diodorus, an Arian, that is, a native of east Iran. A few details as to his life are also given. Thus, according to Pliny, he laughed on the very day of his birth—a statement found also in the *Zardusht-Nâma*—and for thirty years he lived in the wilderness upon cheese. Plutarch speaks of his intercourse with the deity and compares him with Lycurgus and Numa. Dio Chrysostom, Plutarch's contemporary, declares that neither Homer nor Hesiod sang of the chariot and horses of Zeus so worthily as Zoroaster, of whom the Persians tell that out of love to wisdom and righteousness he withdrew himself from men and lived in solitude upon a mountain. The mountain was burnt up, but Zoroaster escaped uninjured and spoke to the multitude. His struggle with Semiramis seems to be an invention of Ctesias. Plutarch, drawing partly on Theopompus, speaks of his religion in his *Isis and Osiris* (cc. 46 and 47).

Ancient writers differ greatly as to Zoroaster's date. Ctesias, as we have seen, makes him a contemporary of Semiramis. Hermippus of Smyrna places him 5000 years before the Trojan War, Xanthus 6000 years before Xerxes. Aristotle assigned him a similar antiquity. Agathias remarks (ii. 24) with perfect truth that it is no longer possible to determine with any certainty when he lived and legislated. "The Persians," he adds, "say that Zoroaster lived under Hystaspes, but do not make it clear whether by this name they mean the father of Darius or another Hystaspes. But, whatever may have been his date, he was their teacher and instructor in the Magian religion." All classical antiquity, however, without a dissentient voice speaks of Zoroaster as an historical person.

He is nowhere mentioned in the cuneiform inscriptions of the Achæmenidæ, although Darius and his successors were without doubt devoted adherents of Zoroastrianism. Very little value can be attached to the fabulous narratives concerning him in the later Persian and Parsee literature, the *Shâh-Nâma* and the *Zardusht-Nâma* (13th century); and the information of the Pahlavi books is very scanty. The Zend-Avesta alone gives abundant details, which in part at least, may be regarded as authentic.

Before proceeding to compile from these a brief sketch of the life and doctrine of Zoroaster it will be well that we should first look at the question whether we are entitled to regard him as an historical character at all. For Zoroaster too, like his great fellow-teacher Buddha, has fallen under the ban of modern skepticism. According to Darmesteter and Eduard Meyer, the Parsee saint is a mere myth, a divinity invested with human attributes, an incarnation of the storm-god, who with his divine word, the thunder, comes down from heaven, and smites the demons. Darmesteter, however, has failed to realize sufficiently the distinction between the Zoroaster of the later Avesta and the Zoroaster of the Gâthâs. It cannot be denied that in the later Avesta, and still more in writings of more recent date, he is presented in a supernatural light and invested with superhuman powers. At his appearing all nature rejoices (*Yasht* 13, 93); he enters into conflict with the demons and rids the earth of their presence (*Yasht* 17–19); Satan approaches him as tempter to make him renounce his faith (*Vd.*, 19, 6). The *Zardhust-Nâma* is full of miracles and miraculous deliverances wrought by Zoroaster. But it is quite otherwise in the Gâthâs.

The Gâthâs alone within the Avesta make any claim to be the *ipsissima verba* of the prophet; in the rest of that work they are put into Zoroaster's own mouth (*Yasna*, 9, 1) and are expressly called "the Gâthâs of the holy Zoroaster" (*Yasna*, 57, 8). The litanies of the Yasna, and the Yashts, refer to him as a personage belonging to a remote antiquity. The

Vendidad also merely gives accounts of the dialogues between Ormuzd and Zoroaster. The Gâthâs alone claim to be authentic utterances of Zoroaster, his genuine expressions in presence of the assembled church.

The person, too, of the Zoroaster whom we meet with in these hymns differs *toto cœlo* from the Zoroaster of the younger Avesta. He is the exact opposite of the miraculous personage of later legend,—a mere man, standing always on the solid ground of reality, whose only arms are trust in his God and the protection of his powerful allies. And at times his position is precarious enough. He whom we hear in the Gâthâs has had to face, not merely all forms of outward opposition and the unbelief and lukewarmness of adherents, but also the inward misgivings of his own heart as to the truth and final victory of his cause. At one time hope, at another despondency, now assured confidence, now doubt and despair, here a firm faith in the speedy coming of the kingdom of heaven, there the thought of taking refuge by flight,—such is the range of the emotions which find their immediate expression in these hymns. And the whole breathes such a genuine originality, all is psychologically so accurate and just, the earliest beginnings of the new religious movement, the childhood of a new community of faith, are reflected so naturally in them all, that it is impossible for a moment to think of a later period of composition by a priesthood whom we know to have been devoid of any historical sense, and incapable of reconstructing for themselves the spiritual conditions under which Zoroaster lived. As soon as the position has been fully mastered—that in the Gâthâs we have firm historical ground on which Zoroaster and his surroundings may rest, that here we have the beginnings of the Zoroastrian religion—then it becomes impossible to answer otherwise than affirmatively every general question as to the historical character of Zoroaster. On the other hand, we must not expect too much from the Gâthâs in the way of definite detail. They give no historical account of the life and teaching of their prophet, but rather are, so to to say, *versus memoriales*, which recapitulate the main points of interest, often again in an allusive way. It must be remembered too that their extent is but limited.

As to the birthplace of Zoroaster the Avesta is silent. In later tradition two places contended for this honor: the older and more widely spread story made him a native of Rai (Rhagæ) in Media, another of Shîz, the capital of Atropatene, also in Media. It is hard to decide whether both traditions rest merely upon priestly pretensions of a later date or whether one of them is not perhaps authentic. According to *Yasna*, 19, 18, the "zarathushtrotema" or supreme head of the Zoroastrian priesthood had at a later (Median or Sasanian?) time his residence in Rhagæ. But there is a passage in even the Gâthâs (*Y.*, 53, 9) which seems to contain a lurking allusion to Rhagæ; unfortunately, however, both text and meaning are uncertain. However this may be, the activity of Zoroaster as a teacher is certainly to be placed in the east of Iran. On this point also the Gâthâs say nothing. The later Avesta names, as the locality of his advent, "Airyanem vaêjô," a quite fabulous country, which, according to *Vd.*, 1, 3, and 7, was not identified with Baetria. He taught under the reign of a ruler named Vîshtâspa (later Gushtâsp, the Greek Hystaspes), with whom and with whose court he stood in close and friendly relations. This Vîshtâspa must be carefully distinguished from Hystaspes the father of Darius. According to the epic legend, Vîshtâspa was king of Baetria. Already in the later Avesta he has become a half mythical figure, the last in the series of heroes of east Iranian legend, in the arrangement of which series priestly influence is unmistakably evident. He stands at the meeting-point between the old-world and the new era which begins with Zoroaster. In the Gâthâs he appears as a quite historical personage; it is essentially to his power and good example that the prophet is indebted for his success. In *Yasna*, 53, 2, he is spoken of as a pioneer of the doctrine revealed by Ormuzd. In the relation between Zoroaster and Vîshtâspa already lies the germ of the state church which afterwards became so completely subservient to the interests of the dynasty and sought its protection from it.

Among the grandees of the court of Vîshtâspa mention is made of two brothers, Frashaoshtra and Jâmâspa; the latter, according to the later legend, was the minister of Vîshtâspa. Zoroaster was nearly related to both; his wife Hvôvi seems to have been their sister, and the husband of her daughter, Pouruchista, was a son of Jâmâspa. Apart from this connection, the new prophet relies especially upon his own kindred (*hvaêtush*) and their followers (*airyaman*). His first disciple, Maidhyôimâongha, was a relation; his father was, according to the later Avesta, Pouroushaspa, his great-grandfather Haêcataspa, and the ancestor of the whole family Spitama, for which reason Zarathushtra usually bears this surname. His sons and daughters are repeatedly spoken of. His death is, for reasons easily intelligible, nowhere mentioned in the Avesta; in the *Shâh-Nâma* he is said to have been murdered at the altar by the Turanians in the storming of Balkh.

We are quite in the dark as to the date of Zoroaster; King Vîshtâspa has no place in any historical chronology, and the Gâthâs give no hint on the subject. But at any rate he must have lived long before Cyrus, by whose time the new religion had already become established in western Iran (Nic. Damasc., fr. 66). Duncker places him about the year 1000 B.C. Merely conjectural also is the opinion once orally expressed by Gutschmid that Zoroaster may have been a contemporary of Moses, thus belonging, according to Gutschmid's view, to about the 14th century B.C.,—a period of great religious activity throughout western Asia.

It was a new religion that Zoroaster taught. This must not, however, be taken as meaning that everything he taught came, so to say, out of his own head. His doctrine was a product of the time, and had its roots in the nature and history of the people to which he belonged. Usually he is spoken of as a reformer of the old Iranian faith. But in order to be sure of this it would be necessary first to know something about the nature of that faith as it existed before he arose. Was it still essentially the same as that of the nearly-allied ancient Hindus, as found in the *Rig-Veda?* To this question no distinct answer is forthcoming; we are ignorant as to how far the way had been prepared for Zoroastrianism or how far it was wholly new. But still there is room for conjecture as to what it was that gave the prophet the first impulse and occasion for his work.

The most striking difference between Zoroaster's doctrine of God and the old religion of India lies in this, that, while in the Avesta the evil spirits are called *daêva* (Modern Persian *dîv*), the Aryans of India, on the other hand, in common with the Italians, Celts, and Letts, gave the name of *dêva* to their good spirits, the spirits of light. An alternative designation for deity in the *Rig-Veda* is *asura*. In the more recent hymns of the *Rig-Veda* and in later India, on the other hand, only *evil* spirits are understood by *asurâs*, while in Iran the corresponding word *ahura* was, and ever has continued to be, the designation of God the Lord, especially of the supreme God, with the epithet of *Mazdâo* (the Wise). Thus *ahura-daêva*, *dêva-asura* in Zoroastrian and in later Brahman theology are in their meanings exactly opposed. This difference no one has as yet satisfactorily accounted for, and yet it supplies the key to the doctrine of Zoroaster.

The difference proceeded from an old distinction between the ideas *deva* and *asura*. An original ideal difference, a different conception of god associated with the two words, grew in the two lands into a sharp antithesis, a formal conflict, but in opposite senses. In India the development still admits of being traced. In the older *Rig-Veda* the difference is latent. Here a god is spoken of as *dêva*, but not every *dêva* is an *asura*. *Asura* is something which is attributed only to certain particular gods as a special attribute, notably to Varuna, though also to others, such as Indra, but only by the so-called "kathenotheism" of the Vedic religion. On the other hand, it is expressly stated

that in the case of Indra the dignity of an *asura* was only a conferred one (*Rig-V.*, 6, 10, 2). In *Rig-Veda*, 4, 42 Varuna claims as against Indra the priority in the *asura* dignity. This hymn, like 10, 124, is of importance for the whole question. The contrast there implied between Varuna and Indra, the rivalry between them as to which is the greater, comes to light sometimes more strongly, sometimes less so, throughout the entire *Rig-Veda*. The contrast is really in other terms the old contrast between *asura* and *deva*, between a more spiritualistic and a more materialistic conception of deity. *Asura* is ethically the higher conception, *deva* the lower: *deva* is the vulgar notion of God, *asura* is theosophic. The supersensuous figure of Varuna is the type of an *asura*, the sensuous figure of Indra the type of a *deva*. In the *Rig-Veda*, Varuna, the old king of the gods, is going down, while Indra, the popular national god, is in the ascendant. Along with Varuna, but in a still higher degree, the very conception of *asura* goes down; it becomes unmodern, obsolete, and acquires an undesirable flavor. The *asuras* thus come to form a distinct group of celestial beings mentioned along with the *devas* (*A.-V.*, 10, 10, 26); they become in rank inferior to the *devas* (*A.-V.*, 6, 86, 3) and receive the designation of *asurâ adevâs* —*asuras* that are no *devas;* and from this it is but a short step to the "*asuras* that are opposed to the gods."

The old contrast between *asura* and *deva* was wrought out and accentuated quite differently on Iranian soil. While in India the entire revolution took place in a bloodless manner wholly within the realm of ideas, the old antithesis led to an open quarrel among the Aryans of Iran. In the background of the picture of Zoroaster's times set before us in the Gâthâs we see the people divided between two opposing and hostile cults, the watchwords of which are *ahura* on the one hand and *daêva* on the other. How it is that matters had come to this pass remains obscure, for we have no source of information to take us further back. The opposing parties are not separated by distance in space or by differing nationality, but occur side by side. "Hard by the believer in *ahura* dwells the worshipper of the *daêvas*," complains Zoroaster. The entire people seems broken up by the religious difference.

It is difficult to focus the scattered references in the Gâthâs so as to obtain a clear picture of the time. Only this much is clear, that in Zoroaster's day not two cults only, but two stages of culture are struggling for the mastery. The *ahura* worshippers represent the higher phase; they are breeders of cattle, and the care of the cow is to them a sacred duty. The worshippers of the *daêvas* maltreat the animal and slaughter it in their sacrifices. We perceive that the higher ethical tendency of the old *asura* faith is producing its effects in the higher degree of culture of the believers in Ahura, while the worshippers of the *daêvas* stand on a lower grade.

It is to this period of religious ferment that Zoroaster's appearance on the scene belongs. It is not he who has evoked this religious conflict of parties, as the common assumption is, and just as little is it he who in Ahura with the epithet of Mazdâo offers a new god to his people. He strikes decisively into the existing struggle, mounts to the position of spiritual leader of the *ahura* party and makes the battle a victory. As *zaotâ* (Indian *hotâ*), for so he calls himself, the first in rank of the old Aryan priests, he had all the greater opportunity to make his views known in matters of religion. Mankind had been brought face to face with a critical choice, that of electing between two radically opposed confessions of faith, without having any clearness as to the lasting consequences of the momentous step. He determines to save them, to lead them to a right choice, for he sees further than they, and believes himself to be initiated into the secrets of the godhead and of the life to come. What the other party worship as gods under the name of *daêva* are in reality powers by whom unwitting mankind are led to their destruction,—evil powers, false gods, devils. Such is the position from which all his teaching starts; and thus the change in the conception of *daêva* was a natural development. From the *daêvas* proceeds all the evil in the world. But his speculation does not stop here. The *daêvas* themselves anon become manifest to him as being but the instruments of a higher principle, called by him for the most part *Druj* (falsehood, deception), and more rarely *Angrô Mainyush*, that is the spirit enemy, Ahriman. This Ahriman or evil principle is the most characteristic product of Zoroastrian speculation. From the schism or religious dualism of his time he derived the idea of that dualistic scheme of the universe which has impressed its character upon the whole of the religion called by his name.

Zoroastrian Doctrine.

The fundamental idea of the Zoroastrian creed is dualistic. At the beginning of things there existed two spirits —Ahurô Mazdâo (Ormuzd) and Angrô Mainyush (Ahriman) —who represented good and evil (*Yasna*, 30, 3). The existence of evil in the world is thus presupposed from all eternity. Both spirits possess creative power, which manifests itself in the one positively and in the other negatively. Ormuzd is light and life and all that is pure and good,—in the ethical world law, order, and truth; his antithesis is darkness, filth, death, all that is evil in the world, lawlessness and lies. When the two are spoken of as *yêma* ("a pair"), this is not to be interpreted as meaning that they are twins:[1] it simply denotes a duality, an opposed couple, a *dvandva*. The two spirits had until then counterbalanced one another. The ultimate triumph of the good spirit is an ethical demand of the religious consciousness and the quintessence of Zoroaster's revelation.

The evil spirit with his wicked hosts appears in the Gâthâs much less endowed with the attributes of personality than does Ahura Mazda. Within the world of the good Ormuzd is Lord and God alone. In this sense Zoroastrianism is often referred to as the faith of Ormuzd or as Mazdaism. Ormuzd in his exalted majesty is the ideal figure of an Oriental king. Of other gods beside him the doctrine of the Gâthâs knows nothing. The natural and symbolical gods of the popular belief have no place in it. Yet Ormuzd is not alone in his doings and conflicts, but has in conjunction with himself a number of genii—for the most part personifications of ethical ideas. These are his creatures, his instruments, servants, and assistants, like the ministers of an autocratic sovereign. They are comprehended under the general name of *ameshâ spentâ* ("immortal holy ones") and are the prototypes of the seven *amshaspands* of a later date. These are—(1) Ashem, afterwards Ashem Vahishtem (Plutarch's ἀλήθεια), corresponding to all that is true, good, and right,—ideas practically identical for Zoroaster, and the embodiment of all that is true, good, and right, upright law and rule; (2) Vohu Manô (εὔνοια), good sense, *i.e.*, the good principle, the idea of the good, the principle that works in man inclining him to what is good; (3) Khshathrem, afterwards Khshathrem Vairîm (εὐνομία), the power and kingdom of Ormuzd, which have subsisted from the first, but not in integral completeness, the evil having crept in like the tares among the wheat: the time is yet to come when it shall be fully manifested in all its unclouded majesty; (4) Armaiti (σοφία), or the spirit of docility and obedience, spoken of as daughter of Ormuzd and regarded as having her abode upon the earth; (5) Haurvatât (πλοῦτος), perfection; (6) Ameretatât, immortality. Other ministering angels are Gêush Tashan ("the creator of the cow"), Gêush Urvan ("the genius and defender of animals"), and the holy spirit of Ormuzd, often thought of as having personal existence. Of the elements fire alone ("the son of Ahura Mazda") receives personification and figures as his ally.

As soon as the two at first absolutely separate spirits (comp. *Bundahish*, 1, 4) encounter one another, their creative activity and at the same time their permanent conflict begin. The history of this conflict is the history of the world. A great cleft runs right through the world: all creation divides itself into that which is Ahura's and that which is Ahriman's. Not that the two spirits carry on the struggle in person; they leave it to be fought out by their respective creations and creatures which they send into the field. The field of battle is the present world.

[1] Later sects sought to rise from the dualism to a higher unity. Thus the Zarvanites represented Ormuzd and Ahriman as twin sons proceeding from the fundamental principle of all, Zrvana Akarana, or limitless time.

In the centre of battle is man; his soul is the object of the war. Man is a creation of Ormuzd, who therefore has the right to call him to account. But Ormuzd created him free in his determinations and in his actions, wherefore he is accessible to the influences of the evil powers. This freedom of the will is clearly expressed in *Yasna*, 31, 11: "Since thou, O Mazda, didst at the first create our being and our souls in accordance with thy mind, and didst create our understanding and our life together with the body, and works and words in which man according to his own will can frame his confession, the liar and the truth-speaker alike lay hold of the word, the knowing and the ignorant each after his own heart and understanding. Armaiti searches, following thy spirit, where errors are found." Man takes part in this conflict by all his life and activity in the world. By a true confession of faith, by every good deed, by continually keeping pure his body and his soul, he impairs the power of Satan and strengthens the might of goodness, and establishes a claim for reward upon Ormuzd; by a false confession, by every evil deed and defilement, he increases the evil and renders service to Satan.

The life of man falls into two parts,—its earthly portion and that which is lived beyond the grave. The lot assigned to him after death is the result and consequence of his life upon earth. No religion has so clearly grasped the ideas of guilt and of merit. On the works of men here below a strict reckoning will be held in heaven (according to later representations by Rashnu and Mithra). All thoughts, words, and deeds of each are entered in the book as separate items (*dâthra*, *Y.*, 31, 14; *Vend.*, 19, 27), all the evil works as debts (*ishudô*). Wicked actions cannot be undone, but in the heavenly account can be counterbalanced by a surplus of good works. It is only in this sense that an evil deed can be atoned for by a good one. Of a remission of sins the doctrine of Zoroaster knows nothing. After death the soul arrives at the *cinvato peretush*, or accountant's bridge, over which lies the way to heaven. Here the statement of his life account is made out. If he has a balance of good works in his favor, he passes forthwith into paradise (*Garó demâna*) and the blessed life. If his evil works outweigh his good he falls finally under the power of Satan, and the pains of hell are his portion forever. Should the evil and the good be equally balanced, the soul passes into an intermediate stage of existence (the *Hamêstakâns* of the Pahlavi books) and his final lot is not decided until the last judgment. This court of reckoning, the *judicium particulare*, is called *âka*. The course of inexorable law cannot be turned aside by any sacrifice or offering, nor yet even by the free grace of God.

But man has been smitten with blindness and ignorance; he knows neither the eternal law nor the things which await him after death. He allows himself only too easily to be ensnared by the craft of the evil powers who seek to ruin his future existence. He worships and serves false gods, being unable to distinguish between truth and lies. Therefore it is that Ormuzd in his grace determined to open the eyes of mankind by sending a prophet to lead them by the right way, the way of salvation. According to later legend (*Vd.*, 2, 1), Ormuzd at first wished to entrust this task to Yima, (Jemshîd), the ideal of an Iranian king. But Yima, the secular man, felt himself unfitted for it and declined it. He contented himself therefore with establishing in his paradise (*vara*) a heavenly kingdom in miniature, to serve at the same time as a pattern for the heavenly kingdom that was to come. Zoroaster at last, as being a spiritual man, was found fit for the mission. Zoroaster experienced within himself the inward call to seek the amelioration of mankind and their deliverance from everlasting ruin, and regarded this inward impulse, intensified as it was by means of dreams and visions, as being the call addressed to him by God Himself. Like Mohammed after him he often speaks of his conversations with God. He calls himself most frequently *manthran* ("prophet"), *ratu* ("spiritual authority"), and *saoshyant* (meaning "he who will deliver," that is to say, when men come to be judged according to their deeds.)

The full contents of his dogmatic and ethical teaching we cannot gather from the Gâthâs. He speaks for the most part only in general references of the divine commands and of good and evil works. Among the former those most inculcated are renunciation of Satan, adoration of Ormuzd, purity of soul and body, and care of the cow. We learn little otherwise regarding the practices connected with his doctrines. A ceremonial worship is hardly mentioned. He speaks more in the character of prophet than in that of lawgiver. The contents of the Gâthâs are essentially eschatological. Revelations concerning the last things and the future lot, whether bliss or woe, of human souls, promises for true believers, threatenings for misbelievers, his firm confidence as to the future triumph of the good—such are the themes continually dwelt on with endless variations.

It was not without special reason, Zoroaster believed, that the calling of a prophet should have taken place precisely when it did. It was, he held, the final appeal of Ormuzd to mankind at large. Like John the Baptist and the Apostles of Jesus, Zoroaster also believed that the fulness of time was near, that the kingdom of heaven was at hand. Through the whole of the Gâthâs runs the pious hope that the end of the present world is not far off. He himself hopes along with his followers to live to see the decisive turn of things, the dawn of the new and better æon. Ormuzd will summon together all his powers for a final decisive struggle and break the power of evil forever; by his help the faithful will achieve the victory over their detested enemies, the *daêva* worshippers, and render them powerless. Thereupon Ormuzd will hold a *judicium universale* (*vîdâiti*) upon all mankind and judge strictly according to justice, punish the wicked, and assign to the good the hoped-for reward. Satan will be cast, along with all those who have been delivered over to him to suffer the pains of hell, into the abyss where he will thenceforward lie powerless. Forthwith begins the one undivided kingdom of God in heaven and on earth. This is called, sometimes the good kingdom, sometimes simply the kingdom. Here the sun will forever shine, and all the pious and faithful will live a happy life, that no evil power can disturb, in the fellowship of Ormuzd and his angels forever.

Zoroaster's teachings show him to have been a man of a highly speculative turn, faithful, however, with all his originality, to the Iranian national character. With zeal for the faith, and boldness and energy, he combined diplomatic skill in his dealings with his exalted protectors. His thinking is consecutive, self-restrained, practical, devoid on the whole of all that might be called fantastic and excessive. His form of expression is tangible and concrete. His system is constructed on a clearly conceived plan.

History and Later Development of Zoroastrianism.—For the great mass of the people Zoroaster's doctrine was too abstract and spiritualistic. Popular faith instinctively and naturally turns to concrete plastic forms of godhead borrowed from surrounding nature, and thus it came to pass that a number of the old Aryan divinities, whom the new teaching had driven into the background, were again restored to their former rank,—especially Mithra, the sun-god. Besides him, in the younger Avesta, Anâhita (Anâitis), the goddess of the waters, Tishtrya (Sirius), and other heavenly bodies are invoked with special preference. The Gâthâs know nothing of a new belief which afterwards arose in the *fravashi*, or guardian angels of the faithful. *Fravashi* properly means "confession of faith," and when personified comes to be regarded as a protecting spirit. Unbelievers have no *fravashi*.

On the basis of the new teaching arose a widely spread priesthood (*âthravannô*) who systematized the doctrines, organized and carried on the worship, and laid down the minutely elaborated laws for the purifying and keeping pure of soul and body which are met with in the Vendidad. To the last named belong in particular the numerous ablutions, bodily chastisements, love of truth, agriculture, protection of useful animals, as dogs and cattle, the destruction of noxious animals, and the prohibition either to burn or to bury the dead. In the worship the drink prepared from the *haoma* (Indian *soma*) plant had a prominent place. The last things and the end of the world are relegated to the close of a long period of time (3000 years after Zoroaster), when a new Saoshyant is to be born of the seed of Zoroaster, the dead are to come to life, and a new incorruptible world to begin.

The religion of Zoroaster, broadly speaking, never spread beyond the limits of Iran, although some isolated Turanian stems can be reckoned among those who profess it. From the East it doubtless passed in the first instance into Media and thence into Persia proper (comp. PERSIA, vol. xviii. p. 576). In the Persians of Herodotus's time we still see the new proselytes who have indeed accepted the creed, but not yet without reserve all the religious usages which accompany it, and least of all those which run completely counter to sacred and immemorial traditions of their time-honored customs. According to Herodotus (i. 140), they still refrained from exposing, at least from openly exposing, their dead to dogs and vultures, but continued to bury them. This was practiced by the Magi only, that is, by the priesthood, in conformity with the priestly laws. The Persians, however, made so far a concession to their adopted religion that they enveloped their dead bodies in wax, so that the earth might not be defiled.

After the fall of the Achæmenidæ (331 B.C.) Zoroastrianism lost greatly in power and dignity. It was subsequently re-

habilitated, however, by the Sasanians, under whom it reached its highest prosperity. Protected by this dynasty, the priesthood developed into a completely organized state church, which was able to employ the power of the state in enforcing strict compliance with the religious law-book hitherto enjoined by their unaided efforts only. The formation of sects was at this period not infrequent (comp. MANICHÆISM). The Mohammedan invasion (636), with the terrible persecutions of the following centuries, was the death-blow of Zoroastrianism. In Persia itself only a few followers of Zoroaster are now found (in Kirman and Yazd). The PARSEES (*q.v.*) in and around Bombay hold by Zoroaster as their prophet and by the ancient religious usages, but their doctrine has reached the state of a pure monotheism.

Literature.—See under ZEND-AVESTA; also Windischmann, *Zoroastriche Studien*, Berlin, 1863. (K. G.)

ZOSIMUS, a Greek historical writer, held public office (Photius describes him as "comes et exadvocatus fisci") at Constantinople some time in the first half of the 5th century. His *History*, which is mainly a compilation from previous authors (Herennius Dexippus, Eunapius, Olympiodorus), consists of six books: the first sketches very briefly the history of the early emperors from Augustus to Diocletian (305); the second, third, and fourth deal more copiously with the period from the accession of Constantius and Galerius to the death of Theodosius; the fifth and sixth cover the period between 395 and 410. The work is apparently unfinished. The style is characterized by Photius as concise, clear, and pure. The historian's object was to account for the decline of the Roman empire from the pagan point of view, and in this undertaking he has at various points treated the Christians with some unfairness.

A Latin version of the *History* was published by Leunclavius in 1576 (Basel, fol.), and in 1581 H. Stephanus added the Greek text of the first two books to his editon of Herodian. All the six books were published by Sylburgius in vol. iii. of his *Romanæ Historiæ Scriptores Græci Minores* (Frankfort, 1590). There have been several subsequent editions; that of Reitemeier (Leipsic, 1784) was re-edited by Bekker for Niebuhr's *Corpus Scriptorum Historiæ Byzantinæ* (Bonn, 1837). Zosimus was translated into French by Cousin in 1678; into English, anonymously, in 1684; and into German by Seybold and Heyler in 1804–5.

ZOSIMUS, bishop of Rome from 18th March, 417, to 25th December, 418, succeeded Innocent I. and was followed by Boniface I. For his attitude in the Pelagian controversy, see PELAGIUS (vol. xviii. pp. 482–3). He took a decided part in the protracted dispute in Gaul as to the jurisdiction of the see of Arles over that of Vienne, giving energetic decisions in favor of the former, but without settling the controversy.

ZOSTEROPS,[1] originally the scientific name of a genus of birds founded by Vigors and Horsfield (*Trans. Linn. Society*, xv. p. 235) on an Australian species called by them *Z. dorsalis*, but subsequently shown to be identical with the *Certhia cærulescens*, and also with the *Sylvia lateralis*, previously described by Latham. Latterly the name has been Anglicized in the same sense, and, whether as a scientific or a vernacular term, applied to a great number of species[2] of little birds which inhabit for the most part the tropical districts of the Old World, from Africa to most of the islands in the Indian and Pacific Oceans, and northwards in Asia through India and China to Amurland and Japan.

The birds of this group are mostly of unpretending appearance, the plumage above being generally either mouse-colored or greenish olive; but some are sufficiently varied by the white or bright yellow of their throat, breast, or lower parts, and several have the flanks of a more or less lively bay. It is remarkable that several islands are inhabited by two perfectly distinct species, one belonging to the brown and the other to the green section, the former being wholly insular. The greater number of species seem to be confined to single islands, often of very small area, but others have a very wide distribution, and much interest has been excited by the undoubted fact that the type-species, *Z. cærulescens* has of late years largely extended its range. First described from New South Wales, where it is very plentiful, it had been long known to inhabit all the eastern part of Australia. In 1856 it was noticed by naturalists as occurring in the South Island of New Zealand, when it became known to the Maories by a name signifying "Stranger," and to the English settlers as the "Blight-bird,"[3] from its clearing the fruit-trees of a blight by which they had lately been affected. It soon after appeared in the North Island, where it speedily became common, and it has thence not only spread to the Chatham Islands, but, as Sir Walter Buller states (*Birds N. Zealand*, ed. 2, i. p. 79), it has been met with in considerable numbers 300 miles from land, as though in search of new countries to colonize. Yet this author believes it to be indigenous to the west coast of the South Island, and Sir James Hector joins in that opinion. If they be right, it is, however, pretty certain that until the year before mentioned it must have been confined to an extremely small district, and the only assignable cause of its spreading so rapidly, when it did extend its range, is that of a large surplus population unable to find a living at home. It is known to propagate at a high rate of increase, and at times numbers have been found dead, apparently for want of food. In any case it is obvious that this Zosterops must be a comparatively modern settler in New Zealand.[4]

All the species of Zosterops are sociable, consorting in large flocks, which only separate on the approach of the pairing season. They build nests, described as being variously placed—sometimes suspended from a horizontal fork and sometimes fixed in an upright crotch—and lay (so far as is known) pale blue, spotless eggs, thereby differing wholly from several of the groups of birds to which they have been thought allied. Though mainly insectivorous, the birds of this genus will eat fruits of various kinds and in such quantities as to be at times injurious. The habits of *Z. cærulescens* have been well described by Sir W. Buller (*ut supra*), and those of a species peculiar to Ceylon, *Z. ceylonensis*, by Col. Legge (*B. Ceylon*, p. 586), while those of the widely-ranging Indian *Z. palpebrosa* and of the South African *Z. capensis* have been succinctly treated by Jerdon (*B. India*, ii. p. 266) and Mr. Layard (*B. South Africa*, p. 116) respectively.

It is a remarkable and, if capable of explanation, would doubtless be an instructive fact that the largest known species of the genus, *Z. albigularis*, measuring nearly 6 inches in length, is confined to so small a spot as Norfolk Island, where also another, *Z. tenuirostris*, not much less in size, occurs; while a third, of intermediate stature, *Z. strenua*, inhabits the still smaller Lord Howe's Island. A fourth, *Z. vatensis*, but little inferior in bulk, is found on one of the New Hebrides; but, after these giants of their kind, the rest fall off considerably, being from one-fifth to one-third less in length, and some of the smaller species hardly exceed 3½ inches from end to end.

The affinities of the genus *Zosterops* are by no means clear. Placed by some writers, if not systematists, with the *Paridæ* (*cf.* TITMOUSE), by others among the *Meliphagidæ* (*cf.* HONEY-EATER), and again by others with the *Nectariniidæ* (*cf.* SUNBIRD), the structure of the tongue, as shown by Dr. Gadow (*Proc. Zool. Society*, 1883, pp. 63, 68, pl. xvi. Fig. 2), entirely removes it from the first and third, and from most of the forms generally included among the second. On the whole it seems safest to regard the genus, at least provisionally, as the type of a distinct Family—*Zosteropidæ*—as Families go among Passerine birds; but, whether the Australian genera *Melithreptus* and *Plectorhamphus* (otherwise *Plectrorhyncha*) should be included under that heading, as has been done, remains to be proved, and in the meanwhile may be reasonably doubted. (A. N.)

ZOUCH, RICHARD (*c.* 1590–1660), a distinguished writer on civil and international law was born at

[1] The derivation is *ζωστήρ-ηρος* and *ὤψ*, whence the word should be pronounced with all the vowels long. The allusion is to the ring of white feathers round the eyes, which is very conspicuous in many species.

[2] In 1883 Mr. Sharpe (*Cat. B. Brit. Museum*, ix. pp. 146–203) admitted 85 species, besides 3 more which he had not been able to examine.

[3] By most English-speaking people in various parts of the world the prevalent species of *Zosterops* is commonly called "White-eye" or "Silver-eye" from the feature before mentioned.

[4] Sir W. Buller says that he and Mr. Gould were able to pick out New-Zealand examples from a series otherwise made up of Australian specimens. Hence it would seem as if a slight amount of differentiation had been set up; but the variation would doubtless have been greater had the species been an ancient colonist.

Anstey, Wiltshire, about the year 1590. He was educated at Winchester and afterwards at Oxford, where he became a fellow of New College in 1609. In 1613 he published a poem entitled *The Dove, or Passages of Cosmography*, which he dedicated to his relative Edward, Lord Zouch, warden of the Cinque Ports. He was admitted at Doctor's Commons in January, 1618, commenced LL.D. in April, 1619, and was appointed regius professor of law at Oxford in 1620. In 1625 he became principal of St. Alban Hall and chancellor of the diocese of Oxford; in 1641 he was made judge of the High Court of Admiralty. Under the Commonwealth, having submitted to the Parliamentary visitors, he retained his university appointments, though not his judgeship; this last he resumed at the Restoration, dying soon afterwards at his apartments in Doctor's Commons, London, on 1st March, 1660.

He published *Elementa jurisprudentiæ* (1629), *Descriptio juris et judicii feudalis, secundum consuetudines Mediolani et Normanniæ pro introductione ad jurisprudentiam Anglicanam* (1634), *Descriptio juris et judicii temporalis, secundum consuetudines feudales et Normannicas* (1636), *Descriptio juris et judicii ecclesiastici, secundum canones et consuetudines Anglicanas* (1636), *Descriptiones juris et judicii sacri, . . . militaris, . . . maritimi* (1640), *Juris et judicii fœcialis sive juris inter gentes . . . explicatio* (1650), and *Solutio quæstionis de legati delinquentis judice competente* (1657). In virtue of the last two he has the distinction of being one of the earliest systematic writers on international law.

ZSCHOKKE, Johann Heinrich Daniel (1771–1848), German author, was born at Magdeburg on 22d March, 1771. He was educated at the cloister school of his native place and at the gymnasium of Altstädt. As a youth he spent some time with a company of strolling players, but afterwards he attended the university of Frankfort-on-the-Oder, where, in 1792, he became a privat-docent. He created much sensation by two extravagant plays, *Abällino der grosse Bandit* (1794) and *Julius von Sassen* (1796), the success of which shows how urgent was the need for the elevating influence of the dramatic writings of Goethe and Schiller. The Prussian Government having declined to make him a full professor, Zschokke in 1795, after some time spent in travel, settled in the Grisons, where, in association with the burgomaster Tscharner, he conducted an educational institution in the castle of Reichenau. In recognition of his services the authorities of the Grisons gave him the rights of a citizen, and in 1798 he associated his name permanently with the country by the publication of his *Geschichte des Freistaats der drei Bünde in Rhätien*. The political disturbances of this year compelled him to close his institution; but, being a man of great resource and energy, he was able, during the revolutionary period which now began in Switzerland, to enter upon a new and more important career. He was sent as a deputy to Aarau, where he was made head of the educational department. Afterwards he was sent as Government commissioner to Unterwalden, and his authority was ultimately extended over the cantons of Uri, Schwyz, and Zug. In this high office Zschokke distinguished himself by the vigor of his administration and by the enthusiasm with which he devoted himself to the promotion of the interests of the poorer classes of the community. In 1800 he reorganized the institutions of the Italian cantons, and then he became lieutenant-governor of the canton of Basel. Zschokke retired for a while from public life when the central Government at Bern proposed to re-establish the federal system, but after the changes effected by Bonaparte he entered the service of the canton of Aargau, with which he remained connected. In 1801 he attracted attention by his *Geschichte vom Kampfe und Untergange der Schweizerischen Berg- und Wald-Cantone*. Through his *Schweizerbote*, the publication of which began in 1804, he exercised a wholesome influence on public affairs; and the like may be said of his *Miscellen der neuesten Weltkunde*, issued from 1807 to 1813. In 1811 he also started a monthly periodical, the *Erheiterungen*. He wrote various historical works, the most important of which is *Des Schweizerlandes Geschichte für das Schweizervolk*, published in 1822. He was also the author of *Bilder aus der Schweiz*, and of a series of popular tales which greatly extended his reputation,—*Der Creole*, *Alamontade*, *Jonathan Frock*, *Das Goldmacherdorf*, and *Meister Jordan*. In *Stunden der Andacht*, which was widely read, he expounded in a rationalistic spirit what seemed to him the fundamental principles of religion and morality. *Selbstschau* is a kind of autobiography. Zschokke was not a great original writer, but he secured for himself an eminent place in the literature of his time by his enthusiasm for modern ideas in politics and religion, by the sound, practical judgment displayed in his works, and by the energy and lucidity of his style. He died on 27th June, 1848.

An edition of his selected works, in forty volumes, was issued in 1824–28. In 1851–54 an edition in thirty-five volumes was published. There are biographies of Zschokke by Münch and by Emil Zschokke.

ZUCCARO, or Zucchero,[1] the name of two Italian painters.

I. Taddeo Zuccaro (1529–1566), one of the most popular painters of the so-called Roman mannerist school, was the son of an almost unknown painter at St. Angelo in Vado, called Ottaviano Zuccaro, where he was born in 1529. While yet a boy Taddeo found his way to Rome; and, though suffering great hardships from poverty and want of friends, he succeeded at an early age in gaining a knowledge of painting and in finding patrons to employ him. His first start in life, while only seventeen years old, was due to a pupil of Correggio, named Daniele da Parma, who engaged him to assist in painting a series of frescos in a chapel at Vitto near Sora, on the borders of the Abruzzi. After that Taddeo returned to Rome in 1548, and began his career as a fresco painter, by executing a series of scenes in monochrome from the life of Furius Camillus on the front of the palace of a wealthy Roman named Jacopo Mattei. From that time his success was assured, and for the rest of his short life he was largely employed by the popes Julius III. and Paul IV., by Della Rovere, duke of Urbino, and by other rich patrons of art in Rome and elsewhere. His best frescos were an historical series painted on the walls of a new palace at Caprarola, built for Cardinal Alessandro Farnese, for which Taddeo also designed a great quantity of rich decorations in stucco relief after the style of Giulio Romano and other pupils of Raphael. Nearly all his paintings were in fresco, very large in scale, and often in *chiaroscuro* or monochrome; they were more remarkable for rapidity of execution and a certain boldness of style than for any higher qualities. The very great estimation in which Taddeo's frescos were held is a striking proof of the very rapid degradation of taste which took place during the second half of the 16th century. His work is mannered in style, artificial and pompous in conception, and lacks any close or accurate knowledge of the human form and its movements. The long chapter which Vasari devotes to this painter and his brother Federigo is only one of many examples of the writer's habit of giving undue prominence to the artists of his own time and school. Taddeo Zuccaro died in Rome in 1566; he is buried in the Pantheon, not far from Raphael.

Taddeo's easel pictures are less common than his decorative frescos. A small painting on copper of the Adoration of the Shepherds, formerly in the collection of James II., is now at Hampton Court; it is a work of very small merit. The Caprarola frescos were engraved and published by Prenner. *Illustri Fatti Farnesiani Coloriti nel Real Palazzo di Caprarola*, Rome, 1748–50.

[1] So spelt by Vasari.

II. Federigo Zuccaro (1543–1609), the younger brother and pupil of Taddeo, was born in 1543. In 1550 he was placed under his brother's charge in Rome, and during his lifetime worked as his assistant; he completed the Caprarola frescos, which were unfinished when Taddeo died in 1566. In a short time Federigo attained to an eminence far beyond his very limited merits as a painter, and was perhaps the most popular artist of his generation. Probably no other painter has ever produced so many enormous frescos crowded with figures on the most colossal scale, all executed under the unfortunate delusion, common in his time, that grandeur of effect could be attained merely by great size combined with extravagance of attitude and exaggeration of every kind. Federigo's first work of this sort was the completion of the painting of the dome of the cathedral at Florence, under the patronage of the grand-duke Francesco I.; the work had been begun by the art-historian Vasari, who wrote in the most generous language about his more successful rival. The inner surface of this beautiful cupola was disfigured by Federigo in the most tasteless way. Regardless of the injury to the apparent scale of the interior of the church, he painted about 300 figures, each nearly fifty feet high, sprawling with violent contortions all over the surface. Happily age has so dimmed these pictures that their presence is now almost harmless.

After this achievement Federigo was recalled to Rome by Gregory XIII. to continue in the Pauline chapel of the Vatican the scheme of decoration which had been begun by Michelangelo during his failing years. A quarrel which arose between the painter and some members of the papal court led to his departure from Italy. He first visited Brussels, and there made a series of cartoons for the tapestry-weavers. Thence, in 1574, Federigo passed over to England, where his fame was already known, so that he at once received a large number of commissions to paint the portraits of various distinguished persons, among them Queen Elizabeth, Mary Queen of Scots,[1] Sir Nicholas Bacon, Sir Francis Walsingham, Lord High Admiral Howard, and others. A curious full-length portrait of Elizabeth in fancy dress, now at Hampton Court, is attributed to this painter, though very doubtfully. Another picture in the same collection appears to be a *replica* of his painting of the Allegory of Calumny, as suggested by Lucian's description of a celebrated work by Apelles; it was the satire in this directed against some of his courtier enemies which was the immediate cause of the pope's displeasure and Federigo's temporary exile from Rome. His success as a painter of portraits and other works in oil was more reasonable than the admiration expressed for his colossal frescos. A portrait of a Man with Two Dogs in the Pitti Palace at Florence is a work of some real merit, as is also the Dead Christ and Angels in the Borghese Gallery in Rome. After a short exile Federigo was pardoned by the pope and recalled to Rome to finish his work on the vault of the Pauline chapel. In 1585 he was invited by Philip II. of Spain to decorate the new Escorial at a yearly salary of 2000 crowns [$4228]. He accepted this offer, and worked at the Escorial from January, 1586, to the end of 1588, when he returned to Rome. He there founded in 1595, under a charter confirmed by Sixtus V., the Academy of St. Luke, of which he was the first president. This is still the chief academy of painters in Italy, and its organization suggested to Sir Joshua Reynolds his scheme for founding the English Royal Academy.

Federigo, like his contemporary Giorgio Vasari, aimed at being an art critic and historian as well as a practical artist, but with very different success. His chief book, *L'Idea de' Pittori, Scultori, ed Architetti* (Turin, 1607), is a senseless mass of the most turgid bombast. Little can be said in praise of his smaller works, consisting of two volumes printed at Bologna in 1608, describing his visit to Parma and a journey through central Italy.

Federigo was raised to the rank of a *cavaliere* not long before his death, which took place at Ancona in 1609.

For both Taddeo and Federigo Zuccaro, see Vasari, pt. iii., and Lanzi, *Storia Pittorica*, Roman school, epoch iii.

(J. H. M.)

ZUG,[1] a canton of Switzerland, ranking as eighth in the Confederation. It includes the districts round the Lake of Egeri and on both shores of the northern half of the Lake of Zug, and is the smallest undivided canton both in area and in population. Its total area is 92.3 square miles, 75 of which are classed as productive (forests 12.5), while of the rest 13 are covered with lakes. The highest point in the canton is the Wildspitz (5191 feet), the culminating peak of the Rossberg ridge. The population was 22,994 in 1880, an increase of 2001 on that of 1870, the numbers of men and women being nearly equal. German is the native tongue of 22,592, and 21,734 are Roman Catholics. Till 1814 Zug was in the diocese of Constance, but on the reconstruction of the diocese of Basel in 1828 it was assigned to it. The capital is Zug (4924 inhabitants in 1880); Baar has a population of 3896. The territory of Zug is very fertile and the population mainly agricultural. Cattle and fruit are among the chief articles of export, much cider and "kirschwasser" being manufactured. The town of Zug is connected by railway with Lucerne and Zurich, and a railway is planned to Arth, which will connect Zug directly with the St. Gotthard line. On 5th July, 1887, a landslip carried the houses of a small portion of the capital, as in 1435, into the lake.

The town of Zug is first mentioned in 1255. In 1273 it was bought by Rudolph of Hapsburg from Anna, the heiress of Kyburg and wife of Eberhard, head of the cadet line of Hapsburg; and in 1278 part of its territory (the valley of Egeri) was pledged by Rudolph as security for a portion of the marriage gift he promised to Joanna, daughter of Edward I. of England, betrothed to Hartmann (Rudolph's son), whose death in 1281 prevented the marriage taking place. The town of Zug was governed by a mayor, appointed by the Hapsburgs, and a council, and was much favored by that family. Several country districts (Baar, Menzingen, and Egeri) had each its own "landsgemeinde," but were governed by one bailiff, also appointed by the Hapsburgs; these were known as the "Ausser Amt," and were always favorably disposed to the Confederates. Duke Leopold of Austria was defeated on 15th November, 1315, by the Confederates at Morgarten Pass, in the Territory of Zug (see Switzerland, vol. xxii. p. 822 *sq.*). On 27th January, 1352, both the town of Zug and the Ausser Amt entered the Confederation, the latter being received on exactly the same terms as the town (and not, as was usual in the case of country districts, as a subject land); but in September, 1352, Zug had to acknowledge its own lords again, and in 1355 to break off its connection with the League. But about 1364 the town and the Ausser Amt were recovered for the League by the men of Schwyz, and from this time Zug took part as a full member in all the acts of the League. In 1379 the emperor Wenceslaus exempted Zug from all external jurisdictions; in 1389 the Hapsburgs renounced their claims, reserving only (in the treaty of 1394) an annual payment of twenty silver marks [$10.20], which came to an end in 1415. In 1400 Wenceslaus gave all criminal jurisdiction to the town only. The Ausser Amt then, in 1404, claimed that the banner and seal of Zug should be kept in one of the country districts, and were supported in this claim by Schwyz. The matter was finally settled by arbitration: the banner, etc., was to be kept in the town (access being allowed to the others), whilst the Ausser Amt was fined and Schwyz also. Finally in 1415 the right of electing their landammann was given to Zug by the Confederates, and a share in the criminal jurisdiction was granted to the Ausser Amt by Sigismund. In 1385 Zug joined the league of the Swabian cities against Leopold and shared in the victory of Sempach (9th July, 1386), as well as in the various Argovian (1415) and Thurgovian (1460) conquests of the Confederates, and later in those in Italy (1512), having

[1] Engraved by Vertue.

[2] Its name has been rather fancifully derived from "fischzug," meaning a "haul of fish."

already taken part in the occupation of the Val d'Ossola (1410–14, 1417–22). Between 1379 and 1470 Zug had acquired various districts in her own neighborhood, which were ruled till 1778 by the town and the Ansser Amt as subject lands.

At the time of the Reformation Zug clung to the old faith and was a member of the "Christliche Vereinigung" of 1529. In 1586 Zug became a member of the Golden League. From 1729 to 1736 the canton was distracted by violent disputes as to the distribution of the French pensions. In 1798 it opposed the French, formed part of the Tellgau, and later one of the districts of the canton of the Waldstätten (of which in 1799 it became the capital) in the Helvetic republic. In 1803 it regained its independence as a separate canton, and by the constitution of 1815 the "landsgemeinde" or assembly of all the citizens (existing for both districts since 1352) became a body of electors to choose a cantonal council. The reform movement of 1830 did not affect the canton, which in 1843 was a member of the Sonderbund and shared in the war of 1847. Both in 1848 and in 1874 it voted against the acceptance of the Federal constitutions. In 1848 the remaining functions of the "landsgemeinde" were abolished by the Liberals. Its present constitution dates from 1873–76, and was amended in 1881. There is a legislature of seventy-three members, fifty-eight (one to every 400 inhabitants) elected in the communes and fifteen by the whole population, both classes holding office for three years; the executive, of seven members, is elected by the communes for three years. By the "facultative or optional referendum," in case of a demand by one-third of the members of the legislative assembly or by 500 citizens any law, and any resolution involving a capital expenditure of 40,000 [$7720] or an annual one of 10,000 [$1930] francs, must be submitted to a direct popular vote.

ZULLA, as Salt writes the name, or ZÛLA (Thulla, Dôla), as it is also written, is a village near the head of Annesley Bay on the African coast of the Red Sea. It derives its only interest from ruins in its vicinity which are generally supposed to mark the site of the ancient emporium of Adulis (Ἀδουλις Ἀδουλεί), the port of Axum and chief outlet in the early centuries of our era for the ivory, hides, slaves, and other exports of the interior. Cosmas Indicopleustes saw here an inscription of Ptolemy Euergetes (247–222 B.C.); and hence, as the earliest mention of Adulis is found in the geographers of the first century after Christ, it is conjectured that the town must have previously existed under another name and may have been the Berenice Panchrysus of the Ptolemies. The ruins in question, which are not very extensive or remarkable, are described by Rüppel, *Reise in Abyssinien*, i. 266 (1838); see also Rohlfs in *Zeitschr. d. Gesell. f. Erdkunde in Berlin*, iii. . . . (1868), and, for further references to ancient and modern sources, the editions of the *Periplus* by C. Müller (*Geog. Gr. Min.*, i. 259) and Fabricius (1883). An Italian protectorate over the district of Zulla was proclaimed in 1888.

ZULULAND, a territory of South Africa, lying to the north of the colony of Natal, with a coast-line of about 130 miles (see vol. i. pl. II.). It is occupied chiefly by Zulu tribes; but since its conquest by England in 1879 a Boer republic, known as the New Republic, has been carved out of it, which extends into the centre of the country from the Transvaal on its northwest, and comprises an area equal to nearly one-half of the remaining portion of Zululand. This portion is composed of a strip of country adjacent to Natal, lying to the south of the Umhlatuzi river, and the district extending along the coast to the north of that river for a distance inland varying from 50 to 70 miles. The former piece of country has been known since 1882 as the Zulu Reserve. It is bounded on the southwest by the Tugela, Buffalo, and Blood rivers, the last-named being one of the borders of the Transvaal Republic.

Zululand presents very varied physical features: undulating country covered with mimosa "bush," in some parts very densely, alternates with wild and fantastically broken scenery, and thickly-wooded precipices and ravines, and these again with grass-clad hills. Two considerable forests exist in the country,—one, the Ingome Forest, lying in northern Zululand, just within the territory recently ceded to the Boers, the other upon the Natal border. These produce the varieties of timber mentioned under NATAL. The wholesale destruction of woods for domestic purposes, which has robbed that colony of much of its beauty, and is believed to have seriously affected its rainfall, has not proceeded very far at present in Zululand. The mineral resources of the country have yet to be investigated, but gold has been recently found in the Reserve. The rivers, like those in Natal, are rapid streams of small volume, running over rocky beds; the Tugela river is the most considerable. The climate differs but little from that of Natal. The country is very healthy for the most part; but horse sickness prevails in the valleys in the hot season, and the swampy neighborhood of St. Lucia Bay, a lagoon lying at the mouth of the Umfolosi river, is uninhabitable. Like the Natal natives, the Zulus cultivate the ground very superficially, planting maize, gourds of several kinds, and a grain from which a light beer is prepared. Cattle, the sole wealth of the people, were at one time very numerous in the country, and also goats. A few of the chiefs use horses.

Long after big game had become scarce in Natal, Zululand offered excellent opportunities to the sportsman. It still has antelopes of various kinds, including a few koodoo, and, at the mouths of the more northern rivers, hippopotamuses; but the buffalo and rhinoceros are not met with farther south than the densely-wooded hills near the Umfolosi river. The lion is not seen south of the Lebombo Mountains in the north of Zululand, but the leopard and smaller carnivores are plentiful enough in the country. Its natural history is similar to that of Natal; but indications are not wanting in its fauna and flora of its closer proximity to the tropics.

Language.—With the exception of the tongue spoken by the Hottentot-Bushman tribes of the southwest, the languages of Africa from about 5° north of the equator southwards are now recognized as forming one great family, for which the designation Bantu has been adopted, the word *abantu* in Zulu and other members of the group denoting "people" (plural inflex *aba*, root *ntu*). The Zulu tongue, as that of a conquering and superior race, extends beyond the river Zambesi, and is often understood even where another language is the vernacular. In the kingdoms of Lobengula and Umzila it is the language of the ruling classes. Philologists speak highly of the beauty and flexibility of the Bantu languages, and of their grammatical structure. To the student of comparative philology they offer a field of inquiry of the highest importance, both on account of the vast domain occupied by them and of the deep insight they afford into the structure and growth of human speech in general. This great linguistic family occupies about one-half of Africa, extending from near the Niger delta in the northwest, and from Lake Albert Nyanza farther east, to the southeastern extremity of the continent. It thus comprises such widely separated peoples as the Ba-Farami and Ba-Kwiri of the Cameroons region and the Zulu-Kaffres of the southeast coast on the one hand, and on the other the Wa-Ganda of the Somerset Nile and the Ova-Herero of Damaraland on the southwest coast. But, notwithstanding this widespread range, and although none of the dialects have possessed any written standard till quite recent times, being in fact everywhere spoken by peoples of low culture, the Bantu is distinguished above all other great linguistic families, except perhaps the Semitic, for its astonishing homogeneous character. So close is the resemblance the different branches bear to each other that philologists have been able to describe in broad traits the more salient features of the phonetic system, structure, and syntax common alike to all. They speak unconsciously of the Bantu language, as if it were everywhere essentially one, and this surprising uniformity is reflected in the geographical, and especially the ethnological, terminology of the southern half of the continent. Thus the natural or tribal place prefix in its various dialectic forms—*aba*, *ba*, *ama*, *bua*, *vua*, *ova*, *wa*, *mu*, *ap*, etc.,—is of constant occurrence throughout the whole of this region.

Their close uniformity is further shown in their common phonetic system, which is at once simple and harmonious, requiring all words to end in a vowel, rejecting all consonantal juxtapositions, except a few characteristic nasal combinations, such as *ng*, *mb*, *nd*, *nt*, *nw*, *mf*, *nk*, *ns*, throwing

the accent as a rule on the first vowel of the stem (*méso*), and lastly repelling all harsh sounds, except the three intruding Hottentot clicks in the Zulu-Kaffre group. Nearly all the consonantal sounds, ranging from about eighteen to twenty, occur in English, while the vowel system everywhere corresponds to that of Italian. But the most marked feature of the Bantu tongues is their so-called *alliterative concord*, which has been compared both to the gender concordance of Aryan and the progressive vowel harmony of Ural-Altaic. But it differs from the former inasmuch as it is initial and not final, and extends to the verb as well as to noun, adjective, participle, and pronoun, as if we should say in Latin, Domina mea pulchra, ama eum. Thus, in the Kongo dialect, *e kintuku kiaku kiavididi ezono kisolokele* = "the coat you lost yesterday it turned up." It differs from the Ural-Altaic system inasmuch as the concordance is regulated, not by the root vowel influencing those of the agglutinated postfixes (see URAL-ALTAIC), but by the prefixed particle, the true nature of which has not yet been determined. But a comparative study of the Bantu tongues shows that in the archaic language whence all descend each noun had a proper prefix of its own, which prefix determined both the class to which the noun belonged and the concordance of all words in the sentence dependent on that noun. That such is the correct view is evident from the fact that, even where the noun has lost its prefix, as sometimes happens, this prefix nevertheless reappears in the dependent adjective, thus revealing its original form. We see, for instance, that *nti* = "tree" was originally in the plural *minti*, because the following adjective still takes *mi*, as in *nti miandwelo* = "small trees." Bleek, the true founder of Bantu philology, has determined in the organic language eighteen such prefixes which still persist to a greater or less extent in the different branches, and have in some even been added to, as *fi*, for instance, in Kongo (W. H. Bentley). The analogy of this alliterative concord with the so-called Aryan grammatical gender is obvious, showing that the Aryan languages themselves were originally non-gender languages and that their present gender agreement is essentially a question of phonetic harmony and not of sex in any intelligible sense of the term. Hence also the extraordinary phenomenon of sex in this system apparently applied to inanimate objects.

Another remarkable feature of Bantu grammar is the wonderful development of verbal inflection, which is both final and initial. The final, which in some groups yields as many as 300 distinct forms, each conjugated throughout, belongs to the verb itself in its various active, passive, middle, negative, repetitive, reciprocal, causative, and other meanings. The initial expresses mood, tense, person, number, and alliterative concord, and the whole system is immensely complicated by the fact that, as in Basque, the Caucasian, American, and some Ural-Altaic languages, the verb incorporates the direct pronominal object. Thus: *ikuntala* = "I-see-him"; *tukutala* = "we-see-you"; *bekwatala* = "they-see-them"; and so on. Hence the form *kuntonda* = "to-see-her," for instance, will be conjugated throughout, the result being a luxuriant growth of verbal forms fully comparable to that of the richest Ural-Altaic languages.

Bleek has subjected to a comparative study twenty-five members of the family, selected from almost every region that had been explored up to his time (1862). Since then further geographical discovery, especially in the Congo and Ogoway basins, has revealed many more Bantu tongues, of which, however, too little is known to determine their mutual relations with any pretence to accuracy. But, although any attempt at a strictly scientific classification would, consequently, be premature, the subjoined table, based on geographical distribution, will be found convenient for the purpose of reference.[1]

NORTHWEST GROUP (CAMEROONS AND OGOWAY-GABOON BASINS).—Ba-Kisk, Ba-Farami, Ba-Mbuku, Mu-Fundu, Dwalla, Wuri, Ba-Koko, Ba-Kwiri, Ba-Kundu, Mpongwe, Benga, Fernandian, Ba-Kale, Ba-Ngwe, Ivili, Ajuma, Fan (?), A-Shango, Okando, Cabinda (Ba-Fyot).

CONGO GROUP.—Vua-Nyamezi, Vua-Tuzi, Vua-Hha, Vua-Fipa, Vua-Vinza, Ba-Regga, Ba-Ngala, Wa-Buma, Ba-Bemba, Wa-Biza, Vua-Rua, Ma-Rungu, Ba-Songo, Ka-Lunda, Mboshi, Ba-Mbu, Kioko.

SOUTHWEST GROUP (ANGOLA, DAMARALAND).—Mu-Sorongo, Mu-Shiconga, Kongo proper (S. Salvador), Bunda, Ba-Nano, Ba-Bwero, Ganguella, Libollo, Mu-Ndombe, Ba-Kwando, Ba-Simha, Ova-Mbo (Ovampo), Ova-Herero.

ZAMBESI GROUP.—Amboella, Ba-Lunda, Ba-Viko, Ba-Najoa, Ba-Toana, Ba-Kuba, Ba-Rotse, Ba-Toka, Ba-Shukulompo, Ma-Kalaka, Ma-Shona, Ba-Nyai, Ma-Nyanja.

SOUTH CENTRAL GROUP (BECHUANA AND BASUTO LANDS).—Ba-Rolong, Ba-Tlapi, Ba-Katla, Ba-Mapela, Ba-Hlokoa, Ba-Soetla, Ba-Suto, Ma-Kololo.

SOUTHEASTERN GROUP (ZULULAND, NATAL, KAFFRARIA).—See under article KAFFRARIA.

EASTERN GROUP (GASALAND, MOZAMBIQUE, ZANZIBAR COAST, EQUATORIAL LAKES).—Chohi, Ma-Kwakwa, Ma-Gwanza, Ma-Longwa, Ba-Hlengwe, Bila-Kulu, Ma-Ndonda, Gwa-Tevi, Ma-Kua, Ma-Ngwangwara, Ma-Tamhwe, Wa-Nindi, Ma-Wa, Wa-Hiyao (Yao or Ajawa), Ma-Ganya, Wa-Swaheli, Wa-Segua, Wa-Sambara, Wa-Zaramo, Wa-Kamba, Wa-Nika, Wa-Pokomo.

The pedigree and affinity of the Zulus, that is, the northern branch of the Zulu-Kaffre group, are given under KAFFRARIA. Here it will suffice to add that since the establishment of the Zulu military ascendency early in the 19th century various Zulu hordes have successively invaded and overrun a great part of southeast Africa, as far as and even beyond the Lake Nyassa district. Throughout these regions they are variously known as Ma-Zitu, Ma-Ravi, Ma-Ngone (Umgone), Matebele (Ama-Ndebeli), Ma-Viti, and Aba-Zanzi. Such is the terror inspired by these fierce warriors that many of the conquered tribes, such as the Wa-Nindi of Mozambique, have adopted the very name of their conquerors or oppressors. Hence the impression that the true Zulus are far more numerous north of the Limpopo than has ever been the case. In most places they have already become extinct or absorbed in the surrounding populations. But they still hold their ground as the ruling element in the region between the Limpopo and the lower Zambesi, which from them takes the name of Matebeleland, and which, like Zululand itself, has recently (1888) become a British protectorate.

Laws and Customs.—The Zulus possess an elaborate system of laws regulating the inheritance of personal property (which consists chiefly of cattle), the complexity arising from the practice of polygamy and the exchange of cattle made upon marriage. The giving of cattle in the latter case is generally referred to as a barter and sale of the bride, from which indeed it is not easily distinguishable. But it is regarded in a different light by the natives themselves. The kraal is under the immediate rule of its headman, who is a patriarch responsible for the good behavior of all its members. Over the headman, whose authority may extend to more than one kraal, is the tribal chief. The exercise by some of the principal chiefs, during the reigns of mPande and his son, of the power of life and death could not always be controlled by the central authority. Several of the Zulu customs resemble those of the Jews, such as the Feast of First Fruits, held upon the ripening of the maize, when the whole nation gathers at the king's kraal, and the custom of raising up seed to a deceased brother. By the custom of *ukuhlonipa* a woman carefully avoids the utterance of any word which occurs in the names of the principal members of her husband's family: *e.g.*, if she have a brother-in-law named uNkomo, she would not use the Zulu for "cow," *inkomo*, but would invent some other word for it. The employment of "witch doctors" for "smelling out" criminals or *abatagati* (usually translated "wizards," but meaning evildoers of any kind, such as poisoners) is still common in Zululand, as in neighboring countries, although it was discouraged by Cetshwayo, who established "kraals of refuge" for the reception of persons rescued by him from condemnation as *abatagati*.

Population.—No means exist for estimating the present population of Zululand. The country was at the time of the late war regarded as less densely inhabited than the colony of Natal. The Zulu army was estimated to contain twenty-three regiments, of 40,400 men in all, and, although the enrolment was voluntary, it may be assumed that it comprised nearly all the able-bodied men of the nation. In addition to the heavy mortality sustained by the Zulus in the war many lives have been lost in subsequent conflicts in which they have engaged amongst themselves.

History.—The earliest record of contact between Europeans and the Zulu race is probably the account of the wreck of the "Doddington" in 1756. The survivors met with hospitable treatment at the hands of the natives of Natal, and afterwards proceeded up the coast to St. Lucia Bay, where they landed. They describe the natives as "very proud and haughty, and not so accommodating as those lately left." They differed from the other natives in the superior neatness of their method of preparing their food, and were more cleanly in their persons, bathing every morning, apparently as an act of devotion. Their chief pride seemed to be to keep their hair in order. It is added that they watched strictly over their women.

In 1780 the Zulu tribe inhabited the valley of the White Umfolosi river under the chieftainship of Senzangakona. At that time the Zulus numbered some few thousands only, being subject to the paramount chief Dingiswayo, who ruled

[1] To avoid confusion the names are given with their ethnical instead of their linguistic prefixes. Thus, Ba-Suto, not Se-Suto.

over the mTetwa tribe, which inhabited the country to the northeast of the Tugela. Dingiswayo is represented as having been very much in advance of other chiefs in those parts in enlightenment and intelligence. He opened up a trade with the Portuguese, bartering ivory and oxen for beads and brass. He was also very warlike, and introduced a strict military organization among his people, by means of which he obtained the ascendency over neighboring tribes, including that of the Zulus. Upon the death of Senzangakona at the beginning of the 19th century he was succeeded by a son named Tshaka, who had served as an officer in the army of Dingiswayo, whose favor he won through his force of character and talents. Dingiswayo having been killed in battle, the mTetwa tribe sought the protection of Tshaka, who lost no time in further developing the new military organization, and very soon became master of nearly the whole of southeastern Africa from the Limpopo to Cape Colony, including the settlement of Natal, Basutoland, a large part of the Orange Free State, and the Transvaal Republic. The terror of the Zulu arms was, moreover, carried far into the interior through the revolt of a Zulu chief, Mzilikazi (Moselekatse), who conquered a vast territory towards the northwest.

Tshaka's strict discipline and mode of attack, in which the long missile weapon of the other tribes was replaced by a short stabbing assegai, was such that nothing in the mode of warfare of those opposed to him could withstand him. He overran the district of Natal with his armies in 1820; but crowds of the northern tribes driven before his onslaught passed through the country about 1812.

In 1825 an English naval officer, Lieutenant Farewell, visited Tshaka with the object of obtaining leave to establish a settlement in what is now the district of Natal. He found the king at Umgungindhlovu, "surrounded by a large number of chiefs, and about 8000 or 9000 armed men, observing a state and ceremony in our introduction that we little expected." The king showed his visitor much friendliness, making him a grant of land in that neighborhood. Lieutenant Farewell took formal possession of the territory he had received, which he described as nearly depopulated and not containing more than 300 or 400 inhabitants, on 27th August, 1825. The Zulu monarch, being anxious to open a political connection with the Cape and English Governments, entrusted in 1828 one of his principal chiefs, Sotobi, and a companion to the care of Lieutenant King, to be conducted on an embassage to Cape Town, Sotobi being commissioned to proceed to the king of England. From causes which are not now certainly known these people were not allowed to proceed beyond Port Elizabeth, and were soon sent back to Zululand. On 23d September, 1828, Tshaka was murdered by his brother, Mhlangana, and a few days afterwards Mhlangana was killed by another brother, Dingane. Tshaka's reign had involved an immense sacrifice of human life, but he had set before himself the aim of establishing a great kingdom, and, having succeeded in that, his home rule had been relieved by acts of generosity and statesmanship.

What is recorded of Dingane's reign shows him in the light of a bloodthirsty and cruel monster without a redeeming feature. The attempts made by the emigrant Dutch Boers under Piet Retief to establish friendly relations with him, and obtain a cession of the district of Natal, ended in the massacre of the whole party of seventy of their leading men at the king's kraal (February, 1838), and of all members of their families left behind in Natal who could not be collected into fortified camps. Two unsuccessful attempts were made to avenge the deaths of the emigrant Boers. A Dutch command under Pieter Uys invaded the Zulu country, but was compelled to retreat, leaving their leader behind them, while a considerable force, composed of English settlers, Boers, and natives, entered Zululand at the mouth of the Tugela, and was completely annihilated, after inflicting very great loss on the Zulus. A detachment of the Zulu army on this occasion entered Natal and compelled the settlers at the port to take refuge on board a ship. After a further attack by Dingane the emigrant Boers and settlers again invaded Zululand in December, 1838, and after a severe engagement defeated the Zulu army with great slaughter on the banks of the Blood river, which owes its name to the results of the victory. In 1840 the Boers agreed to support Dingane's brother mPande in rebellion against him. The movement was completely successful, several of Dingane's regiments going over to mPande. Dingane passed into Swaziland in advance of his retreating forces and was there murdered, while mPande was crowned king of Zululand by the Boers, who received in exchange for their services the much-coveted district of Natal. During the next sixteen years of mPande's reign nothing occurred to disturb the peaceful relations between the Zulus and the Natal Government. In 1856 a civil war broke out between two of mPande's sons, Cetshwayo and Umbulazi, who were rival claimants for the succession. A bloody battle was fought between them on the banks of the Tugela in December, 1856, in which Umbulazi and many of his followers were slain. The Zulu country continued, however, excited and disturbed, until the Government of Natal in 1861 obtained the formal nomination of a successor to mPande; and Cetshwayo was appointed. mPande died in October, 1872, but practically the government of Zululand had been in Cetshwayo's hands since the victory of 1856, owing both to political circumstances and the failing health of his father. In 1873 the Zulu nation appealed to the Natal Government to preside over the installation of Cetshwayo as king; and this request was acceded to. The rule of mPande was in earlier years a severe one, the executions ordered by him being so numerous in 1859 as to evoke remonstrances from Cetshwayo, who warned the king that he would drive all the people over into Natal. In 1856 and for some years afterwards a considerable exodus of refugees did take place into the colony, but by 1871 the tide appeared to be turning the other way. In 1854 the native population in Natal was reckoned at from 100,000 to 120,000. By 1873, owing largely to the influx of refugees from Zululand, it had risen to 282,783; but five years later it had not increased to more than 290,035, some hundreds of heads of families having returned to Zululand.

The encroachments of the Transvaal Boers upon the borders of Zululand having for many years exposed the British Government to urgent appeals on the part of the Zulus for its intervention, a second attempt was made by the Government of Natal, and this time with success, to induce the Boers to submit the boundary disputes between them and their neighbors to arbitration. A commission was appointed, composed of three British officers, who in June, 1878, pronounced a decision substantially in favor of the Zulus. But the high commissioner, Sir Bartle Frere, had determined upon measures for remodelling the Zulu nation with a view to the confederation of the South African colonies and states. The invasion of Zululand took place in January, 1879, and the war was ended by the capture of the king at the end of August. Cetshwayo having been conveyed to Cape Town, the Zulu country was portioned out among eleven Zulu chiefs, a white adventurer, and a Basuto chief who had done good service in the war. This arrangement was productive of much bloodshed and disturbance, and in 1882 the British Government determined to restore Cetshwayo again to power. In the meantime, however, the deepest blood feuds had been engendered between the chiefs Zibebu and Hamu on the one side and the neighboring tribes who supported the ex-king and his family on the other. These people suffered severely at the hands of the two chiefs, who were assisted by a band of white freebooters. Zibebu, having created a formidable force of well-armed and trained warriors, was left in independence on the borders of Cetshwayo's territory, while the latter was restrained by the conditions of his restoration from any military enterprise or defensive measures. A collision very soon took place; but in the conflicts that followed Zibebu's forces were victorious, and on 22d July, 1883, led by a troop of mounted whites, he made a sudden descent upon Cetshwayo's kraal at Ulundi, which he destroyed, massacring such of the inmates of both sexes as could not save themselves by flight. The king escaped, though wounded, into the Reserve, which had been placed under British rule; there he died in 1884. He left a son, Dinuzulu, who sought the assistance of some of the Transvaal Boers against Zibebu, whom he defeated and drove into the Reserve. These Boers, not a large number, claimed as a stipulated reward for their services the cession of the greater part, and the more valuable part, of central Zululand. The Government of Natal has recently attempted to mediate on behalf of the Zulus and has accepted on their behalf, in spite of their protests, a line which roughly divides central Zululand into two equal portions. Of these the northwestern has been created into the independent Boer state already mentioned. The rest of central Zululand is administered, with the Reserve, as a British protectorate.

(F. E. C.–A. H. K.)

ZURBARAN, FRANCISCO (1598–1662), a distinguished Spanish painter, was born at Fuente de Cantos

in Estremadura on 7th November, 1598. His father was named Luis Zurbaran, a country laborer, his mother Isabel Marquet. The lot apparently marked out for Francisco was that of tilling the ground, like his father; but his natural faculty had decided otherwise. In mere childhood he set about imitating objects with charcoal; and his father was quick-witted and long-headed enough to take him off, still extremely young, to the school of Juan de Roélas in Seville. Francisco soon became the best pupil in the studio of Roélas, surpassing the master himself; and before leaving him he had achieved a solid reputation, full though Seville then was of able painters. He may probably have had here the opportunity of copying some of the paintings of Michelangelo da Caravaggio; at any rate he gained the name of "the Spanish Caravaggio," owing to the very forcible realistic style in which he excelled. He constantly painted direct from nature, following but occasionally improving on his model; and he made great use of the lay-figure in the study of draperies, in which he was peculiarly proficient. He had a special gift for white draperies; and, as a natural consequence, Carthusian monks are abundant in his paintings. To these rigidly faithful methods of work Zurbaran is said to have adhered throughout his career, which was always eminent and prosperous, wholly confined to his native Spain, and varied by few incidents beyond those of his daily laborious and continually productive diligence. His subjects were mostly of a severe and ascetic kind,—religious vigils, the flesh chastised into subjection to the spirit,—the compositions seldom thronged, and often reduced to a single figure. The style is more reserved and chastened than Caravaggio's, the tone of color often bluish to a morbid excess. Exceptional effects are attained by the precise finish of foregrounds, largely massed out in light and shade. Zurbaran married in Seville Leonor de Jordera, by whom he had several children. Towards 1630 he was appointed painter to Philip IV.; and there is a story that on one occasion the sovereign laid his hand on the artist's shoulder, saying, "Painter to the king, king of painters." It was only late in life that Zurbaran made a prolonged stay in Madrid, Seville being the chief scene of his operations. He died in 1662 in Madrid.

In 1627 he painted the great altarpiece of St. Thomas Aquinas, now in the Seville museum; it was executed for the church of the college of that saint in the same city. This is Zurbaran's largest composition, containing figures of Christ and the Madonna, various saints, Charles V. with knights, and archbishop Deza (founder of the college) with monks and servitors, all the principal personages being beyond the size of life; this work is full of fine portrait-like heads and it ranks, both in importance and in elevated style, as the painter's masterpiece. It had been preceded by the numerous pictures of the screen of St. Peter Nolasco in the cathedral. In the church of Guadalupe he painted various large pictures, eight of which relate to the history of St. Jerome, and in the church of St. Paul, Seville, a famous figure of the Crucified Saviour, in grisaille, presenting an illusive effect of marble. In 1633 he finished the paintings of the high altar of the Carthusians in Jerez. In the palace of Buenretiro, Madrid, are four large canvases representing the Labors of Hercules, an unusual instance of non-Christian subjects from the hand of Zurbaran. A very fine specimen is in the London National Gallery, a whole-length life-sized figure of a kneeling Franciscan holding a skull (figured in vol. xxi. p. 459, Fig. 36).

The principal scholars of this master, whose style has as much affinity to that of Ribera as to Caravaggio's, were Bernabe de Ayala and the brothers Polanco.

ZURICH (Germ. *Zürich*),[1] a canton in Switzerland, ranking as the first in dignity. It is of very irregular shape, consisting simply of the conquests made by the city. It extends from the Lake of Zurich to the Rhine, taking in the district of Eglisau on the right bank of that river. On the east it is, roughly speaking, limited by the ranges of low hills which separate it from the valley of the Thur, and on the west by those (*e.g.*, the Albis) which divide it from the valleys of the Reuss and the Aar. Its total area is 655.9 square miles, of which 610.6 are classified as fertile (woods covering 186 and vines 21.5). Of 45.2 square miles of non-fertile land 26.2 are covered by the lake. The highest point in the canton is the Schnebelhorn (4250 feet) in the southeast corner. The population in 1880 was 317,576 (an increase of 32,790 since 1870), and in 1887 was estimated to be 339,163. In 1880 there were 313,762 German-speaking and 283,134 Protestant inhabitants. The number of Roman Catholics nearly doubled from 1870 to 1880 (17,942 and 30,298). Besides ZURICH (see below), the capital, the only other town of any size in the canton is WINTERTHUR (*q.v.*). The land is very highly cultivated and is held by no less than 36,000 proprietors. The canton is well supplied with railways, the first line of any length in Switzerland being that from Zurich to Baden in Aargau (opened 1847). The line from Zurich to the summit of the Uetliberg (2861 feet) was made in 1875. For the history of the canton, see under the town, below.

ZURICH, chief city of the above canton, and until 1848 practically the capital of the Swiss Confederation, is beautifully situated, at a height of 1506 feet, on the banks of the Limmat where it issues from the Lake of Zurich, and on the river Sihl, which joins the Limmat just above the north end of the lake. That part which lies on the right bank of the Limmat is known as the Large Town, that on the left as the Little Town. The central portion—the "city"—is governed by an executive of seven members and a town council of sixty, both elected by the citizens, and in 1887 had 27,638 inhabitants. The nine outlying townships or "gemeinden" have each a separate organization, distinct from that of the city, and in 1887 had 60,836 inhabitants, of whom 18,527 were in Aussersihl and 10,883 in Riesbach. The total population of the town and its suburbs was thus 88,474 in 1887. These are nearly all Protestants and German-speaking. The number of Roman Catholics has doubled in the last ten years; they are mainly resident in Aussersihl, the workmen's quarter, where also many Italian-speaking persons dwell. There are in Zurich about 7000 Old Catholics.

Of the old buildings the finest and most important is the Gross Münster (or Propstei) on the right bank of the Limmat. This was originally the church of the king's tenants, and in one of the chapels the bodies of Felix, Regula, and Exuperantius, the patron saints of the city, were buried, the town treasury being formerly kept above this chapel. The present building was erected at two periods (1090–1150 and 1225–1300), the high altar having been dedicated in 1278. The towers were first raised above the roof at the end of the 15th century and took their present form in 1779. The chapter consisted of twenty-four secular canons; it was reorganized at the Reformation (1526), and suppressed in 1832. On the site of the canons' houses stands a girls' school (opened 1853), but the fine Romanesque cloisters (12th and 13th centuries) still remain. There is a curious figure of Charlemagne in a niche on one of the towers; to him is attributed the founding or reform of the chapter. On the left bank of the Limmat stands the other great church of Zurich, the Frau Munster (or Abtei), founded for nuns in 853 by Louis the German. The high altar was dedicated in 1170; but the greater part of the buildings are of the 13th and 14th centuries. It was in this church that the relics of the three patron saints of the town were preserved till the Reformation, and it was here that the burgomaster Waldmann was buried in 1489. There were only twelve nuns of noble family, comparatively free from the severer monastic vows; the convent was suppressed in 1524. Of the other old churches may be mentioned St. Peter's, the oldest parish church, though the present buildings date from the 13th century only, and formerly the meeting-place of the citizens; the Dominican church (13th century), in the choir of which the cantonal library of 80,000 volumes has been stored since 1873; the church of the Austin friars (14th century), now used by the Old Catholics; and the Wasserkirche. The last-named church is on the site of an old pagan holy place, where the patron

[1] The name is derived from the Celtic *dur* (water) The true and accurate Latinized form is *Turicum*, but the false form *Tigurum* was given currency to by Glareanus and held its ground from 1512 to 1748.

saints of the city were martyred; since 1631 it has housed the city library, the largest in Switzerland, which contains 120,000 printed volumes and 4000 MSS. (among these being letters of Zwingli, Bullinger, and Lady Jane Grey), as well as a splendid collection of objects from the lake dwellings of Switzerland. The building itself was erected 1479 to 1484, and near it is a statue of Zwingli, erected in 1885. The existing council house dates from 1698, and the guild houses were mostly rebuilt in the 18th century. Among the modern buildings the polytechnic school, the cantonal school, the reading rooms (museum), the hospital, and the railway station are the most conspicuous. There are some fine old fountains (the oldest dating back to 1568). The quays along the river and the lake are extensive and afford fine views; and there are several good bridges, Roman traces being still seen in the case of the Niederbrücke. The mound of the Lindenhof was formerly crowned by the king's house, which disappeared in the 13th century, and the hillock was planted with limes as early as 1422. Zurich possesses a large number of charitable institutions.

The inhabitants are very industrious and of social habits among themselves, the town being noted for its clubs and societies. It is the intellectual capital of German-speaking Switzerland, and has been called "Athens on the Limmat." Cotton-spinning and the manufacture of machinery are two of the leading industries, but by far the most important of all is the silk trade. This flourished in Zurich in the 12th and 13th centuries, but disappeared about 1420; it was revived by the Protestant exiles from Locarno (1555) and by the Huguenot refugees from France (1682 and 1685). The value of the silk annually exported (mainly to France, the United States, and England) is estimated at £2,916,000 to £3,333,000. The trade employs about 20,000 hand looms and 4500 steam-power looms; but the number of the former is diminishing, while that of the latter is increasing. Poor wine is also made. Zurich is the banking centre of Switzerland. There are a large number of educational establishments, public and private. Besides the excellent primary and secondary schools, there are the cantonal schools, including a gymnasium and a technical side (opened 1842), and a high school for girls (opened 1875). The cantonal university and the Federal polytechnic school are housed in the same building, but have no other connection. The university was founded in 1832–33 (no doubt as a successor to the ancient chapter school at the Gross Müuster, said to date back to Charlemagne's time—hence its name the Carolinum—reorganized at the Reformation, and suppressed in 1832); in 1886 it had 51 professors and 481 matriculated students, besides 65 persons attending special courses of lectures. The polytechnic school, founded in 1854, includes six main sections (industrial chemistry, mechanics, engineering, training of scientific and mathematical teachers, architecture, forestry and agriculture), and a general philosophical, mathematical, and literary department. The numbers of students in the first three sections were, in 1885, 122, 97, and 90—in all the six 412, of whom 192 were foreigners; there were about fifty-four professors. The polytechnic school has good collections of botanical specimens and of engravings. Near it is the observatory (1542 feet). There are also in Zurich many institutions for special branches of education—*e.g.*, veterinary surgery, music, industrial art, silk-weaving, etc.

History.—The earliest inhabitants of the future site of Zurich were the lake dwellers. The Celtic Helvetians had a settlement on the Lindenhof when they were succeeded by the Romans, who established a customs station here for goods going to and coming from Italy; during their rule Christianity was introduced early in the 3d century by Felix and Regula, with whom Exuperantius was afterwards associated. The district was later occupied by the Alemanni, who were conquered by the Franks. It is not till the 9th century that we find the beginnings of the Teutonic town of Zurich, which arose from the union of four elements: (1) the royal house and castle on the Lindenhof, with the king's tenants around, (2) the Gross Münster, (3) the Frau Münster, (4) the community of "free-men" (of Alemannian origin) on the Zürichberg. The Frankish kings had special rights over their tenants, were the protectors of the two churches, and had jurisdiction over the free community. In 870 the sovereign placed his powers over all four in the hands of a single official (the Reichsvogt), and the union was still further strengthened by the wall built round the four settlements in the 10th century as a safeguard against Saracen marauders and feudal barons. The Reichsvogtei passed to the counts of Lenzburg (1063–1172), and then to the dukes of Zäringen (extinct 1218). Meanwhile the abbess of the Frau Münster had been acquiring extensive rights and privileges over all the inhabitants, though she never obtained the criminal jurisdiction. The town flourished greatly in the 12th and 13th centuries, the silk trade being introduced from Italy. In 1218 the Reichsvogtei passed back into the hands of the king, who appointed one of the burghers as his deputy, the town thus becoming a free imperial city under the nominal rule of a distant sovereign. The abbess in 1234 became a princess of the empire, but power rapidly passed from her to the council, which she had originally named to look after police, etc., but which (*c.* 1240) came to be elected by the burghers, though the abbess was still "the lady of Zurich." This council was made up of the representatives of certain knightly and rich mercantile families (the "patricians"), who excluded the craftsmen from all share in the government, though it was to these last that the town was largely indebted for its rising wealth and importance.

In October, 1291, the town made an alliance with Uri and Schwyz, and in 1292 failed in a desperate attempt to seize the Hapsburg town of Winterthur. After that Zurich began to display strong Austrian leanings, which characterize much of its later history. In 1315 the men of Zurich fought against the Swiss Confederates at Morgarten. The year 1336 marks the admission of the craftsmen to a share in the town government, which was brought about by Rudolph Brun, a patrician. Under the new constitution (the main features of which lasted till 1798) the council was made up of thirteen members from the "constafel" (including the old patricians and the wealthiest burghers) and the thirteen masters of the craft guilds, each of the twenty-six holding office for six months. The office of burgomaster was created and given to Brun for life. Out of this change arose a quarrel with one of the branches of the Hapsburg family, in consequence of which Brun was induced to throw in the lot of Zurich with the Swiss Confederation (1st May, 1351). The double position of Zurich as a free imperial city and as a member of the Everlasting League was soon found to be embarrassing to both parties (see SWITZERLAND, vol. xxii. p. 822 *sq.*). Meanwhile the town had been extending its rule far beyond its walls,—a process which began in the 13th century, went on apace in the 14th, and attained its height in the 15th century (1268–1467). This thirst for territorial aggrandizement brought about the first civil war in the Confederation (the "Old Zurich War," 1436–50), in which, at the fight of St. Jacob on the Sihl (1443), under the walls of Zurich, the men of Zurich were completely beaten and their burgomaster Stüssi slain. The purchase of the town of Winterthur from the Hapsburgs (1467) marks the culmination of the territorial power of the city. It was to the men of Zurich and their leader Hans Waldmann that the victory of Morat (1476) was due in the Burgundian War; and Zurich took a leading part in the Italian campaign of 1512–15, the burgomaster Schmid naming the new duke of Milan (1512). No doubt her trade connections with Italy led her to pursue a southern policy, traces of which are seen as early as 1331 in an attack on the Val Leventia and in 1478, when Zurich men were in the van at the fight of Giornico, won by a handful of Confederates over 12,000 Milanese troops.

In 1400 the town received from the emperor the Reichsvogtei, which carried with it complete immunity from the empire and the right of criminal jurisdiction. As early as 1393 the chief power had practically fallen into the hands of the council of 200 (really 212), composed of the former council and a number of other citizens originally elected by it; and in 1498 this change was formally recognized. This transfer of all power to the guilds had been one of the aims of the burgomaster Hans Waldmann (1483–89), who wished to make Zurich a great commercial centre. He also introduced many financial and moral reforms, and subordinated the interests of the country districts to those of the town. He practically ruled the Confederation, and under him Zurich became the real capital of the League. But such great changes excited opposition, and he was overthrown and executed. His main ideas were embodied, however, in the constitution of 1498, by which the patricians became the first of the guilds, and which remained in force till 1798; some special rights were also given to the subjects in country districts. It was, however, the prominent part taken by Zurich in adopting and propagating the principles of the Reformation which finally secured for it the lead of the Confederation; for a detailed account of its policy and the events in which it shared during this period, see SWITZERLAND (vol. xxii. p. 828 *sq.*) and ZWINGLI.

In the 17th and 18th centuries a distinct tendency becomes observable in the city governments to limit power to the actual holders. Thus the country districts were consulted for the last time in 1620 and 1640; and a similar breach of the charters of 1489 and 1531 occasioned disturbances in 1777. The council of 200 came to be chosen by a small committee of the members of the guilds actually sitting in the council, and early in the 18th century a deter-

mined effort was made to crush by means of heavy duties the flourishing silk trade in Winterthur. In 1655 an attempt was made by Bern and Zurich to set up a central administration in the Confederation, which failed through the jealousy of the other cantons. The first symptoms of active discontent appeared later among the dwellers by the lake, who founded in 1794 a club at Stäfa and claimed the restoration of the liberties of 1489 and 1531, a movement which was put down by force of arms in 1795. The old system of government perished in Zurich, as elsewhere in Switzerland, in 1798, and under the Helvetic constitution the country districts obtained political liberty. But under the cantonal constitution of 1815 the town had 130 representatives in the great council, while the country districts had only 88. A great meeting at Uster on 22d November, 1830, demanded that two-thirds of the members in the great council should be chosen by the country districts; and in 1831 a new constitution was drawn up on these lines, though it was not till 1837–38 that the town finally lost the last relics of the privileges which it had so long enjoyed as compared with the country districts. In 1833 Zurich tried hard to secure a revision of the Federal constitution and a strong central Government. The town was the Federal capital for 1839–40, and consequently the victory of the Conservative party there caused a great stir thoughout Switzerland. But, when in 1845 the radicals regained power at Zurich, which was again the Federal capital for 1845–46, that city took the lead in opposing the Sonderbund cantons. In 1869 the cantonal constitution was again thoroughly revised in a very democratic sense; and with the exception of a few changes made later, it is the existing constitution. There is an executive of seven members and a legislature of 211 (one member to every 1500 inhabitants), each holding office for three years and elected at the same time directly by the vote of the people. The referendum exists in both forms, compulsory and optional: all laws and all money grants of a total sum over 250,000 francs or an annual sum of 20,000 must be submitted to a popular vote, the people meeting for that purpose at least twice in each year, while the executive may submit to a popular vote any other matter, though it fall within its powers as defined by law. One-third of the members of the legislature or 5000 legally qualified voters can force the Government to submit to the people any matter whatsoever (initiative). The constitution provides for the imposition of a graduated and progressive income tax. In 1885 the penalty of death was abolished in the canton. Zurich has sheltered many political refugees of late years, especially Poles and Russians; but its hospitality has been abused by the Socialists, who have given considerable trouble. The Swiss National Agricultural and Industrial Exhibition was held at Zurich in 1883.

For the present state of the town, see *Europäische Wanderbilder* (Nos. 126–129), Zurich, 1887. For the local and architectural history the principal work is S. Vögelin, *Das alte Zürich* (2d ed., 1878), and for general history, J. C. Bluntschli, *Staats-und Rechts-Geschichte der Stadt und Landschaft Zürich* (2d ed., 1856); G. v. Wyss, *Geschichte der Abtei Zürich*, 1851-58 (in vol. viii. of *Mittheil. d. antiquar. Gesellsch. in Z.*); Id., *Die Reichsvogtei Zürich*, 1870 (in vol. xvii. of *Zeitschr. f. Schweiz. Recht*). Many of the recent works on Swiss history, *e.g.*, those of Dändliker, Oechsli, Orelli, Strickler, are by Zurich men and pay special attention to Zurich matters.
(W. A. B. C.)

ZUTPHEN, a fortified town of Holland, in the province of Guelderland, 20 miles by rail south from Deventer, stands on the right bank of the Yssel at its junction with the Berkel. Its most important public building is the church of St. Walburga, dating from the 12th century, which contains several interesting monuments of the counts of Zutphen, and good examples of old metal-work and sculpture. The place has an active trade, especially in grain and in the timber floated down from the Black Forest by the Rhine and the Yssel; the industries include tanning, weaving, and oil and paper manufactures. The population in 1887 was 16,357. Some 2½ miles to the north of the town is the agricultural colony of Nederlandsch-Mettray, founded by a private benefactor for the education of poor and friendless boys in 1851, and since that date largely extended.

Zutphen at one time belonged to the Hanseatic League and had an extensive foreign trade. It has been more than once besieged, and it was before Zutphen that Sir Philip Sydney received his mortal wound (22d September, 1586).

ZWEIBRÜCKEN. See Deux Ponts.

ZWICKAU, one of the busiest towns in the industrial district of the kingdom of Saxony to which it gives its name, is situated in a pleasant valley on the left bank of the Zwickauer Mulde, 41 miles south of Leipsic. The river is here crossed by four bridges, two of which are of iron. The town contains six churches, including the fine Late Gothic church of St. Mary (1453–1536, restored 1884), with a tower 278 feet high, and the Gothic church of St. Catherine (14th to 15th century), of which Thomas Münzer was pastor in 1520–22. Among the secular buildings are the town-house of 1581, the Gothic "Gewandhaus" (now a theatre) of 1522–24, the Government buildings of 1838, the law-courts, the hospital, and the barracks. The railway station, which with its dependencies covers 81 acres, is said to be one of the largest in Germany. The château of Osterstein (1581–91) is now a penitentiary. The manufactures of Zwickau are both extensive and varied; they include machinery, chemicals, porcelain, paper, glass, dyestuffs, tinware, stockings, and curtains. There are also steam saw-mills, brickfields, iron-foundries, and breweries. Though no longer so important as when it lay on the chief trade route from Saxony to Bohemia and the Danube, Zwickau still carries on considerable commerce in grain, linen, and coal. The mainstay of the industrial prosperity of the town is the adjacent coalfield, which in 1885 employed 10,000 hands and yielded coal to the value of £854,900 [$4,154,814]. The mines are mentioned as early as 1348; but they have been actively worked only for the last 65 years, during which time the population of the town has increased more than sixfold. In 1885 the population was 39,245; in 1834 it was 6701.

Zwickau is of Slavonic origin, and is mentioned in 1118 as a trading place. From 1290 till 1348 it was a free imperial city, but about the latter date it was forced to accept the protection of the margrave of Meissen. The Anabaptist movement of 1525 began at Zwickau under the inspiration of the "Zwickau prophets." Robert Schumann (1810–1856), the musical composer, was born here. The name is sometimes fancifully derived from the Latin *cygnea*, from a tradition that placed a "swan lake" here which had the property of renewing the youth of those who bathed in it.

ZWINGLI, Huldreich (1484–1531), Swiss Reformer, was born on 1st January, 1484, at Wildhaus, at the head of the Toggenburg valley, in the canton of St. Gall, Switzerland. His father was a well-to-do peasant proprietor, amman of the township; his mother was Margaret Meili, whose brother was abbot of the cloister of Fischingen in Thurgau. The people of Wildhaus were in Zwingli's time a self-ruled village community. They had also bought from the abbots of St. Gall the privilege of electing their own pastor; and the first parish priest chosen by the votes of the parishioners was Bartholomew Zwingli, the uncle of the Reformer, who latterly became dean of Wesen. Zwingli thus came of a free peasant stock, and he carried the marks of his origin all his life. When eight years old he was sent to school at Wesen, where he lived with his uncle, the dean. Two years later he was sent to Basel; and after a three years' sojourn there he became a pupil in the high school of Bern, where his master was Heinrich Wölflin, an accomplished classical scholar, from whom Zwingli acquired that love of classical literature which never left him. From Bern he went to Vienna (in 1500), and after two years' study there he returned to Basel. At Basel the celebrated Thomas Wyttenbach was his master and friend, and taught him those Evangelical truths which he afterwards so signally defended.

It is impossible to avoid contrasting the joyous youth of Zwingli with the sad childhood of Luther. Zwingli was full of love of family, of township, of country, and of Christ. He had none of those dark religious experiences which drove Luther to the convent, and which made him miserable there. He had never to struggle alone in despair of soul, one step at a time, towards the gospel of God's free grace. Wyttenbach was very unlike those nominalist divines from whom Luther learnt mediæval theology. He foresaw many things which a later generation discovered,

Zwingli has assured us that Wyttenbach taught him that the death of Christ, and not priests, masses, and pilrimages, was a sufficient ransom for the sins of the world; that he pointed out the errors of the schoolmen and of Romish theology; and that he asserted that Holy Scripture, and not ecclesiastical tradition, was the sole rule of faith. It cost Zwingli nothing to break with the mediæval church. He had been taught independence from childhood, and shown how to think for himself while a student at Basel.

When twenty-two years of age Zwingli was ordained by the bishop of Constance. He preached his first sermon at Rapperswyl, and said his first mass among his own people at Wildhaus. He was appointed (1506) to the parish of Glarus, where he had leisure for study and began to read extensively and carefully in preparation for future work. At Glarus too he gathered the boys of the district about him (Ægidius Tschudi, the historian of Switzerland, among them) to teach them the classics; and he set himself by a study of the masterpieces of ancient and mediæval rhetoric to learn the art of oratory. He tells us that at this time he foresaw that a man who is called to be a preacher must know many things, two things above all others —God, and how to speak. Meanwhile he tested every doctrine in theology by the Word of God and took his stand firmly upon what it taught him.

The Swiss troops of Zwingli's day were supposed to be the best in Europe, and neighboring states were glad to have their assistance in war. The Swiss were accustomed to hire out their soldiers for large sums of money to those states who paid best. It was their custom also to send the parish priest of the district from which the troops came as chaplain to the regiment. Zwingli went twice, once in 1512 and again in 1515, with the men of Glarus. He saw the demoralizing tendency of such mercenary warfare and ever afterwards denounced the immoral traffic. In 1521 he persuaded the authorities of the canton of Zurich to renounce it altogether.

In 1516 Zwingli was transferred to Einsiedeln. It was then, and is still, resorted to by thousands of pilgrims yearly, who come to visit the famous image of the Virgin and Child which has been preserved there for at least a thousand years. Zwingli denounced the superstition of pilgrimages. His sermons made a great sensation and attracted attention in Rome. The papal curia had no wish to quarrel with the Swiss, who furnished them with troops, and sought to silence the Reformer by offers of promotion, which he refused. Soon afterwards he was elected, after some opposition, to be preacher in the cathedral at Zurich, and accepted the office (1518), having first obtained a pledge that his liberty to preach the truth should not be interfered with. He began the fight almost on his arrival. Bernhardin Samson, a pardon-seller like Tetzel, had been selling indulgences in the Forest Cantons and proposed to come to Zurich. Zwingli prevailed on the council to send the friar out of the country. In the beginning of 1519 he began a series of discourses on the New Testament Scriptures,—on St. Matthew's Gospel, on the Acts of the Apostles, and on the Pauline Epistles. The sermons, preached "in simple Swiss language," had a great effect. The Reformation in Zurich was begun. The council of the canton was on Zwingli's side and protected their preacher. He began to preach against fasting and other Roman practices; some of his followers put his precepts in practice and ate flesh in Lent. The bishop of Constance accused them before the council of Zurich. Zwingli was heard in their defence, and the accusation was abandoned. The victory on the subject of fasting was followed by an attack on the doctrine of the celibacy of the clergy. Pope Adrian VI. interfered, and asked the Zurichers to abandon Zwingli. The Reformer persuaded the council to allow a public disputation, which was held in 1523. Zwingli produced sixty-seven theses,[1] containing a summary of his doctrinal views, and argued in their favor with such power that the council upheld the Reformer and separated the canton from the bishopric of Constance. The Reformation, thus legally established, went forward rapidly. The Latin language was discontinued in the service; the incomes of chapters, convents, and monasteries were applied for education; the celibacy of the clergy was abolished; monks and nuns were freed from their vows; mass and image worship were declared to be idolatrous; and the Eucharist in both kinds was celebrated by a solemn communion of all the Reformed congregations on Maundy Thursday, 1525.

The progress of the Reformation in Zurich attracted the attention of all Switzerland, and the Confederation became divided into two parties. The Reformers found numerous supporters in the larger towns of Basel, Bern, and Schaffhausen, and in the country districts of Glarus, Appenzell, and the Grisons. The five Forest Cantons—Lucerne, Zug, Schwyz, Uri, and Unterwalden—remained solidly opposed to all reforms. This anti-Reformation party was also strong in the patrician oligarchies which drew papal pensions, and enriched themselves by the nefarious blood traffic denounced by Zwingli. The Zurichers felt it necessary to form a defensive league to prevent their Reformation from being crushed by force. They were especially anxious to gain Bern, and Zwingli challenged the Roman Catholics to a public disputation in that city. No less than 350 ecclesiastics came to Bern from the various cantons to hear the pleadings, which began on 2d January, 1528, and lasted nineteen days. Zwingli and his companions undertook to defend against all comers the following ten propositions:

(1) That the Holy Christian Church, of which Christ is the only Head, is born of the Word of God, abides therein, and does not listen to the voice of a stranger; (2) that this church imposes no laws on the conscience of people without the sanction of the Word of God, and that the laws of the church are binding only in so far as they agree with the Word; (3) that Christ alone is our righteousness and our salvation, and that to trust to any other merit or satisfaction is to deny Him; (4) that it cannot be proved from the Holy Scripture that the body and blood of Christ are corporeally present in the bread and in the wine of the Lord's Supper; (5) that the mass, in which Christ is offered to God the Father for the sins of the living and of the dead, is contrary to Scripture and a gross affront to the sacrifice and death of the Saviour; (6) that we should not pray to dead mediators and intercessors, but to Jesus Christ alone; (7) that there is no trace of purgatory in Scripture; (8) that to set up pictures and to adore them is also contrary to Scripture, and that images and pictures ought to be destroyed where there is danger of giving them adoration; (9) that marriage is lawful to all, to the clergy as well as to the laity; (10) that shameful living is more disgraceful among the clergy than among the laity.

These they defended to such purpose that the Bernese joined heartily in the Reformation, and the enthusiasm of the people was fired by two burning sermons preached by Zwingli from the minster pulpit to overflowing audiences. The two parties henceforward faced each other in Switzerland. The country was in those days a confederacy of republics, and yet was far from being a democracy. Most of the cantons were ruled by aristocratic oligarchies who had pensions from foreign Governments, and Zwingli's appeal had always been from an oligarchy of pope, bishops, and abbots to the congregation with the Bible in hand. He founded his religious Reformation on the congregation, and this of itself suggested that the state was nothing but the people. It so happened that those cantons which remained firmly attached to Roman Catholicism were the least powerful, and yet from historical position and the long custom of the Confederacy had the largest legal influence in the country. The Forest Cantons had been the earliest to free themselves. Isolated towns and districts after successful revolt had claimed the protection of these little republics, and the Forest Cantons governed by means

[1] *Cf.* Schaff's *Creeds of the Evangelical Protestant Churches*, p. 197.

of prefects a large number of places beyond their boundaries. This gave them votes in the diet or federal council far beyond what they were entitled to by their population and actual resources. These cantons felt that, if the Reformation and the political ideas it suggested spread, their supremacy would be overthrown and their rule confined within their own territories. Nor had they in their upland valleys seen the worst abuses of the mediæval church. They dreaded the Reformation. They persecuted inquirers after truth, and imprisoned, beheaded, and burnt the followers of Zwingli when they caught them within their borders. Zwingli, alone among Protestant leaders, saw that the religious and the political questions could not be decided separately, but were for practical statesmanship one and the same problem. His policy was to reorganize the Swiss constitution on the principles of representative democracy, to put an end to the unnatural supremacy of the Forest Cantons by abolishing the prefects and their jurisdiction, and by giving the larger cantons the influence in the diet which was due to their resources and population, and to do this at once, and if necessary by war. His counsels were overruled. Bern was anxious to treat the religious question separately, and to negotiate for religious toleration, leaving the political future to take care of itself. The course of history has fully justified Zwingli. The views of the peace party triumphed, and a religious truce was negotiated under the name of the first peace of Cappel, with guarantees on paper that there was to be toleration in religious matters. But no real securities were given. The provisions of the treaty were never carried out in the Roman Catholic cantons, where authorities were secretly preparing for war. Zwingli in vain proclaimed the danger and urged offensive measures. The Protestant cantons remained heedless to the danger. At length the storm burst. The Forest Cantons advanced (1531) secretly and rapidly on Zurich, with the intention of overcoming the Protestant cantons one by one. The Zurichers met their foes at Cappel, were outnumbered, and were defeated. Zwingli, who had accompanied the troops as field chaplain, and had stood among the fighting men to encourage them, had received two wounds on the thigh when a blow on the head knocked him senseless. After the retreat of the Zurichers, when the victors examined the field, Zwingli was found to be still living. He was not recognized, and was asked if he wished a priest; when he refused, a captain standing near gave him a death-stroke on the neck. Next day his body was recognized. "Then there was a wonderful running to the spot the whole morning, for every man wished to see Zwingli." He had in death the same eager, courageous expression which his hearers were accustomed to see on his face when he preached. A great boulder, roughly squared, standing a little way off the road, marks the place where Zwingli fell. It is inscribed with the words, "'They may kill the body, but not the soul': so spoke on this spot Ulrich Zwingli, who for truth and the freedom of the Christian Church died a hero's death, Oct. 11, 1531."

Zwingli's theological views are expressed succinctly in the sixty-seven theses published at Zurich in 1523, and at greater length in the *First Helvetic Confession*, compiled in 1536 by a number of his disciples.[1] They contain the elements of Reformed as distinguished from Lutheran doctrine. As opposed to Luther, Zwingli insisted more firmly on the supreme authority of Scripture, and broke more thoroughly and radically with the mediæval church. Luther was content with changes in one or two fundamental doctrines; Zwingli aimed at a reformation of government and discipline as well as of theology. Zwingli never faltered in his trust in the people, and was earnest to show that no class of men ought to be called *spiritual* simply because they were selected to perform certain functions. He thoroughly believed also that it was the duty of all in authority to rule in Christ's name and to obey His laws. He was led from these ideas to think that there should be no government in the church separate from the civil government which ruled the commonwealth. All rules and regulations about the public worship, doctrines, and discipline of the church were made in Zwingli's time, and with his consent, by the council of Zurich, which was the supreme civil authority in the state. This was the ground of his quarrel with the Swiss Anabaptists, for the main idea in the minds of these greatly maligned men was the modern thought of a free church in a free state. Like all the Reformers, he was strictly Augustinian in theology, but he dwelt chiefly on the positive side of predestination—the election to salvation—and he insisted upon the salvation of infants and of the pious heathen. His most distinctive doctrine is perhaps his theory of the sacrament, which involved him and his followers in a long and, on Luther's part, an acrimonious dispute with the German Protestants. His main idea was that the sacrament of the Lord's Supper was not the *repetition* of the sacrifice of Christ, but the faithful *remembrance* that that sacrifice had been made once for all; and his deeper idea of faith, which included in the act of faith a real union and communion of the faithful soul with Christ, really preserved what was also most valuable in the distinctively Lutheran doctrine. His peculiar theological opinions were set aside in Switzerland for the somewhat profounder views of Calvin. The publication of the Zurich Consensus (*Consensus Tigurinus*) in 1549 marks the adherence of the Swiss to Calvinist theology.

Zwingli's most important writings are—*Von Erkiesen und Fryheit der Spysen* (April, 1522); *De Canone Missæ Epichiresis* (September, 1523); *Commentarius de Vera et Falsa Religione* (1525); *Vom Touf, vom Wiedertouf, und vom Kindertouf* (1525); *Ein klare Unterrichtung vom Nachtmal Christi* (1526); *De Providentia Dei* (1530); and *Christianæ Fidei Expositio* (1531).

For his theology, compare Seegwart, *Ulrich Zwingli, der Charakter seiner Theologie*, 1855; especially Hundeshagen, *Beiträge zur Kirchenverfassungsgeschichte u. Kirchenpolitik*, 1864; Usteri, *Ulrich Zwingli, ein Martin Luther ebenbürtiger Zeuge des evangelischen Glaubens*, 1883; and A. Baur, *Zwingli's Theologie, ihr Werden und ihr System*, 1885.

For Zwingli's life, compare Oswald Myconius, *De Huldrichi Zwinglii Fortissimi Herois ac Theologi Doctissimi Vita et Obitu*, 1532; Bullinger, *Reformationsgeschichte*, 1838; Mörikofer, *Ulrich Zwingli*, 1867; and Stähelin, *Huldreich Zwingli und sein Reformationswerk*, 1884. Stähelin is also the author of the remarkably good article on Zwingli in Herzog-Plitt's *Real-Encykl.*, vol. xvii. (T. M. L.)

ZWOLLE, a fortified town of Holland, capital of the province of Overyssel, 55 miles by rail to the northeast of Utrecht, stands on the Zwarte Water, a right-hand tributary of the Yssel, a little above its junction with that river. On the side of the town next the railway station is the Sassen-poort, an old Gothic gateway of brick; but the town has few other historical monuments of interest. The large Gothic church of St. Michael in the market place, begun in 1406, contains a fine organ and a richly carved pulpit. The town has a considerable trade by water, and among its more important industries are shipbuilding, cotton manufacture, dyeing and bleaching, tanning, rope-making, and salt-making. The population in 1887 was 25,005.

Zwolle was first fortified in 1223 by the bishop of Utrecht. It afterwards became a free imperial city and a member of the Hanseatic League, and first joined the United Provinces in 1580. Three miles from the town on a gentle eminence stands the monastery of the Agnetenberg, where Thomas a Kempis lived for the greater part of his life. Terburg, the painter, was a native of Zwolle.

ZYMOTIC DISEASES (ζύμη, ferment), a term in medicine applied by some authorities to the class of acute infectious maladies. As originally employed by Dr. Farr of the British registrar-general's department, the term included the diseases which were "epidemic, endemic, and contagious," and owed their origin to the presence of some morbific principle in the system acting in a manner analogous to although not identical with the process of fermentation. A very large number of diseases were accordingly included under this designation. The term, however, has come to be restricted in medical nomenclature to the chief fevers and contagious diseases (*e.g.*, typhus and typhoid fevers, smallpox, scarlet fever, measles, erysipelas, cholera, whooping-cough, diphtheria, etc.). Although the name is held by not a few authorities to be objectionable on account of the theory it suggests, it is still made use of in the registrar-general's classification of diseases.
